Since its inception the American Medical Association has endeavored in every way to raise the standard of medical education, and as the result of its labors there has been constant improvement, particularly in recent years Not only are the graduates of today better qualified in the science of medicine than those of ten years ago, but they have a broader grounding in the general sciences as well These are decided improvements, but should not satisfy us As an Association, we should continue to urge and adopt every means which will better qualify medical men for their calling Improved laboratory and hospital facilities are now being made available to medical students in greater degree, and the standard of medical practice is accordingly raised Not enough attention is being paid, however, to the subject of hygiene, in either undergraduate or postgraduate courses Thus far the members of the medical profession have been looked to

---

* President s address before the American Medical Association at the Sixty Seventh Annual Session Detroit June 1916

as the natural conservators of individual and community health With the increasing interest in this subject, however, and the facilities for giving instruction in public health work being established in institutions other than medical schools, there is likelihood that in the future medical graduates will have sharp competition in a field which they should naturally occupy The time is at hand when localities and states will demand the services of full-time health officers, and the medical profession should look forward to meeting this requirement It is suggested, therefore, that the Council on Medical Education and the profession generally give greater attention to this growing need

MEDICAL AND SANITARY PREPAREDNESS

The American Medical Association, as a national body, has come to bear an important relation to everything medical which affects the nation as a whole It has, therefore, interested itself in the improvement of the Medical Departments of the Army and the Navy and the Public Health Service

The Medical Department of the Army is charged with the duty of preserving the sanitary condition of the army and with certain important functions of administration and organization In its relation to the people of this country by far its most important activity is along educational lines Some thirty to fifty thousand young men join the army each year, and a similar number annually pass back to civil life During the period these men remain in the army they come into direct contact with the medical department Their ideas and standards as to housing, food, clothing, ventilation and lighting are all materially influenced by their sojourn in the army, and even more definite impressions are acquired from the medical department with reference to such matters as disease and its treatment, preventive medicine, temperance and recreations At almost every point in his new environment the recruit comes into contact with the ideas and teachings of the army medical department, and he returns to civil life with a much broader and more enlightened view of hygienic principles

The great lesson of the European war which we as medical men should take to heart is the importance of thoroughly preparing the medical and sanitary forces in time of peace, so that they may be ready to take their proper place and to efficiently relieve the sick and wounded and prevent disease in time of actual conflict Not only must the land forces be put on the footing of highest efficiency, but it is perhaps even more important that the Medical Department of the Navy receive the active support of the entire citizenship The multifarious character of the duties of the medical corps of the navy requires officers of broad training This Association should continue in the future as in the past to afford to the Medical Departments of the Army and Navy every assistance in its power

The problems which confront the Public Health Service are of a different character from those of the strictly military arms of the government This organization is rapidly expanding to meet its duties in the protection of the health of the civilian population of the United States The crying need of the Public Health Service at the present time is men and money Congress has never been slow in imposing functions on the Public Health Service, but it has been extremely conservative in the matter of appropriations and increased personnel to discharge the added duties As yet, Congress has not seen fit to establish a national department of health, and pending the creation of that much-needed department, the Public Health Service must perform the public health duties of the nation It is incumbent on every citizen of this country who is interested in the conservation of human life to assist and cooperate with the Public Health Service

ENLARGEMENT OF USEFULNESS OF HOSPITALS

One of the extremely important matters in which this Association should take an active interest is the utilization of hospitals in order that they shall not only have greater application in the relief of illness, but be of greater utility in times of national stress

In many general hospitals there is opportunity to increase efficiency through organization It is probable, for instance, that the most accurate knowledge of the distribution of certain preventable diseases could be obtained by regular reports from hospitals and dispensaries if these were comparable Moreover, it should become possible in greater degree to admit many cases of illness, such as tuberculosis and venereal infections, now excluded, but which profoundly menace the public health Hospitals are public servants and as such should be utilized to the fullest extent, not only in the relief of illness, but also for educational and public health purposes

IMPROVEMENT AND STANDARDIZATION OF REMEDIAL PREPARATIONS

Further effort should be made to determine the availability and use of remedial preparations The remarkably valuable work of the Council on Pharmacy and Chemistry is well known to you As a result of its untiring efforts for more than a decade, our knowledge of useful remedies has been increased, the Pharmacopeia improved and the physicians' armamentarium made more serviceable Much, however, remains to be done The determination, for instance, of the value of biologic products used in the prevention and treatment of the diseases of man and the elimination of those which are without worth is a matter of urgent need, meriting the earnest consideration of this Association While it is the province of the federal government to promulgate standards for these preparations, the determination of their therapeutic value is a function of the medical profession

In the enforcement of the law regulating the propagation and sale of viruses, serums and toxins, it is possible for the Public Health Service to guard against the sale of contaminated preparations It insures to physicians the full strength of those preparations for which standards have been devised, but it cannot guarantee the potency of preparations for which standards have not been fixed, and which practitioners generally are being urged to use in greater degree In order to determine this potency, the medical profession has a duty to perform

By encouraging therapeutic research along broad lines through hospitals and clinical laboratories, the Council on Pharmacy and Chemistry would facilitate the standardization of useful biologic preparations and restrict the exploitation of doubtful ones, thereby saving millions of dollars annually to the country I would accordingly suggest that this be made the subject of intensive study, thus supplementing the researches already under way in respect to other preparations

Through its helpful attitude, the medical profession has contributed to the enforcement of the antinarcotic law. As a result, a multitude of data are being recorded to show not only the public health importance of the control of habit-forming drugs, but the additional measures that are necessary to this end. I doubt if any of us here present comprehend fully the social and sanitary significance of this vast problem and the relation of individual practitioners thereto. It should be our earnest effort to aid in restricting the use of narcotics for other than medicinal purposes, and thus aid in overcoming an evil of the gravest menace. While as an organization we may not influence specific legislation, it is entirely within our province to strive to mold public opinion, which will beget wise laws and proper provisions for their enforcement.

HEALTH INSURANCE

As a result of recent workmen's compensation laws and the increasing interest in the health of wage-earners, the subject of health insurance is rapidly coming to the front. This is a question which we as a profession will be called on to face in the not very distant future.

Studies of the economic and sanitary conditions affecting the health of the industrial population have shown the urgent need for more effective methods for the relief and prevention of disease among the 30,000,000 of persons who comprise this group. The unskilled, low-paid workers in every community have an excessive morbidity and mortality rate, which is largely accounted for by their economic status and living environment. A large proportion of this class have incomes insufficient to maintain healthful standards of living, much less to provide adequate medical and surgical care. This places a serious handicap on the medical profession, as well as a financial burden on the poorly paid wage earner, which neither should be wholly required to bear. The public, industry and the workers themselves are at least partially responsible for the faulty conditions, and in consequence should share in the remedial measures.

To meet the situation, there are unmistakable signs that health insurance will constitute the next great step in social legislation. Experience has shown that an adequate health insurance system should distribute the cost of sickness among those responsible for conditions causing it and thereby lighten the burden on the individual. Financial incentive may thus be given for the inauguration of comprehensive measures for the prevention of disease. I would accordingly suggest that the American Medical Association continue the studies, which have been as splendidly begun, of the results of health insurance in all its aspects in this and in foreign countries, so as to decide on a program which would properly coordinate any proposed health insurance system with existing agencies for the cure and prevention of disease.

INDUSTRIAL HYGIENE

Closely allied to this is the study of industrial hygiene, a subject which will receive careful consideration in the Section on Preventive Medicine and Public Health at this session. Too many safeguards cannot be thrown about the health of operatives in industry, but we should consider the problem as it relates, not only to the workshop and factory, but to home conditions as well. Factory sanitation will fail of the highest accomplishment unless the workman is educated in the hygiene of his body and the sanitation of his home. The relation of the wage to disease, the housing problem and the health training of operatives are therefore matters which I would commend to the attention of the Council on Health and Public Instruction.

RURAL SANITATION

Rural sanitation is a matter of even greater importance. Over 53 per cent. of the population of the United States dwells in communities of less than 2,500 inhabitants, in many cases under most insanitary conditions. This is a menace not only to the health of the rural dweller, but also to that of the urban resident. The next great point of attack against infectious diseases is the small town and village. The work which the Public Health Service has been carrying on in cooperation with state and local health authorities in rural counties shows not only the necessity for increased and more widespread activity in this direction, but also that great good may thus be accomplished at relatively little cost. It is incumbent on this Association, possessed as it is of the machinery for popularizing health movements, to undertake a definite campaign for bringing health education to our rural population. If this is well done there will be a direct result in the reduction of typhoid fever, malaria and hookworm disease in the country and an increased safety in the food supplies of cities. I cannot too strongly urge on this body the necessity for intensive efforts toward the improvement of rural sanitation.

PUBLIC HEALTH ORGANIZATION

In the accomplishment of this purpose, however, we cannot stop with the sanitary enlightenment of the country inhabitant. Much he can and must do for himself, but lasting good cannot be accomplished in the absence of adequate state and local health organizations. An examination of existing laws and regulations shows that some of the states have an abundance of public health legislation. In fact, in many instances the powers and duties of the sanitary authorities far exceed the appropriations for their execution. Still others have defective laws and low appropriations, while some have little law and almost no appropriations.

In many instances considerable improvement in organization will be necessary before health authorities can functionate properly. These defects are being remedied, and many states are rapidly approaching a high degree of efficiency in their public health administration. In the counties and small municipalities, however, the greatest need for reform exists, and this Association should cooperate to the fullest extent in creating a public sentiment for thoroughly prepared, adequately salaried, full-time health officers. Indeed, it should not only create such sentiment, but, as previously stated, it should take active steps to provide without delay a large share of these public servants. The production of well-qualified men for such positions is not keeping pace with the demand. Sanitation is as much a specialty as is surgery, and simply because a physician is a successful practitioner is no guarantee that he will make a qualified health officer.

Through improved medical education and the cooperation of health departments with universities, properly qualified physicians should become available to meet this growing need. It is important also that states and localities should be able to secure the services of sanitarians without reference to legal residence. It is equally as important that medical hygienists, as well as physicians generally, should be able to practice their profession anywhere within the confines of our country without undue restriction as to academic examinations It is not at all improbable that this thought imbued our late President in founding the National Board of Medical Examiners This body, which promises so much benefit both to the medical profession and to the American public, stands as a monument to the industry and clarity of vision of our lamented colleague, Dr William L Rodman I would commend to the Council on Medical Education the study of the problem of devising some uniform means of certifying and training prospective health officers

The great effort of the future must be in the direction of the improvement of the internal health of the nation We are possessed of an adequate coast defense against disease from abroad, and what we must now do is to control those diseases which are already with us In this we require the qualified health officer and the educated public A part of this education may be secured by the printed and the spoken word, but the great agent in public education is demonstration This Association is in a position, touching as it does every stratum of society in this broad land of ours, to carry this work forward to ultimate fruition This is an obligation on our profession, a sacred duty laid on the followers of the healing art Though we minister to the sick and bind up the wounded, though we bring sight to those who see not and alleviate the suffering on the bed of pain, yet our duty is not done until we have put forth our best endeavor to the end that sickness and pain and blindness be not Poverty and ignorance, squalor and intemperance, cruelty and greed, these are the enemies which we as individuals and as a profession must combat As citizens who would maintain our nation in a condition of preparedness against its greatest enemy, disease, it is our duty to perform not only our legal obligations as physicians, but to bend our every energy to the prevention of disease No selfish or half-hearted service will suffice Nothing short of whole-souled devotion to this duty will satisfy the ideals which have been passed down to us by generations of self-sacrificing, public-spirited physicians who love their fellow men The American Medical Association represents the crystallization of these ideals If it permits no self-seeking interest to dominate its actions, if it maintains its plane of high altruism, if it devotes itself with strength of purpose to the betterment of the public weal, it will prosper in the future as in the past, serene and sure in the satisfaction of work well done Let our deliberations be so imbued with that broad spirit of charity and brotherhood that the name of the physician shall be revered

---

Beriberi.—Eykman, in 1897, called attention to the fact that the disease beriberi was prevalent among those rice-eating nations which partook of rice prepared in a certain way The Bengali eats unpolished rice, that is, rice of which the red husk or pericarp has not been removed, and he does not suffer from beriberi When the native of the Philippines pounds his rice in a large mortar with his own hands, the milled product is never so thoroughly freed of its husk as happens to that milled by machinery, and hence these natives are partly protected from the disease A diet which is based almost exclusively on white rice causes beriberi with certainty Eykman also found that when chickens or pigeons were fed on white rice they developed a disease similar to beriberi General weakness, with paralysis of the legs and wings, due to a polyneuritis, developed, which could be cured by a change in diet —Graham Lusk, The Fundamental Basis of Nutrition

DISPENSARY ABUSE AND CERTAIN PROBLEMS OF MEDICAL PRACTICE *

J WHITRIDGE WILLIAMS
BALTIMORE

It is with great pleasure that I preside over the one hundred and eighteenth annual meeting of the Medical and Chirurgical Faculty of Maryland, and I take this opportunity to thank my friends for the honor which they have conferred upon me The Faculty means more to me than to many, for I was brought up in its atmosphere, and among my earliest recollections are some of the conferences held in my father's home, incident to its reconstitution after the close of the Civil War Consequently, I esteem it a peculiar privilege to occupy the chair which my father once held, and I can assure you that in doing so I recall affectionately many of our departed members, whom some of us can visualize vividly, but who represent mere names to the majority of those present While many of them knew less medicine than we, they strove for ideals which, if anything, were higher than ours, and it is with a sense of reverent affection that I acknowledge my obligations to many of them

I propose to address you briefly on "Dispensary Abuse and Certain Aspects of Medical Practice," a topic which I have selected for two reasons first, because several members of the Faculty have asked me to use my influence to check the so-called abuse, and, secondly, because my interest in medical education has caused me to consider seriously how the medical care of the poor can be best effected in the interest of the community and of the medical profession Furthermore, an apprenticeship of several years as director of the Johns Hopkins Dispensary, and years of service as a member of the Board of Charities of Baltimore City have given me an insight into many of the problems concerned I shall speak frankly on the subject, for, between my grandfather, father and myself, I have behind me the traditions of ninety six years of continuous practice of medicine in this city, which should enable me to face the problem more sympathetically than a mere layman, or even than a physician who bases his conclusions solely on his own experience

During this century Baltimore has grown from a village to a great metropolis, and the practice of medicine has undergone equally great changes

As a boy, I remember that the only specialists in the city were a few men who devoted themselves to the treatment of diseases of the eye, and that every one else, even the surgeons, practiced general medicine, including obstetrics At that time there were few hospitals, and they so crude that no one thought of using them, except the stranger within our gates, the friendless man and the abject pauper Hospital fever still raged, so that the few major operations, which the surgeon thought to be indicated, were performed in the patients' homes The few dispensaries were rudimentary and dirty, and, as their name implied, were places for the dispensing of drugs rather than for the investigation and cure of disease I think that I am safe in stating that fifty years ago no dispensary was equipped for a thorough physical examination of its patients Trained nurses were unknown, but "Sairey Gamps" were familiar figures, and a serious illness was usually followed by the collapse of several female relatives of the patient who had volunteered their willing, but inefficient, nursing services. Organized charity had not been dreamed of, and the beginnings of social service were still a generation distant.

---

* Presidential address delivered before the Medical and Chirurgical Faculty of Maryland, April 25, 1916

The town was small, and the physician had a patriarchal sense of obligation to his neighbors and the feeling that he was really a public servant. I know that my father and grandfather held that it was their duty to respond to any call, and to refuse to visit a poor patient from whom a fee could not be expected represented the sin which could hardly be forgiven. Up to the time of his death, my father never refused his services to such patients, and I well remember hearing it said in my boyhood that a certain man, who later attained great eminence in the profession, had a "fine line of darky practice."

With the growth of the city, the expansion of medicine, the development of specialists, and particularly with the extended organization of hospitals and dispensaries, together with the development of trained nursing and the various social agencies, all this has changed, and the old fashioned, kindly and self-sacrificing family physician has disappeared, never to return. Now, except for distinctly personal reasons, no city physician has any hesitancy in refusing to attend undesirable or unremunerative patients, but refers them to the nearest hospital or dispensary, and feels that he will give his charity the next day in the shape of a few hours of hospital or dispensary service rendered under the least onerous conditions. Doubtless the patients are better off and receive more efficient treatment than ever before, but I sometimes wonder whether our moral status is as fine as that of the old worthies who were members of the faculty before many of us were born, and whether it is well for those of us who have attained prominence in our profession to see poor patients only in the wards of the hospital.

These changes in the conditions surrounding the practice of medicine constitute one of the causes of the so-called dispensary abuse. What is the abuse? As I understand it, general practitioners living in the less prosperous sections of the city complain that a certain proportion of persons in moderate circumstances take advantage of institutional facilities, which were primarily intended for the very poor, and thus escape the payment of fees which they might otherwise earn. Again, young men who are perfecting themselves in some specialty claim that large numbers of persons are operated on without charge in hospitals or dispensaries when they could afford to pay a moderate fee.

Undoubtedly both of these conditions obtain to some extent, but in my experience they are less general than is commonly believed, and when they occur they are due less to the desire to escape the payment of fees than to the hope of obtaining better treatment. This opinion is based on the following considerations. In the first place, the prosperity of industrial workers is in general overestimated, as the great majority of married workers scarcely earn enough to support a family with the greatest economy. Scott Nearing has estimated that one half of all industrial workers in this country earn less than $600, and three quarters less than $750 per year, while less than one tenth earn as much as $1,000. In my experience, married workers who earn less than $750 a year cannot afford to make any considerable expenditure for medical services. Consequently, it becomes apparent from the figures just quoted that not more than one fourth of all industrial workers can be involved in dispensary abuse, and I believe that physicians practicing among that class of our population will testify that considerably more than that proportion make an honest attempt to pay for medical services. In the second place, I do not believe that there is much abuse among the small clerk class, as investigation will usually show when its members apply for dispensary aid that prolonged illness or financial reverses have so impaired their ability to pay that they are, temporarily at least, worse off than those who all agree are entitled to assistance. In many other instances they have exhausted their available resources in paying physicians for inferior services, and, as a last resort, go to the dispensary in search of better treatment. On the other hand, I am prepared to admit that a considerable number of patients who could afford to pay a small fee to some young specialist resort to hospitals and dispensaries for free operations.

Consequently, while it may be admitted that glaring instances of abuse are occasionally encountered, it is my experience that the greater part of the so-called abuse is due less to a desire to escape the payment of fees than to the realization that the sick frequently receive inadequate services from their physicians. This is partly the result of poor work by imperfectly educated practitioners, and is partly attributable to the increasing complexity of medical practice, in which the knowledge of one man, no matter how extensive, no longer suffices to establish a diagnosis or to lead to the rational treatment of many conditions. Who can blame a well paid worker or a clerk in modest circumstances for seeking dispensary aid after he has compared notes with less favored friends, who have utilized the services of a well organized dispensary? The former knows that he has been long treated by his physician without relief, and that all he had received for his money was to have his pulse felt, his tongue inspected and to receive a prescription, while the latter will relate that in his case a thorough physical examination had been made, the blood and urine examined, and possibly a Roentgen-ray picture taken or the stomach contents analyzed. The first man must inevitably feel that he has been neglected, while the second realizes that all of the resources of science have been utilized in the investigation of his malady. Whether his symptoms have been relieved is another matter, but until human psychology has radically changed, the result of the comparison is inevitable.

Or, to choose an example from my own work, let us take the wife of a workman whose wages are $15 a week. She is to be confined and expects to pay a fee commensurate with her circumstances. She engages her doctor, who neglects her during pregnancy, attends her at the time of labor, makes a few postpartum calls and sends his bill at the proper time. Later she compares notes with a friend whose husband's wages are $10 a week and who was attended by a well conducted outpatient obstetrical service. She is told that at the first visit to the dispensary a thorough physical and pelvic examination was made, and that a few days later a tactful nurse called at her friend's home and inquired into her conditions of life, advised her concerning the hygiene of pregnancy, and instructed her to return to the dispensary at the end of each month for inspection, advice and a urinary examination. Furthermore, she hears that three days after failing to follow these instructions, her friend received a post card reminding her of her omission, but having postponed the visit the nurse again called, and so impressed the patient with the importance of prenatal care that each month thereafter she gladly went to the dispensary to consult the doctor Then our woman is told that four or five weeks before the expected date of confinement her friend received another visit from the nurse, who called to ascertain whether suitable preparations had been made for the birth of the baby She is also told that the labor was conducted by a bright young doctor, a student and a nurse, and that for the next ten days a daily visit was made by the student and the nurse And finally, that a few days after these visits had ceased, the social service nurse called again to inquire as to the treatment she had received, and to arrange for the supervision of the baby during the following year

When our woman has heard this recital, and has compared the treatment which her friend received for nothing with that for which she paid her physician, can she be blamed for feeling that she did not have a fair deal, and for wanting to become a dispensary patient should she become pregnant again? And are the best interests of the community served if she is prevented from so doing?

Naturally, the physician concerned will reply that the value of his services was far in excess of the fee he had received, that it is not fair for a philanthropic institution to offer services with which he cannot compete, and that it is immoral to educate patients to expect services far in excess of what their means can command Were we concerned solely with the interests of the physician, only one reply would be possible, but, on the other hand, when the subject is approached from the point of view of the community, a different answer must be given for no one not blinded by self interest would contend that it is not highly advantageous for all classes of the community to obtain the best possible medical and nursing care

Accordingly, for the sake of argument, if you please, we shall admit that as dispensaries continue to improve, a larger and larger contingent of the working classes will avail themselves of their benefits, and that the question of dispensary abuse will come to be limited to those who earn more than $2 50 a day Furthermore, the only means of limiting the more extended utilization of dispensaries will consist in hampering their development by lack of means and by the absence of idealism in the conduct of their work

It would lead too far afield to consider critically at this time the proper organization and scope of dispensaries[1] I cannot, however, leave the subject without briefly directing your attention to several points which I believe are fundamental to the organization and conduct of a well regulated dispensary In the first place, it should be an integral part of a well organized general hospital, or, when that is not feasible, it should be closely affiliated with such an institution, so that all the facilities of the latter may be promptly available for the treatment of seriously sick patients The dispensary should be provided with adequate facilities, should have a suitable nursing staff, and above all a well organized social service department, as, in my experience, the work done by the latter adds to the comfort and education of the patients quite as much as the strictly medical service In the second place, poorly run and inadequately equipped dispensaries should not be tolerated and should not receive public support Complaints of dispensary abuse are rarely made concerning such institutions, as they are patronized only by the most ignorant stratum of the community, do little good to their patients and lead to rapid deterioration and loss of clear thinking on the part of their medical staff Furthermore, I feel very strongly that in order to insure a high type of medical work, even in good dispensaries, it will be necessary to pay suitable salaries to all physicians who are expected to give several hours each day to the routine care of patients Otherwise, the work must be done by constantly changing groups of young men, who tend to become slack in interest and attendance as soon as they realize that they have mastered the details of their work

In other words, I am pleading for the maintenance of dispensaries of the highest type, with the knowledge that the better they become, the greater will be the cry of dispensary abuse, which to my mind will not disappear until the conditions of medical practice in our large cities have undergone radical reorganization

I can be much briefer concerning the second variety of dispensary abuse, namely, free operations on persons who can afford to pay a small fee. In my experience this class of patients frequently consult the young specialist in his office and pay a fee for his advice, but when they learn that an operation is necessary they go to a dispensary or hospital As far as I am able to ascertain, one of two motives leads to this action a feeling that the operation will be better and more safely done at the hospital, or a desire to escape the payment of an operative fee In neither event should the patient be treated free, but a mechanism should be devised for the investigation of his circumstances and the charging of an equitable fee by the institution In many cases such a fee will cover only the outlay for anesthesia, supplies, and a few days' stay in the hospital, but in other instances a balance will be left for the payment of professional services Naturally, this balance will be so small that the operator could not accept it as a fee without a distinct loss of self-respect, so that the question arises as to its disposition If the matter were properly handled, I feel that the aggregate of such fees would be considerable, and that such money, along with other available funds, could be utilized for the payment of moderate salaries to the members of the staff who do the work, with the understanding that the salary was in lieu of all fees from patients, except those occupying private rooms at full rates

While such an arrangement would not put the fees into the pocket of the young specialist, who is complaining of dispensary abuse, it would do away with an unjustifiable abuse of charity and would compel the patient to pay what he could afford for operative treatment

With the increasing complexity of medical knowledge, the development of specialists, the necessity for their cooperation in the diagnosis and treatment of many conditions, and the relatively high fees which they are compelled to charge, another serious question arises, and that is, how is the individual of moderate means, who is self-supporting and self-respecting, but who cannot afford to expend $50 to $100 in payment of specialists, to obtain the necessary diagnosis?

---

[1] I would refer those interested in this aspect of the subject to the report on The Function of the Dispensary, which was made at the 1916 meeting of the Association of American Medical Colleges

I believe that this will eventually be effected by the establishment of pay dispensaries, somewhat similar to the one inaugurated at the Massachusetts General Hospital in Boston on Jan 1, 1916 In such institutions a group of thoroughly competent young men representing the various specialties will come together on certain evenings each week and will be prepared to examine such patients as may apply The patient should be accompanied by his physician, or at least bring a letter from him asking for a report, and should not be treated except on his direct request A fee of from $10 to $25 should be charged for the complete examination, and the dispensary staff should be compensated either by fixed salaries or by a pro rata division of the fees after a proper deduction has been made for maintenance charges

While the suggestions which I have made may appear radical to some of you, I feel that they barely scratch the surface of the question, and even if adopted, would prove to be but temporary expedients, as I consider that our entire system of treating illness is defective and cries out for radical revision

That something is seriously wrong becomes apparent when a man like Cabot of Boston feels it necessary to contribute to a lay magazine an article entitled "Better Doctoring for Less Money" I earnestly recommend you to read it, as I am sure, whether you agree with what is said or not, that you will admit that the author has put his finger on a sore spot and has raised questions which demand solution

As medicine is now organized, only three classes of our population receive the best institutional care, namely, the rich, the pauper, and those who are willing to abuse medical charity, but no adequate provision is made for the care of the great middle class, which forms the self-respecting backbone of our nation The consequence is that additional terrors have been lent to illness, more particularly when operative treatment becomes necessary for its relief Ask any man with an income of from $1,500 to $4,000 what it cost him to be relieved of his appendix, or to have his wife treated for a complicated nervous breakdown, and you will have the question clearly set before you Only recently a prominent banker told me that I would be surprised, did I not already know, what an appalling condition exists and what a large proportion of our self-respecting citizens are compelled to ask long-term loans in order to tide them over such emergencies The result is that the old feeling of personal friendship for the doctor is fast disappearing, and each year an increasing number of persons come to regard him as one who is likely to take advantage of their necessities I shall not dwell further on this aspect of the question at this time, but I shall return to it before closing

On reverting to the question as it affects the working classes, I feel that the present system of free dispensary and hospital treatment is based on fundamentally incorrect principles As it now is, except for a nominal charge of 10 cents for each prescription filled, the maintenance of such patients is borne by the interest on endowment funds, contributions by charitable persons, and subventions from the city and state, so that for practical purposes the recipients of such aid are as much paupers as the inmates of the poorhouse, the only difference being that the former are temporary and the latter permanent paupers Consider, for example, the case of a workman earning $3 a day Ordinarily he should be able to pay the necessary expenses of himself and his family But let him have a prolonged illness, his pay stops, his small savings are soon exhausted, and he applies to the hospital for relief He is admitted without question as a city patient, if the institution has a contract with the board of charities, and the cost of his maintenance is then borne partly by the city and partly by the institution, which in turn may be the recipient of state aid The individual may not realize it, but he has become a pauper patient, and is the recipient of charity, just as much as the beggar on the streets

For the year 1916 the city of Baltimore and state of Maryland are contributing $1,200,000 for the relief of suffering inhabitants of Baltimore, including the insane and those suffering from tuberculosis, while private philanthropy and charity is giving still more Much good of course is effected by the expenditure of this money, but still larger amounts are necessary if the work is to be well done, yet a large part of it goes to pauperize patients who should in great part be able to help themselves, and this will continue to be the case until some mechanism is developed which will make it possible for the wage-earner and the small-salaried man to accumulate a reserve, during the period of productive activity, which will serve, at least in part, to defray his expenses during illness In other words, I believe that our problem will never approach a definite solution until some form of sickness or health insurance is made compulsory on all who earn less than $1,000 or $1,200 a year

As is well known, such insurance is in vogue in all European states, and is conducted either by the state, or at least is under its supervision In France, Germany and Scandinavia it is voluntary and is conducted by private local societies under the strictest governmental control In Germany the system has been in operation for over thirty years, and while nominally voluntary, is practically compulsory, and covers all persons whose income falls below $625 a year The individual societies are designated as *Krankenkassen,* which are held in bad repute among medical men in this country on account of the difficulties which they have had with the physicians These disputes were in great part inevitable, as the societies were originally managed entirely by laymen from the less intelligent classes, who attempted to ignore the medical profession and to pay as little as possible for its services Latterly, however, a more liberal spirit has become manifest, so that representatives of the physicians practicing in the various communities now take part in the deliberations of the boards of control

From what I have learned by personal inquiry in Germany, as well as from Gibbons' "Medical Benefit in Germany and Denmark," the general effect of this system is excellent, in that the medical needs of the working classes are in great part paid for by their own contributions Moreover, another aspect of the system impressed me greatly, and that is, as the *Krankenkassen* pay, either entirely or partly, the expenses of their members while undergoing hospital treatment, the German working man regards the hospital very differently from the American, and, instead of feeling that he is there on sufferance as a pauper, considers that he is a pay patient and is entitled to great consideration I know that it will surprise many to learn that in autocratic Germany it is not unusual for patients to complain of their treatment, and the influence of the *Krankenkasse* is such as to insure a respectful hearing, and furthermore that such patients cannot be utilized for purposes of instruction, unless they give their consent.

In Russia and England, on the other hand, sickness insurance is compulsory, and the National Health Insurance Act, which Lloyd George forced on the latter country in 1911, is in many respects a model for such legislation, and should be read by all intelligent persons.

Under the act, which Lloyd George prefers to call *health insurance*, as its object is to promote the health quite as much as to provide care for the sick, all persons, with certain exceptions, in receipt of a yearly income of $800 or less must insure. During the period of insurance weekly payments of 9 pence are demanded, of which the state contributes 2 pence, while the remaining 7 pence are paid by the workman and his employer in proportions varying according to the amount of wages. When these are very small the entire contribution is paid by the employer, but when large, entirely by the workman.

The funds are handled in two ways: in great part by acceptable friendly societies, which are under strict governmental supervision, while in the case of persons who are not members of such societies, the matter is entirely in the hands of the government. It would take more time than is at my disposal to go into the details of the scheme, and I shall merely state that it provides for medical, sickness, disablement, and maternity benefits.

Naturally, we are most interested in the medical benefit, and under this the insured are guaranteed medical treatment at the physician's office, in their own homes, or in sanatoriums or hospitals, according to the exigencies of the case, together with such nursing as may be essential, and the necessary medical and surgical supplies. In each community all reputable physicians are entitled to go into the scheme, and such as agree to do so are placed on a panel and are paid according to a fixed schedule for such services as they may render. The insured may select any physician on the local panel and must retain him for a specified period of time, except for good and sufficient reasons, while the physician may refuse to accept any patient he pleases, but once having accepted him must respond to his calls until the time agreed upon has expired.

This system has been in operation too short a time to justify an authoritative verdict as to its merits, but so far as I can ascertain it has proved acceptable to the physicians, as statistics show that over nine tenths of the general practitioners are enrolled on the panels, and, as a result of doing away with gratuitous services, their average income has shown a very considerable increase.[2]

I feel that some such system must ultimately be adopted in this country, and that the question of dispensary and hospital abuse will not disappear until after it has been put into operation. Owing to our political organization, the necessary legislation must be inaugurated by the individual states, instead of being nationwide, as in Great Britain.

Of course it may be urged that legislation of this kind is socialistic, and is contrary to the individualistic tendencies characterizing American life, and could never be carried out in this country. The first objection must be granted, but it is my conviction that it is only along such lines that far reaching plans for the improvement of mankind can be carried out. The second objection, however, does not hold, as a little reflection will convince you that many socialistic or semisocialistic activities have already become engrafted on our civilization without arousing the outcry that they are un-American. Witness, for example, the beneficent effects of state care for the insane in Maryland, and the substitution of well-equipped and humanely conducted state hospitals for the county almshouses. What intelligent person would advocate a return to the old conditions? Yet the former is socialistic and the latter individualistic. Recall, moreover, the various ways in which the state and city have invaded our individual freedom for the good of the community. Think of what the state and city boards of health are doing. Would any one advocate the abolition of full-time health officers, or of attempts to control infectious diseases, or to do away with the infectious disease and tuberculosis nurses of the city health department? Medical socialism has also invaded our schools, but does any one complain that the activities of the school physicians and nurses are un-American? To my mind all of these tendencies are to be encouraged, as fostering the health and happiness of the community, and as a manifestation of the tardy recognition by the state and city of the obligations they owe to the people.

One of the most striking examples of the spread of social legislation consists in the enactment of workmen's compensation laws, which are based on the conception that loss of life and injury to the body in industrial occupations are to be reckoned just as much a part of the cost of production as the wear and tear and replacement of machinery or as the damage to wagons and mules. Up to December, 1915, thirty-one out of our forty-eight states, as well as Alaska and Hawaii, had passed such laws, which have done away with the barbarous doctrine of contributory negligence, and have provided some form of compulsory insurance in the case of injury or death, instead of the employee or his dependents being compelled to resort to the uncertain remedies of the law.

Do you know that the legislature of 1914 passed such a law for Maryland? According to this law, all employers of persons engaged in hazardous industrial work — and the definition of hazard is very broad — are compelled to insure them against accident and death. These policies, which are written either by private corporations or by the state, make provision for medical and surgical treatment, in case of permanent or partial disability, provide for the payment of half wages for specified periods of time, and in case of death, provide for funeral expenses and for the payment of either a fixed sum or an annuity to the dependents. Of course such legislation is socialistic, but what right thinking person would advocate a return to the old method of compensation only after tedious and tortuous legal procedure?

Furthermore, the legislature which has just adjourned has passed a mother's pension law, according to which all dependent widows in the state with minor children are entitled to receive from $12 to $40 each month, according to the size of their families. This legislation has not yet come into force, so that its effect cannot be anticipated, but it affords an accurate indication of the attitude of our lawmakers toward such questions.

---

[2] Full information concerning the workings of health insurance in Great Britain may be obtained from the fourth edition (1914) of Carr, Garnett and Taylor's monumental work on National Insurance, while a short but accurate sketch is contained in the Report of the Judicial Council of the American Medical Association, published in the Bulletin for May 15, 1915.

One of the most interesting developments along these lines was the decision in 1909 of the Metropolitan Life Insurance Company to provide its industrial policy holders with free visiting nursing services during illness. Baltimore was one of the first cities in which the experiment was tried, and a contract was made with the Instructive Visiting Nursing Association to care for sick policy holders at so much per visit. This service has rapidly grown, and the company states that during the year 1914, 1,060,288 nursing visits were paid in this country and Canada at an expense of $527,861. While it is not permissible to scrutinize too closely the motives which induced the company to embark in the enterprise, it has doubtless saved much money by shortening the duration of sickness, and at the same time it has indicated an excellent method of improving the condition of the community, as the nursing service, in addition to adding to the comfort of sick policy holders, must exert a widespread educative influence.

I think, therefore, that it can be fairly claimed that the instances just adduced give a fair indication of the trend of social legislation in this country, and that I am not alone in my advocacy of some form of health insurance is shown by the fact that Dr. Alexander Lambert, in the report of the Judicial Council of the American Medical Association last year, stated that the question was not merely of academic interest, but predicted that it might at any time become a burning professional problem.

This prediction has in part come true, for in November, 1915, the social insurance committee of the American Association for Labor Legislation prepared a tentative draft of a health insurance bill to be submitted to the New York legislature, and which was also intended as a tentative model for other states contemplating such legislation. The committee consisted of ten members, and included such men as Drs. Alexander Lambert and S. S. Goldwater, and Messrs. Ed. T. Devine and I. M. Rubinow, the latter being a statistical expert and the author of numerous works on the history of social insurance. It would lead too far to attempt to discuss the provisions of this bill in detail, and I can only summarize its most important features.

The draft provided that all persons earning less than $1,200 must be insured, and recommended that one fifth of the yearly premium be borne by the state and the remainder equally divided between the employer and the employee. The committee estimated that the premium necessary to provide for the family would amount to 3 or 4 per cent. of the income, and calculated that $24 paid in behalf of a workman earning $600 a year would suffice to provide the following benefits: (1) medical, surgical and nursing benefit, (2) medical and surgical supplies, (3) hospital treatment, (4) cash benefit (two thirds of wages), (5) cash benefit to dependents, (6) maternity benefit, and (7) funeral benefits. After carefully weighing the pros and cons, the committee decided that in so large a state as New York it would probably be better to have the details administered by local approved societies, under strict state supervision, rather than by a central state organization, although it was clearly realized that the latter would present many advantages, particularly in the direction of uniform administration.

If some such system were put into effect in Maryland I imagine that it would operate somewhat as follows in Baltimore City. In the first place, a panel of physicians would be formed, just as in England, and a schedule arranged for their compensation. The entire city would then be divided into a number of insurance districts, each comprising so many thousand insured persons. In each district there would be a thoroughly organized dispensary with a competent paid medical staff representing the various branches, adequate nursing facilities, and a social service organization. If possible it should be connected with a hospital, but if not, the necessary affiliations could be made. The dispensary should also house representatives of the various philanthropic and social agencies, and provide quarters for the local administrators of the health insurance fund, as well as for a substation of the health department. In other words, it would represent a community health center, and from it should radiate all the medical and socialized activities of the district.

The care of the patients might be organized somewhat as follows: Each insured family would be allowed to choose as its medical attendant any physician on the panel living within a certain radius. In cases of minor illness the patient would visit the physician in his office or go to the dispensary, while in more serious cases he would go to the dispensary for diagnosis or treatment. If the patient were ill in bed, he would be cared for at home by his medical attendant and a visiting nurse, or sent to the hospital if the physician deemed it advisable.

Under such a system there would be no possibility for dispensary or hospital abuse, as the expenses would be borne by the insurance fund and indirectly by those insured, no matter whether the patients were treated at home or at the dispensary or hospital. Nor would the doctor suffer. As probably two thirds of the residents of each district would be in the insured class, large numbers of physicians would be necessary for the conduct of the dispensary and hospital, and as they would be paid for such services, as well as for visiting the patients in their own homes, and would have no bad bills, they would probably consider it a matter of indifference where the patients were seen.

It is my conviction that a plan conducted somewhat along these lines would result in greatly improved medical service for the insured class, and at the same time would tend to elevate the professional standard of the physicians, as they would be stimulated by constant contact with the accurate work of the dispensary and hospital, instead of feeling, as is now so often the case, that their interests are antagonistic.

This would mean that the great majority of physicians would become state officials and would devote their entire time, or at least a considerable proportion of it, to their official duties, and that the present type of medical service would be available only for the rich and for those in comfortable circumstances.

To many here present, I am sure that such a proposition appears as a Utopian socialistic dream, but I am convinced that if I live to a moderately old age I shall see some such scheme in operation. When health insurance comes to be seriously talked of in Maryland, I hope that it will be faced as a state-wide proposition, and that this faculty will do its part toward drafting satisfactory legislation, and if the law provides that the plan shall be put into effect and administered by a commission, that we shall see that it is stipulated that at least one third of its membership shall be physicians elected by this body, very much as the members of the State Board of Medical Examiners are chosen. If some such arrangement is not made, and the administration of the law is entrusted entirely to laymen, I can foresee years of just such trouble as Germany is now recovering from There is one other point which I regard as fundamental, and that is that in this country no plan will be acceptable which does not guarantee to the insured a reasonably free hand in the choice of the attending physician

Such dreams may seem far removed from the solution of the problems of dispensary and hospital abuse, but until they are fulfilled, I see no prospect of checking it, but on the other hand, every probability that it will expand as the dispensaries and hospitals become more efficient and the practice of medicine more complicated

One word more and I have done The remedies here suggested will care for the industrial worker, the school teacher and the small clerk, while the well-to-do can take care of themselves But what about the person in moderate circumstances, who wants to pay for what he gets, but at present finds it difficult to do so? For his ordinary illnesses he can continue to employ the present type of practitioner, for his troubles do not commence until diagnostic difficulties occur, or a surgical operation or prolonged stay in a hospital becomes necessary

I believe that the final solution of this aspect of the problem will ultimately be found in the development of a new type of hospital, in which the substitution of cubicles for the expensive private room will make a moderate charge possible In such institutions a mechanism should be developed by which the fees for professional services will be automatically regulated in accordance with the patient's financial standing If this were combined with a cooperative diagnostic institute with moderate inclusive fees, sickness would lose the additional terror of financial pressure which of late years has been imposed upon it

THE DUODENAL TUBE AS A FACTOR IN THE DIAGNOSIS AND TREATMENT OF GALLBLADDER DISEASE *

MAX EINHORN, M D
Professor of Medicine at the New York Post Graduate Medical School
NEW YORK

As a rule, we can say that the nearer we get to an organ and the fluids within it, the better we can deal with it diagnostically and therapeutically The duodenal tube has brought us to Vater's papilla It enables us to obtain the secretions from this important source in a direct manner It also allows us to instil fluids in its immediate vicinity and thus exert a beneficial influence on the tissues in its neighborhood

About two years ago[1] I discussed the subject of the direct examination of the bile as an aid in diagnosis In the present paper I intend to give my further experiences regarding this point in gallbladder diseases, and then speak on the treatment of these affections by means of the duodenal tube

Since May, 1914, I have diagnosed probable cholecystitis by the direct examination of the bile in conjunction with the usual symptoms in forty cases Thirteen patients with cholecystitis and allied diseases, whose bile was directly examined, were operated on Outlined reports of the latter cases are given in the accompanying table

Of the thirteen patients operated on, eight had stones in the biliary apparatus, one of the latter showed clear bile, while the other seven presented a turbid state of the duodenal fluid Five of the patients operated on, with turbid bile, had no stones two of these had malignant tumors, one of the liver, the other of the stomach and pancreas One had tuberculous peritonitis and adhesions over the gallbladder, one chronic appendicitis, and one hour-glass contraction of the duodenum below Vater's papilla

In the majority of cases in which turbid bile is found in the duodenum in the fasting condition, cholecystitis with gallstones is encountered Turbid bile may, however, exist without gallbladder disease, when the liver itself is seriously diseased (neoplasms or echinococcus of the liver or high grade cirrhosis) or in stricture of the duodenum below the papilla of Vater

On the other hand, clear bile may exceptionally be found in association with biliary calculi There are two possibilities Either the gallbladder is not inflamed, notwithstanding the presence of the stones, or the gallbladder is entirely filled with the calculi In this case no bile enters the organ, and it therefore appears in the duodenum in the same state as excreted by the liver, without any admixture of the gallbladder secretions Such occurrences, however, are rare

In any event, the macroscopic appearance of the bile is of great import in the diagnosis of gallbladder disease or grave diseases of the liver A clear golden yellow bile speaks well for the functions of these two organs, while a turbid, greenish or dark brown looking bile, perhaps mixed with mucus, speaks for a diseased state of either the gallbladder or liver or both Again, in gallbladder affections the bile is liable to change in character, for its turbidity, when present, is then due to an admixture given it during its sojourn in the vesicula fellis In permanent affections of the liver we can expect a stationary appearance of the bile, as its character is given it at the place of production

The diagnosis of cholecystitis or cholelithiasis cannot be made from the appearance of the bile alone The latter, however, in conjunction with the other clinical signs, will be of great assistance in establishing a correct diagnosis

As the duodenal contents change very quickly in appearance, it is essential to examine them immediately after withdrawal In order to preserve a specimen for demonstration or later consideration, an artificial reproduction of the sample by means of anilin dyes can be made I use for this purpose these stock solutions (1) yellow (MXX), (2) red (eosin), (3) naphthol green anilin, (4) nigrosin black, (5) methyl blue, and (6) French chalk and water

A small vial is filled two thirds with clear water, and as much of the yellow to correspond with the sample to be represented is added Thereupon is added whatever mixture is needed red to represent a brownish tint, green to effect greenish discoloration, and French chalk to imitate turbidity After a little practice the imitated samples will resemble more closely the real contents These artificial samples can be kept indefinitely without change, and will bring back to memory the exact appearance of the original fluid, immediately after its withdrawal from the duodenum

---

* Read before the American Gastro Enterological Association, Washington, D C, Ma[illegible] 8, 1916

[1] Einhorn, Ma[illegible] Direct Examination of the Duodenal Contents as an Aid in the Dia[illegible]osis of Gall Bladder and Pancreatic Affections, Am Jour Med Sc, Octo[illegible] 1914, p 490

We now come to the use of the duodenal tube in the treatment of gallbladder lesions In a number of patients with cholecystitis an attempt was made to instil either a weak solution of ichthyol or argyrol into the duodenum just above Vater's ampulla This I did first in catarrhal jaundice, later also in other minor affections of the gallbladder, not requiring surgical aid The plan of this mode of treatment is based on the idea that an astringent effect on the duodenum and the papilla of Vater will exert a beneficial effect on the bile duct The clinical experience seems to favor this view

The mode of treatment is carried out in the following way The patient is given the duodenal tube either

CASES IN WHICH THE DUODENAL CONTENTS WERE EXAMINED PREVIOUS TO OPERATIVE INTERVENTION

Case	Name	Diagnosis	Examination of Duodenal Contents				Appearance of Duodenal Contents	Microscopic Examination of Duodenal Contents	Remarks
			Date	Amylopsin mm	Steapsin mm	Trypsin mm			
1	Mrs L	Icterus due to obstruction of common duct cholelithiasis	9/21/13	8	Trace	0	Slightly reddish no bile		At operation stone found in the common duct
			9/22/13	0	5	Trace			
2	Mr H D	Cholelithiasis	4/27/14	15	1	2	Yellowish turbid		Gallstones found at operation
3	Mr H. Jr	Cholelithiasis	11/27/14	6	15	20	Turbid milky yellow alkaline		Operated on 1/14/15 gallstones found
			1/12/15	8	2	1	Yellow green turbid alkalinity = 10		
4	Mr H E	Ulcus ventriculi and cholecystitis	11/25/14	4	25	3	Golden yellow clear alkaline		Operation gallstones found also ulcer of the stomach
			12/7/14	5	15	5	Golden yellow clear Alkalinity = 40		
			12/10/14	4	1	0.5	Yellow alkaline alkalinity = 15		
5	Mr L.	Cholelithiasis icterus gallbladder filled with stones and palpable	11/10/14	10	0	1	Watery turbid alkalinity = 55		Operation stones removed
			11/14/14	4	0	1	Greenish yellow		
			11/16/14	10	4	1.5	Yellow turbid neutral		
6	Mrs P	Icterus obstructive jaundice chronic pancreatitis	1/4/16	0	6	0	Clear watery	Few bile stained epithelial cells	Operation big stone found in the hepatic duct
		Postoperative biliary fistula	1/11/16	0	0	0	Turbid dark blackish green alkalinity = 10		
7	Mr M.	Cholecystitis	1/22/16	2	0	6	Yellow slightly turbid alkaline		Operation tuberculous peritonitis
			1/25/16	0	0	0	Whitish no bile neutral		
8	Miss G	Cholelithiasis pancreatitis	3/28/16	0	2	1	Dark greenish yellow turbid alkalinity = 10	Swarming with micrococci and bacilli	Operation enlarged gallbladder 2 large stones head of pancreas indurated
		Postoperative biliary fistula	4/17/16	0	2	0	Dark golden yellow alkalinity = 85		
9	Mr K.	Cholecystitis	3/14/16	8	6	6	Yellow tinged with green turbid alkalinity = 10	Few cholesterin crystals bilirubin crystals leucin crystal epithelial cells	Operation tumor of left lobe of the liver
10	Mr D	Neoplasma ventriculi et pancreatis	9/11/13	5	3	4	Brownish green alkalinity = 40		Operation tumor of stomach encroaching on the pancreas
			9/15/13	8	3	2	Brownish turbid alkaline		
11	Mr C	Cholecystitis chronic appendicitis X ray diagnosis defect in pyloric region probably cancer	4/16/15	7	2	5	Yellow turbid alkalinity = 75		Digestive test capsule after 29 hours potato catgut fat trace present thymus and nuclei partly present Operation 4/23/15 negative appendix removed
12	Mr T	Cholecystitis..	3/28/16	4	0.5	1	Greenish yellow cloudy alkalinity = 45	Filled with micrococci and bacilli	Operation 4/21/16 hour glass contraction of duodenum below Vater's papilla
			3/30/16	10	2	4	Dark green (methyl blue) alkalinity = 0	Cercomonas hominis present	
			4/19/16	6	4	5	Dark brown tinged with yellow green Alkalinity = 50 rennet +	Numerous bilirubin calcium crystals cholesterin crystals of irregular shape few bacteria epithelial cells	
13	Mrs K.		4/29/16	5	1	0	Light yellow not turbid alkalinity = 20		Operation 5/5/16 gallbladder enlarged sausage like containing about 150 c c 2 stones found in gallbladder and cystic duct
			5/4/16	4	3	3	Yellow tinge of green turbid alkalinity = 20		

at night before retiring, or about 5 a m He takes it with a glassful of water About 8 or 9 a m the patient is then examined in the fasting condition, and the position of the capsule end of the tube ascertained If found in the duodenum, the tube is slightly withdrawn (about 1 inch), so that Mark III is outside of the lips The barrel of the syringe is now filled with a 0 25 per cent argyrol solution (blood temperature), and the latter instilled into the duodenum by raising it As soon as the contents disappear, the barrel is refilled with the same solution, and now the tube is pulled out about 1 or 2 inches more and the instillation repeated From 20 to 30 c c of this solution may be thus injected Ichthyol may be given in the same manner I have used this mode of treatment every other day in a number of cases with benefit

Among the many cases of duodenal alimentation carried out, mainly for the relief of gastric or duodenal ulcer, there were quite a number of patients (twenty) who had gallstones at the same time (This diagnosis was made by the clinical history and symptomatology, in some by positive Roentgen findings, and in some by the passage of calculi) The latter were benefited not only with regard to their digestive disorders but also in reference to their gallbladder condition This occurred in a striking manner in such frequency that I feel inclined to attribute to the duodenal alimentation a decidedly beneficial influence also on the gallbladder lesion

This might be explained by the partial rest afforded the liver in keeping the portal supply at low ebb The improved condition of the liver, in turn, acts beneficially on its appended organ, the gallbladder

The duodenal alimentation will, therefore, find an appropriate place in some forms of cholecystitis, particularly when complicated with ulcers of the stomach or duodenum

---

ACIDOSIS IN DIABETES *

R T WOODYATT, M D

CHICAGO

THE ABSENCE OF A SHARP LINE OF DIVISION BETWEEN DIABETIC AND NONDIABETIC STATES

As a basis for the discussion of acidosis occurring in diabetes, I will first develop certain views regarding the points of difference between a diabetic and a nondiabetic individual and then return to the subject proper

In the normal individual there exists a proportionality between the rate at which glucose is utilized or stored, and the rate at which it is excreted unchanged in the urine This proportionality differs with different rates of glucose supply to the cells When the rate at which glucose is brought into the tissues from both external and metabolic sources is below a certain minimum (expressed in terms of the weight of glucose per unit weight of tissue and unit of time), nearly all the glucose is utilized or stored, and only a trace escapes in the urine unchanged When the rate of glucose supply to the cells (from both external and internal sources) is above this minimum, then the percentage of wastage increases rapidly, and when the rate of supply rises above some 3 5 gm per kilogram per hour, as it can be made to do by intravenous administration, then, in a normal, well-nourished individual, from 35 to 50 per cent may be excreted[1] Under these conditions a normal individual is, as it were, from 35 to 50 per cent diabetic, and he has the intense glycosuria, polyuria and thirst found in a genuine case of diabetes with a lower rate of glucose supply

In cases of so-called "total" human diabetes there also exists a proportionality between the rate at which glucose is stored or utilized, and the rate at which it escapes in the urine, as in health, this proportionality varies with the rate of glucose supply to the cells (the grade of the diabetes and other factors remaining the same) If the rate of supply is below a certain minimum, then, as in health, most of the glucose supplied is stored or utilized, and only a trace appears in the urine

The so-called "total" diabetic differs from the normal person only in the fact that this minimum is absolutely lower than in health In order to reduce the rate of glucose supply to the cells below the minimum necessary to make a case of so-called "total" diabetes free from glycosuria, it is necessary to stop entirely all intake of sugar and sugar-forming elements in the form of food, and also to cut down the rate of endogenous glucose formation This means fasting and rest with the exclusion of cold and every other influence which may stimulate metabolism Fasting, rest and warmth, however, do not wholly stop the endogenous formation of glucose They only decrease it As Lusk has pointed out, during a fast, glycogen reaccumulates in dogs which have previously been deglycogenized by the use of phlorizin plus cold or epinephrin, a fact which we have several times confirmed In these cases the glycogen comes, for the most part, from the protein metabolism which persists during fasting Yet uncomplicated cases of "total" human diabetes become nonglycosuric during a fast in spite of this endogenous glucose supply

Cases of severe diabetes rendered nonglycosuric by fasting, rest and warmth lose all the ordinary symptoms of diabetes, even the respiratory quotient rising to a degree which suggests some glucose utilization This latter effect has been shown by Benedict and Joslin and by Du Bois

It is accordingly clear that the state of every normal individual becomes diabetic when the rate of glucose supply to the cells is high enough, and every case of human diabetes passes into the nondiabetic state when it is possible to make the rate of glucose supply to the cells low enough The difference between a "total" diabetic, so called, and a healthy person is purely relative

ACIDOSIS IN GENERAL

Returning now to the subject of acidosis, I would emphasize the point that acidosis in diabetes occurs under the same fundamental conditions and conforms to the same general laws which pertain to acidosis in nondiabetic individuals That particular type of acidosis which is so commonly seen in the severer cases of diabetes, the type characterized by the appearance in the blood and urine of beta-ketobutyric and beta-hydroxybutyric acids and acetone, might appear to have laws of its own and to differ specifically from the same type of acidosis when seen in nondiabetics during the course of simple fasting or one-sided diets

---

* Read before the Association of American Physicians, Washington, D C, May 8, 1916

[1] These statements are based on studies with sustained intravenous injections of sugars carried out by Sansum, Wilder and Woodyatt, 1915 and 1916 These studies are in part unpublished

The writings of certain authors would encourage this idea, but the difference is only a matter of degree

Our knowledge of diabetic acidosis began with Hallervorden's discovery of increased quantities of ammonia in the urine in cases of severer diabetes Previous experimental studies by Hallervorden and Coranda having demonstrated that an increase of urinary ammonia was commonly associated with an increased excretion of acid radicals, it was suspected that this might be the case in diabetes Following the idea that the increase of urinary ammonia might signify an increased excretion of the ammonium salts of unknown acids, Stadelman and Hallervorden proved that large quantities of alpha-crotonic acid could be distilled from acidified diabetic urine, this acid arising from the decomposition of beta-hydroxybutyric acid, as was later shown by Külz and Minkowski It was to this condition that the term 'acidosis" was first applied, and, in this paper, for the sake of convenience, the term will be used in this original sense, although it is clearly recognized that an increased production and excretion of acid radicals partly combined in the form of ammonium salts is not inevitably associated with an increased hydrogen ion concentration in the blood or with a depletion of the blood bicarbonate, because, if the body is adequately supplied with suitable bases during the course of the acidogenic process, the latter phenomena need not develop

ORIGIN OF THE ACIDOSIS COMPOUND

It is at present common knowledge that beta-hydroxybutyric acid and its two congeners, beta-ketobutyric acid and acetone (known collectively as the "acidosis compounds" or "acidosis bodies" in accordance with Naunyn's suggestion, and less aptly as the "acetone bodies," after Geelmuyden), arise from products formed in the catabolism of fats and proteins and more specifically from certain of the lower fatty acids containing an even number of carbon atoms, in particular, perhaps, butyric acid The chemistry of the formation of these lower fatty acids from the higher fatty acids and from certain of the amino acids, as well as the mechanism by which the lower fatty acids are converted into the acidosis compounds, cannot be discussed here

CONDITIONS FAVORING THEIR APPEARANCE

It has long been known that one fundamental prerequisite for the accumulation in the tissues and subsequent excretion of abnormally great quantities of the acidosis compounds is a relative diminution in the rate of carbohydrate utilization When, for any reason whatsoever, the rate at which glucose is utilized in the body falls below a certain minimum, relative to the rate of the fat and protein catabolisms, then the acidosis compounds appear in the blood and urine It is worthy of emphasis that, when we speak of a decreased rate of carbohydrate utilization in this connection, we should have in mind specifically the catabolism of *glucose* and think, not merely of an *absolutely* decreased rate of glucose catabolism, but of a diminution *relative* to the existing rate of lower fatty acid (for example, butyric acid) oxidation

In 1914 Zeller[2] fed patients isocaloric, nonprotein diets He varied the proportions of fat and carbohydrate and first noted an increased output of ammonia when the proportion of carbohydrate was less than 1 part by weight to 4 parts by weight of fat He reckoned that for the complete utilization of two molecules of the fat which he employed, at least one molecule of glucose must oxidize at the same time Lusk suggests rereckoning these results somewhat as follows Two molecules of fat can yield by saponification six molecules of fatty acid and two of glycerol The two molecules of glycerol can yield in the body one molecule of glucose Adding this to the glucose derived from the diet directly, it would appear, if we accept Zeller's results (and leave out of consideration for the moment the protein metabolism), that six molecules of higher fatty acid required for their complete oxidation the simultaneous utilization of at least two molecules of glucose One might accordingly say *When the mixture of metabolites oxidizing in the body contains more than three molecules of higher fatty acid to one of glucose, then the body "smokes" with acidosis compounds like an automobile with too much oil in the cylinders* It follows that some equally definite but not identical, relationship exists between the number of glucose molecules necessary for the complete utilization of a given number of molecules of a lower fatty acid, such as butyric acid

ACIDOSIS IN FASTING

During a period of fasting the cells naturally continue to oxidize foods Before the fasting begins, the proportions of fat and carbohydrate catabolized are determined roughly by the proportions of fat and carbohydrate in the diet supplied from the outside world After fasting begins, the proportions of fat and carbohydrate catabolized must be fixed by the proportions in which these stuffs are supplied from the tissues themselves The cells will be fed with what there is, and the proportions in which they catabolize carbohydrate and fat during starvation must therefore depend in the end on the proportions in which these stuffs have been stored R M Lang[3] has confirmed these principles by direct experimental studies

It is accordingly clear how, with respect to acidosis, fasting may produce a variety of effects in different individuals depending on how their bodies may assay for fat and glycogen at the time fasting begins, and this must depend to a large extent on the previous diet

A person in whom there is no appreciable fat and only a trace of glycogen will necessarily during a fast subsist wholly on body protein It is very doubtful whether this is productive of any acidosis of the type we are discussing, because from 45 to 58 per cent of the protein is capable of conversion into glucose, and of the remaining 55 to 42 per cent , only a fraction consists of ketogenic amino acids, that is, of amino acids capable of yielding acidosis compounds Unless something interferes with the oxidation of the glucose derivable from protein, this glucose probably suffices for the complete oxidation of the ketogenic fraction of protein This also would seem to be verified by the experiments of Lang On the other hand, if the body at the beginning of a fast contains a considerable glycogen reserve and also a normal amount of fat, we would expect at first no significant acidosis because there would be at first enough glycogen for the proper burning of the fat But later, since the glycogen reserves tend to run low sooner than the fat reserves, we might expect an increasing preponderance of fat in the metabolism, and hence a rising acidosis

---

[2] Zeller Arch f Physiol. 1914 p 213

[3] Lang R M. Biochem Jour 1915 ix 456

If the fasting were pushed until the fat reserves were also depleted, one might again anticipate a decline of the acidosis as the metabolism returned to an almost purely protein basis. Again, if the body at the beginning of a fast contained an excess of fat *in proportion to the glycogen*, a quicker and higher acidosis during starvation than in a strictly normal person would not seem strange. Perhaps the sudden and sharp fasting acidosis observed by Folin in the obese is due simply to the fact that these persons, thrown back on a diet consisting of their own tissue materials, find them excessively fatty. But of course it is conceivable that two bodies containing the same amount of fat might during a fast use it with different degrees of rapidity.

ACIDOSIS IN DIABETES

Acidosis develops in diabetics under exactly the same fundamental conditions which cause acidosis in nondiabetics. In diabetes however, owing to pancreatic insufficiency, the *maximum rate* at which glucose can be oxidized in the body is fixed at some level which is absolutely lower than in health. The limited amount of glucose which the diabetic can oxidize per kilogram of body weight per unit of time fixes the amount of fat which he can oxidize (without developing acidosis) during the same time. He can burn only about four times as much fat as carbohydrate without developing acidosis. It therefore happens that in the severer cases of diabetes a rate of fatty acid metabolism, which in the absolute sense is not greater than what might occur in health, becomes excessive in proportion to the amount of oxidizing glucose, and so acidosis develops.

In order to check a diabetic acidosis, it is necessary to restore the proper ratio of fatty acid to glucose oxidation by reducing the fatty acid metabolism to whatever level is fixed by the existing rate at which glucose is oxidizing. In diabetes, protein alone, if metabolized in sufficient amounts, may be productive of acidosis as well as fat, because, although protein in breaking down liberates plenty of glucose for the complete oxidation of its own ketogenic fraction, in diabetes not all of the glucose so formed can be oxidized, owing to the lessened ability of the body to *split it open*. *Accordingly, to check a diabetic acidosis* it is necessary to reduce both the protein and the fat metabolism. Fasting, rest and warmth accomplish this, and it is easy to understand how this procedure might cause a reduction of acidosis in many cases of diabetes, just as the same treatment causes a cessation of glycosuria. The fact that it *commonly* does so is well verified by the recent studies of Allen, Stillman and Van Slyke.

It would not be expected, however, that in diabetics, any more than in nondiabetics, fasting would always have exactly the same effect on acidosis. We should always have to consider what the previous diet of the diabetic had been and how his body would assay for fat and glycogen at the beginning of the fast, not merely the amount of glycogen (as stated by Allen in a recent quotation from the work of Landergren and Forsner), but the relative quantities of both glycogen and fat.

If the diabetic patient were emaciated and his body contained little fat, fasting would be equivalent to throwing him on almost purely protein metabolism, and unless some toxic factor maintained too high a rate of protein metabolism in spite of the fasting, we should not expect a *fasting acidosis*. For probably protein alone does not cause acidosis if all the glucose derived from it is oxidized, and when the absolute rate of protein metabolism sinks low enough, even the severest cases of diabetes can oxidize all the glucose that is formed from protein. This follows from what was said at the beginning of the paper. In a case recently studied by Geyelin and Du Bois, fasting caused a marked diminution of the acidosis even while the protein metabolism was relatively high and the G:N ratio in the urine was still 3.65:1. The fasting in this instance doubtless served to cut down the great preponderance of fatty acids in the metabolic mixture, leaving the patient more nearly on a purely protein metabolism. This case, as Geyelin and Du Bois remarked, gave evidences of a toxic (*infectious*) factor which served to keep up a relatively high rate of protein metabolism in spite of fasting. Hence the persistent glycosuria with some acidosis.

I have not been able to share the view expressed by some, that the lessening of diabetic acidosis during starvation is in any sense paradoxical, or to see the truth of generalities to the effect that fasting lowers acidosis in diabetics while in nondiabetics it causes acidosis. Our own experience is that diabetics have acidosis about as soon and in about the same degrees as nondiabetics *when there is reason to think that they are metabolizing similar mixtures of foodstuffs during the fasting*.

Fasting will lower acidosis either in health or in diabetes *if it has the effect of stopping a one-sided metabolism and throwing the tissues on a more nearly balanced ration of fatty acids and glucose*. To be sure, diabetics far and wide are much more likely to have lost a considerable part of the body fat, and so in fasting they are more frequently thrown back on an almost purely protein metabolism of low absolute magnitude. This is not a condition productive of acidosis. *But normal persons in comparable states of nutrition behave in exactly the same manner*. And if diabetics are very fat it may happen that fasting results in a persistence, yes even in a sharp increase of acidosis, as it does with the nondiabetic obese. In this connection it should be recalled that in every case of severe diabetes, if the patient receives any diet whatsoever, he promptly loses most of that which is already carbohydrate or which can be converted into carbohydrate in the body, and the tissues are left on what is tantamount to a purely fat diet. Fasting in the case of severe diabetes, therefore, is in effect comparable to the discontinuance in health of a heavy diet consisting wholly of fat.

In perfectly normal persons it is not possible, by the use of ordinary foods and methods of feeding, to cause excretions of acetone beta-ketobutyric and beta-hydroxybutyric acids in such amounts as may occur with similar diets in the severest forms of diabetes, even if the nondiabetics receive forced feedings consisting wholly of fat. This is due primarily to the fact that in normal persons, even on such diets, the rate of oxidation of glucose derived from body protein and from glycerol is considerable and suffices for the complete oxidation of some of the fatty acid, and secondarily, to the fact that there is a limit to the height to which the fat metabolism can be driven by fat feeding, a limit fixed by the limited rate at which fat can be absorbed from the bowel, no matter how much may be fed. Wherefore, it is impossible by fat feeding in health to create so *wide* a discrepancy between the fatty acid and the glucose oxidation rates as that which can occur in diabetes Nevertheless, the fat-fed person may develop a far greater surplus of fatty acids in the metabolic mixture while on a wholly fat diet than the same person will have during a fast, particularly if he happens to be a lean subject Moreover, if the fat-fed person fasts, the acidosis diminishes or wholly disappears This phenomenon is the equivalent of the cessation of acidosis during a fast in diabetes

Similar comments might be made concerning the increase of the respiratory quotient As fasting in diabetes frequently leads to a lessening or disappearance of acidosis, by cutting down the amounts of fatty acids in the metabolic mixture until even such little glucose as still smolders in the cells suffices for their complete combustion, so fasting in diabetes might be expected, under the same conditions, to cause at least *some increase of the respiratory quotient* While the patient is being fed and the metabolism is running high with a very great preponderance of fatty acids undergoing oxidation, the absolute quantity of glucose oxidizing is too small to be recognized in the respiratory quotient by existing methods, but usually as the total metabolism drops and drops chiefly by virtue of an absolute and relative lessening of the fatty acids, the percentage of glucose in the mixture rises correspondingly Althought the total metabolism is now low, the percentage of carbohydrate entering into it is increased, and there must be some increase of the respiratory quotient for this reason alone

Occasionally we have encountered diabetic persons in whom the acidosis has shown anomalous variations difficult to explain in terms of the proportions of glucose and fatty acids undergoing simultaneous oxidation in the body as a whole How are these variations to be interpreted? Dr Howland has spoken of acidosis occurring in infants without diabetes and in spite of balanced diets Analogous phenomena may be seen in certain types of infection in adults, notably in the so-called "milk sickness" studied by Jordan and Harris, and in some streptococcus infections, especially it seems to me in migrainic or hepatargic cases In such instances there need be no disproportion of glucose in the diet, the acidosis may antedate the abstinence from food, and there is no proof of a disability on the part of the body as a whole to utilize glucose

It is here interesting to consider the question of where in the body acetone, beta-ketobutyric and beta-hydroxybutyric acids are chiefly formed, and where under ordinary conditions glucose exerts its normal antiketogenic effect There are ample experimental reasons for assuming that the greater proportions of all the acetone bodies formed in the body are created in the liver and muscle cells The liver especially, if we may judge from perfusion experiments, seems to constitute the largest acetone factory and the principal site of the normal interaction between oxidizing fatty acids and oxidizing glucose In such cases of acidosis we might therefore think of infections or of inherited abnormalities, or of both together, affecting particularly the liver cells and so preventing locally that reaction between oxidizing glucose and fatty acids which normally inhibits any considerable accumulation of the acidosis compounds How such an interference might be effected is a question which would involve a detailed discussion of the nature and the mechanism of the phenomena known as "antiketogenesis" This time prohibits

Whatever the mechanism in these cases may be, it can be assumed with safety that no person, merely because of an accident to the pancreas of such a nature that symptoms develop which justify a diagnosis of diabetes, will by virtue of this accident become immune to infections There is accordingly reason to expect that occasionally a person who happens to have a subnormal endocrine function of the pancreas may also develop an infection of the kind mentioned, and that this may start an acidosis, or, if an acidosis is present already, augment it

It would seem desirable in all discussions of acidosis in diabetes to make a clear distinction between true diabetogenous acidoses and nondiabetogenous acidoses occurring by accident in diabetic individuals

LARGE ENDOTHELIOMA OF THE DURA COMPRESSING BOTH FRONTAL LOBES *

MOSES KESCHNER, M D
Adjunct Attending Neurologist to the Montefiore Home and Hospital
Assistant Neurologist to the Central Neurological Hospital
Visiting Physician City Prison Brooklyn
NEW YORK

Neurologic literature is rich in reports of cases of tumors of one frontal lobe, but reports of involvement of both frontal lobes are rare

CASE REPORT

F P, woman, colored, aged 30, a domestic, admitted to Dr Abrahamson's service of the Central Neurological Hospital, June 23, 1915, complained of severe frontal headache, blindness, difficulty in walking, weakness and incontinence The family history and antecedent personal history were unimportant. Her habits were good She was well up to five months previous to admission, when she began to have frontal headaches and pains in the eyeballs These pains were constant and became progressively worse Her vision at first was dim, and two months before entrance she became totally blind. At this time she began to vomit her food her memory began to fail, locomotion became awkward, and just prior to admission she became incontinent All these facts were obtained from the patient.

The patient was found on examination to be well developed and moderately well nourished She was totally blind, and the head was bent forward hanging loosely and at times swaying to and fro in an anteroposterior direction, that is nodding The temperature was 98, the pulse rate 68 with the patient standing, 60 when sitting, and the pulse was small in volume and regular The respiration was 16 per minute and regular The systolic blood pressure was 120 diastolic 85 The tongue was moist and coated and had a fine, regular tremor The hands were dry The heart, lungs, abdomen and pelvis were negative. The skull was normal

Innervation was equally poor on both sides, and was also poor on the forehead Deglutition mastication and articulation were normal The voice was nasal, and the speech whining in character The expression of the eye was vacant, and the eyeballs were protruding and tender, both equally so Von Graefe s sign was present, and also slight nystagmoid movements in the vertical direction No strabismus and no ptosis were found The pupils were widely dilated and unequal the left smaller than the right, and there was no reaction to light or to accommodation a case of total amauros s The ophthalmologist reported bilateral postneuritic atrophy

---

* Read before the New York Academy of Medicine Section on Neurology and Psychiatry April 11 1916

Hearing was normal There was no hydrorrhea, but there was total bilateral anosmia The patient could not distinguish by taste between sugar, salt and vinegar, but she said strychnin was bitter, and spit it out

The muscles of the upper extremities were flabby, with a tendency to hypotonicity The muscles of the lower extremities were well developed with a tendency to hypotonicity The hips, knees and ankles were spastic both during active and passive movements The gait was of the spastic ataxic type, the patient reeling as if drunk, but not always in the same direction She walks with a broad base, very unsteady, and is not certain when the foot has reached the floor That this uncertainty is not due altogether to her blindness is proved by the fact that she has the same difficulty in moving her legs when lying in bed, in spite of the fact that her postural sense is good

Romberg's sign is markedly prominent The plantar and knee reflexes are exaggerated and the gluteal reflexes are present

Kernig (resistance to extension of leg or flexed thigh) and Bechterew's signs, Babinski, Oppenheim and Gordon's reflexes are absent Abdominal reflexes present The ankle reflexes were present and exaggerated There was no ankle clonus and no sensory disturbances could be elicited The mental condition of the patient should be borne in mind There was no motor aphasia, no astereognosis (failure of tactile perception), no adiadokocinesis (failure to alternately extend and flex joints quickly and repeatedly, particularly supination and pronation)

Cerebration was slow, cohesion of ideas poor, and there was emotional instability The patient answered questions slowly, became irritated when asked to repeat an answer, and cried and laughed without sufficient cause When reproached by the examiner for her lack of cooperation, she answered "I am doing the best I can" She was poorly oriented as to time, place and person Her memory was so poor that she did not remember her present address, her husband's or her child's name When asked to mention her birth place, she answered "I can't keep so many things in my mind" When asked to give the names and addresses of two nearest friends or relatives, she answered "When you are sick you have no friends"

The sleep of the patient was restless, with moaning She was drowsy by day and dizzy

A Wassermann test was negative The cerebrospinal fluid was under considerable pressure, but negative both as to the Wassermann reaction and cytologically

The patient was admitted June 23, 1915, at 3 p m, and lumbar puncture was performed on the same day at 5 p m During the remainder of that day she appeared to be in a dazed condition, but took nourishment fairly well On June 25 she got up, after having spent a very restless night, complaining bitterly of severe frontal headache and at 10 a m she asked to be put to bed, as she felt very weak She ate her dinner, and died suddenly at 2 20 p m, without having had any general or localized convulsion at any time

From the examination and history it was evident that we had to deal with some intracranial condition, probably a rapidly growing neoplasm, most probably nonsyphilitic in nature, quite extensive in size and bilateral in character The exact location of this neoplasm, owing to the fact that intracranial growths give a variety of distant (remote) symptoms that sometimes overshadow the direct symptoms, was not a very easy matter to determine

To exclude the middle cranial fossa was comparatively easy It was not so easy, however, to exclude the posterior one Growths in this fossa usually give severe pains in the nape of the neck, yet pains in the front of the head are just as common The position of the pain, therefore, could not be used as a localizing symptom The symptoms of cerebellar tumors are so allied to those of frontal tumors that errors are not always avoidable

Oppenheim found repeatedly unilateral or bilateral anosmia in cerebellar tumors, a condition due to flattening of the olfactory nerves by pressure exerted on them by the base of the brain

One must bear in mind the relative value of early and of late symptoms of brain tumors The vast majority of late symptoms have little focalizing value The distortion of the brain and the marked internal hydrocephalus, occurring in the later stages of tumor, produce a variety of symptoms due only to the distortion and internal hydrocephalus, and not due to the position of the tumor Late symptoms, however, occurring according to anatomic contiguity, may have considerable value Stewart and Holmes long ago called attention to the fallibility of diagnosis depending on late symptoms in tumor of the brain Anosmia, squint, particularly of the external rectus muscle, tinnitus, convulsions, general or jacksonian, are late symptoms of importance in tumors of the cerebellum, but have no definite focal significance

The symptoms of corpus callosum tumors are bilaterality, apraxia or dyspraxia The symptomatology depends on whether the anterior, middle or posterior portion is involved Involvement of the anterior portion gives rise to leg, the middle to arm, and posterior portion to face symptoms Corpus callosum tumors are also characterized by their long duration without choking of the disk, by the frequency of growth in the longitudinal sulcus, and by their extension to and even through the vault of the cranium These tumors also give rise to jacksonian fits, which are usually bilateral, a peculiar mental state, with apathy, and the lack of harmonious interaction of both halves of the body

Liepman has shown that a lesion situated in the right frontal lobe may cut across the path of fibers passing from the left frontal lobe, via the corpus callosum to the right arm center in the right hemisphere, without injuring the projecting fibers from that arm center to the left hand, so that we would have a left dyspraxia from a right frontal lobe lesion

When tumors grow from the meninges or bone (extramedullary tumors) toward the brain and do not involve the brain itself, the Babinski phenomenon may be absent, and the abdominal reflexes present on the opposite side This is particularly true if no secondary softening of the brain substance has occurred In intramedullary conditions the reverse is true, except in postcentral tumors which do not involve the pyramidal tracts Our case showed the absence of Babinski, preservation of the abdominals, with no sensory involvement, and thus pointed fairly definitely to an extramedullary growth

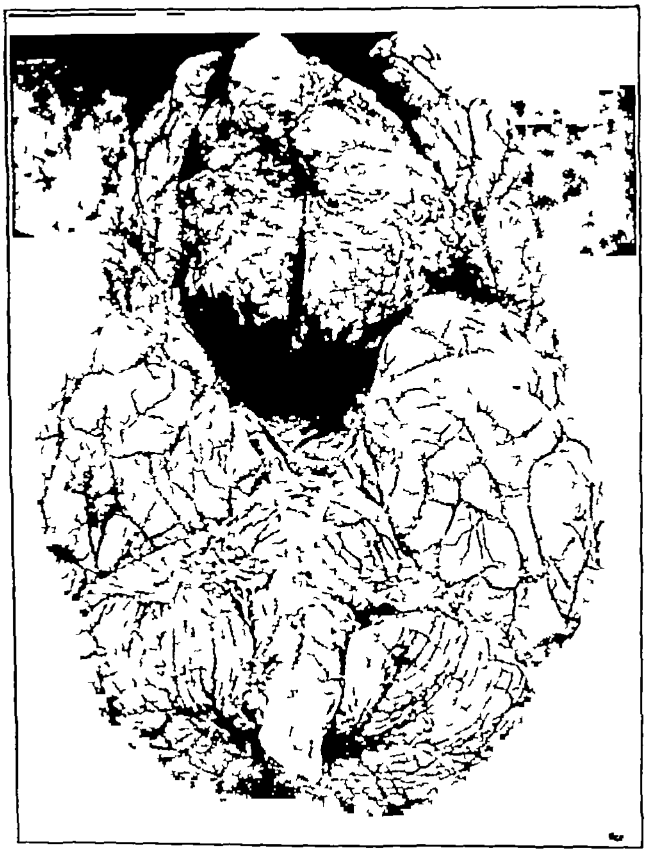
Various attempts have been made to attribute the mental symptoms occurring in brain disease to frontal lobe involvement, but without success It is inconceivable that such matters as the intelligence, emotions, judgment, will or self control should be localized in the frontal part of the brain They are no more localized than the ego itself, nevertheless, it has been established that when the frontal lobes are affected, the mental symptoms are somewhat more in evidence Almost every syndrome of psychic disease has been described by observers as characteristic of frontal lobe disease

When one bears in mind the long duration of these tumors, the large size attained by them, the marked internal hydrocephalus and edema of the brain, so commonly present, and the distortion of the brain, one is not surprised at the appearance of mental symptoms due to the involvement of almost the entire brain But cases are found in the literature in which all the above factors were present, and yet mental symptoms remained in the background

General convulsive movements and focal twitchings have frequently been noted in deep seated frontal tumors Later, when the rolandic area or pyramidal tracts are encroached on, convulsions of jacksonian character occur along with the other convulsions However, it must be borne in mind that jacksonian convulsions occurring late in the course of the disease have often no focal importance

The bilateral ataxic gait could not be explained by frontal involvement, unless one were to suppose that both frontal cortices or subcortices were involved It was best explainable as a variety of apraxia affecting both legs, the location of which is the anterior portion of the corpus callosum

Bearing all these facts in mind, and taking into consideration the fact that in our case exophthalmos was an early symptom, and a postneuritic atrophy has resulted within a period of five months in total blindness, we thought, in the absence of symptoms pointing to cerebellar involvement, that this atrophy was one of the most important localizing symptoms, indicating some increasing direct pressure either on the entire chiasm or on both optic tracts or nerves The important point brought out by Foster Kennedy, that tumors in the frontal region compressing the optic nerve produce a central scotoma on the side of the tumor and a papilledema on the other side, could not be utilized as a diagnostic point, the patient at the time we saw her being totally blind We thought it improbable, if not impossible, that such rapidly onsetting blindness could be a nonfocal symptom, and this, with total bilateral anosmia, and ataxia of the legs, justified a tentative diagnosis of involvement of either both frontal lobes or a neoplasm between them, compressing both the olfactory and optic tracts and nerves The absence of a Babinski and the presence of the abdominals were not at this time easy to explain, but were suggestive of an extramedullary growth



Base of brain showing displacement of medulla and the tumor pushing the thinned out frontal lobes apart Dark line within the tumor is portion from which section was made for microscopic examination

The pathologist's report of the necropsy, which was confined to the head, is as follows

The brain measured 17 by 12 by 9 cm., and with the exception of the tumor mass and the depression at the point of its attachment, appeared normal The weight was not determined

There was a median depression measuring 7 by 6 5 by 5 cm which involved the inferior surface of both frontal lobes The surface was concave and smooth, the convolutions and sulci being obliterated The circle of Willis was enlarged, but complete, the anterior cerebral and anterior communicating arteries in normal position, the former elongated, due to displacement backward of the posterior cerebral, with consequent lengthening of the posterior communicating artery The optic chiasm was displaced backward, being 10 5 cm from the anterior margin of the frontal lobe, the normal distance being from 7½ to 8 cm Lying within this depression was a globular mass 7 by 6 5 by 5 cm, the surface of which was irregularly roughened, showing numerous slight elevations, some of which were circular in outline and others irregular, and which measured from 2 mm to 1 cm in diameter The tumor was attached to the dura mater in the center of the olivary process of the sphenoid for a distance of one fourth of an inch and connected with the brain by a few vascular strands

Microscopically, the tumor cell was elongated and spindle shaped, containing much protoplasm and an egg-shaped or rod-like vesicular nucleus filled with minute chromatin granulations The cells were arranged in irregular, twisting strands or in concentric whorls typical of the endotheliomas of the brain membranes The tumor had a slender, cellular connective tissue framework, which contained an abundant supply of thin-walled blood vessels

The diagnosis was endothelioma

It was unfortunate that the patient's early death deprived us of sufficient opportunity to study the case further, and that no Roentgen-ray examination could be made

After studying the postmortem brain many of the symptoms obscure at first became clear Evidently the peculiar gait and the leg apraxia were due to involvement of the corpus callosum The conclusion that because of the absence of the Babinski sign and the preservation of the abdominal reflex the growth was extramedullary was correct

The specimen further showed that the duration of the disease was much longer than that given by the patient in her history, because it is a well-known fact that frontal tumors may exist a very long time, and that in this situation they may attain a considerable size without giving the slightest focal symptoms

Time for Rest—There should be hours for necessities, not for delights, times to repair our nature with comforting repose and not for us to waste these times—Shakespeare

TRENCH FOOT TETANUS

GEORGE G DAVIS, M D
AND
JOSEPH J HILTON, M D
Surgeons, Twenty Third General Hospital, British Expeditionary Force
ETAPLES, FRANCE

It is the purpose of this paper to report a case of tetanus, occurring as a complication of "trench foot," and to emphasize the importance of an early prophylactic dose of antitetanic serum in this type of case

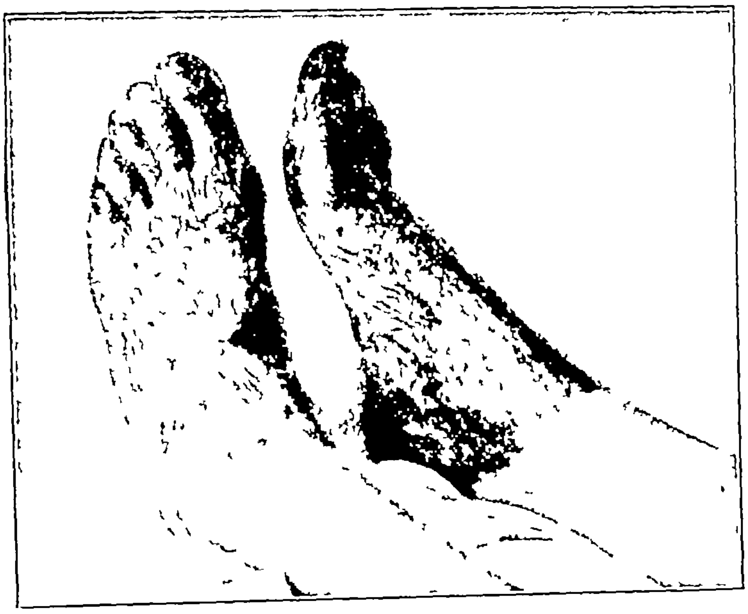

Fig 1 —Superficial abrasions on instep and dorsum of feet and blackening of toes (gangrene) in case of trench foot in which tetanus developed The discoloration of the feet up to the malleoli is due to the application of picric acid Patient died

In using the term "trench foot" we refer to the lesion of the feet which has occurred so frequently in soldiers in the trenches during the cold and rainy weather In the milder cases the feet present no obvious changes, but anesthesia of the functional type is present, or the feet are edematous and definite organic sensory changes can be detected In more severe cases marked cyanosis, gross edema, bleb formation and serious organic sensory changes are present In the worst cases, dry gangrene of the frost-bite type develops, leading to the death of considerable areas of skin, the loss of one or more toes, or massive gangrene of the feet, even extending to the lower third of the leg

The facts of interest in our case are as follows

REPORT OF CASE

Rifleman E C, No 34,946, Company D of the Twelfth Rifle Brigade, aged 20, entered this hospital with the diagnosis of "trench foot," Feb 18, 1916 About February 2 the patient was with his regiment in the trenches near Ypres for five days, during which time he was exposed to the cold and his feet were wet almost constantly, and during the period of five days he changed his socks only twice Then for four days after this he was cut off by the Germans from the rest of his regiment and did not have his shoes off at all during this time He was not wounded and gave no history of injury He remained four days at the casualty clearing station and then was brought here He had no pain in his feet but complained of being unable to go to sleep

On entrance, February 18, the patient had a temperature of 102 4, pulse 120, and respiration 24 per minute The face was rather flushed, and the pupils were equal and reacted equally to light and accommodation Heart and lungs were negative except for the rather rapid rate and a few râles at the base The patient was rather restless, especially at night Both feet were reddened and edematous, which condition extended well up over both ankles, higher on the left leg, where it extended 6 cm above the internal malleolus and 4 cm above the external malleolus The great toe of the right foot was slightly blackened on the dorsal and inner side, and all the toes were more or less cyanotic Anesthesia was present over all the surfaces of both feet, and extended up on both legs about 2 cm Above the anesthetic area was a hyperemic zone, and above this again was a zone of hyperesthesia Over the dorsum of both feet the edema was most marked, and hemorrhagic blebs were present over both insteps Large but superficial fissures were present over the middle of the plantar surfaces of both feet February 22 it was noted that the third, fourth and fifth toes of the right foot, and the great toe of the left foot, became extremely cyanotic, and that insomnia and restlessness continued

February 25, the patient noticed stiffening of the jaw muscles, and 2 000 units of antitetanic serum were given February 26 the jaws were tightly set, and there were slight twitchings of the muscles of the lower extremities The patient caught his tongue between his teeth and slightly injured it There were occasional clonic spasms of the muscles of the back of the neck All toes were now noted to be gangrenous and 10,000 units of antitetanic serum were given intravenously February 27, the respiratory muscles became involved, and opisthotonos became more pronounced, and the spasms more frequent and had to be controlled by chloral and chloroform The patient died, February 28

Immediately after death cultures were made from the tissue from three places in each foot, the gangrenous great toe, the instep where the blebs were, and from fissures on the sole of the foot All six cultures gave the tetanus organism

COMMENT

This patient had not had a prophylactic dose of antitetanic serum It has not been the practice to give it in trench feet cases In all cases in which the patient has been wounded, it is the custom to give a prophylactic dose of 500 units at the front The value of this procedure can be estimated by observation of patients who have passed through this hospital

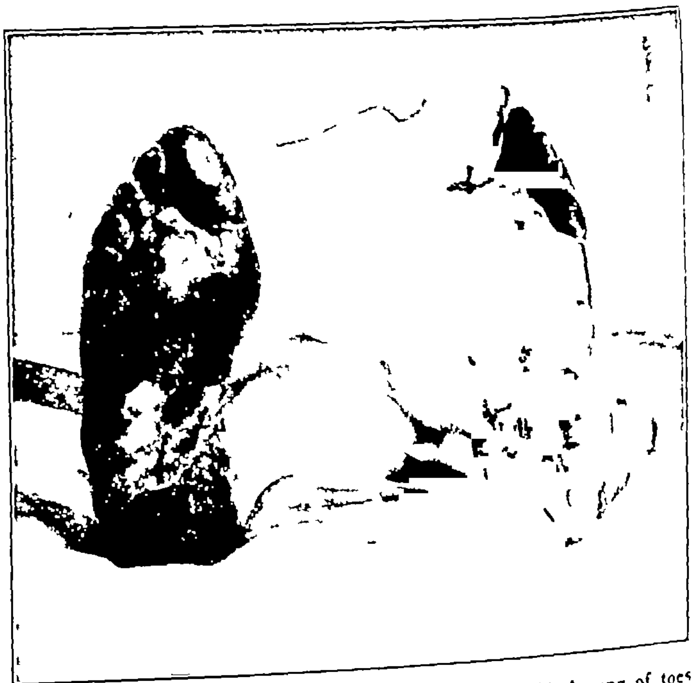

Fig 2 —Superficial abrasions on soles of feet and blackening of toes (gangrene) in case of trench foot in which tetanus developed

Out of a large number (statistics are not popular at the present writing) of sick and wounded which have passed through this hospital in the last nine months, there have been only eight cases of tetanus, and only in two cases did tetanus develop when the prophylactic dose had been given

In considering the fatal outcome of this case of trench foot tetanus, in which a prophylactic dose of antitetanic serum had not been given, and in view of the excellent results obtained by prophylactic doses in the wounded, the conclusion is that it would be a reasonable rule in military surgery to consider all cases of trench feet as in a class with the wounded, and give these patients also a prophylactic dose of antitetanic serum

EARLY DEATH FROM CEREBRAL SYPHILIS, WITH SUCCESSFUL RABBIT INOCULATION

REPORT OF A CASE *

MATHEW A REASONER M D
Captain Medical Corps U S Army
WASHINGTON D C

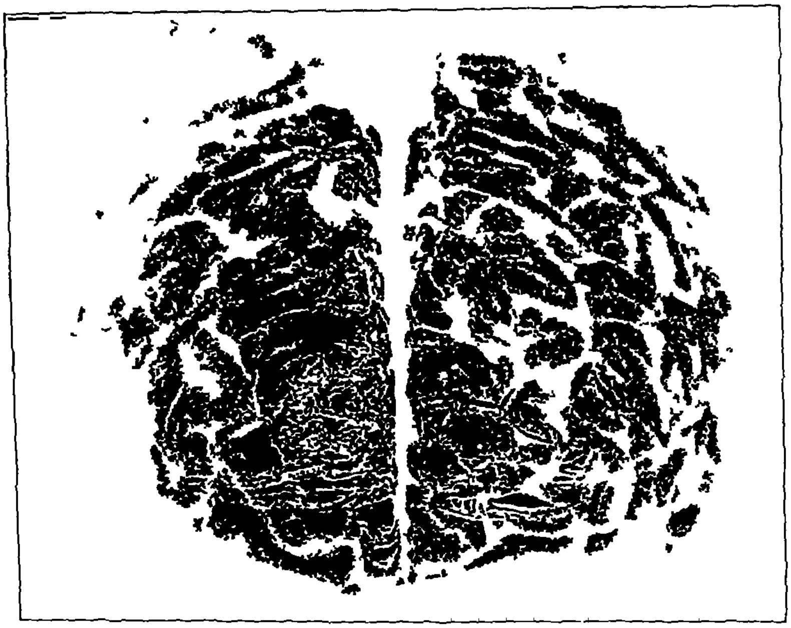
History—Mr X., aged 30, after intercourse Jan 1, 1915 had a large indurated lesion on the penis about Feb 13, 1915 On the request of his physician, Dr Victor H Esch of this city I made a dark-field examination Feb 27, 1915 The examination was negative, probably due to the prior use of calomel powder The Wassermann reaction showed complete fixation

Between February 27 and June 1, 1915, the patient received two intravenous injections of 0.9 gm neosalvarsan and twenty-four intramuscular injections of salicylate of mercury Wassermann tests made on June 2 7 and 8 were all negative. The patient now believed himself cured and stopped treatment despite the advice of his physician to the contrary

During August, 1915, he developed severe headaches, which were more acute at night. He had several attacks of vomiting He also had two convulsions, during which he lost consciousness He described the headaches as being so severe that he felt impelled to strike his head against the wall to relieve the pain.

About September 1 he returned to his physician, who at once began the use of inunctions of mercury I saw the patient in consultation on September 7, at which time a lumbar puncture was performed Examination of the spinal fluid gave the following results globulin + + Lange colloidal gold test, 2-3 3-2-1-0-0-0-0-0 cells 184, Wassermann, complete fixation in 0 5 0 3 and 0 1 c.cm quantities The blood Wassermann reaction also showed complete fixation I believe good judgment was shown in starting the treatment on September 1 with mercury In cases of nervous involvement it seems to me that there is less danger from a Herxheimer reaction following the use of salvarsan if there has been some preliminary mercurial treatment At this time, on the request of Dr Esch, the patient was transferred to my care The following day, September 8, he was given an intravenous injection of 0.3 gm salvarsan, without untoward manifestations resulting His headaches ceased within twenty-four hours, but again he neglected continuous treatment He returned at the end of two weeks with his headaches as severe as before and with a history of having had several convulsions He was at once given another 0 3 gm salvarsan injection intravenously, and the inunctions and injections of mercury were resumed The mercury was given to the limit of toleration, and again his symptoms rapidly subsided He had three or four convulsions during the first two weeks, and after that seemed to be doing quite well His mental condition improved, though he still remained somewhat forgetful and apathetic He gained 8 pounds in weight and returned to work The patient objected both to another lumbar puncture and to intraspinal medication, which seemed advisable, but, due to his apparent general improvement, this was not insisted on The patient, however, agreed to have this done later if necessary At no time were there localizing manifestations or disturbances of vision or hearing At the end of six weeks, the Wassermann reaction still showed complete fixation

On the night of Nov 18 1915, he developed a series of epileptiform convulsions He did not regain consciousness and died at the end of about six hours



Photograph of brain showing lesion

Postmortem Examination—The postmortem was performed by Dr William H Hough after embalming The brain was moderately congested, but there was no flattening of convolutions There was slight opacity of the arachnoid membrane over the anterior half of brain, more noticeable over the rolandic area The base showed no abnormalities The only gross lesion manifest was located, as will be noted in the illustration, in the anterior portion of the convex surface of the right frontal lobe and was about 3 5 cm in diameter Firm adhesions existed between the lesion and the overlying dura The ventricles, as well as the choroid plexus, were apparently normal On section, the lesion was seen extending through the cortex to the medullary substance and appeared as a grayish-red discoloration Sections examined were from the lesion, rolandic area, normal frontal, occipital cerebellum and hippocampus Microscopic examination of the lesion showed several small gummas in the pia and extending into the cortex with the presence of many newly formed blood vessels and endothelial proliferation and thickening of the walls of the older vessels, some of these vessels being apparently thrombosed The pia-arachnoid showed in places marked round cell production and new blood vessel formation, and many of the blood vessels of the cortical portion showed circumscribed round cell infiltration. One spirochete was found in Levaditi section Microscopic examination of other parts of the brain was negative except for slight evidences of meningeal inflammation (endothelial proliferation thickening of blood vessel walls and some round cell production) noticed over the rolandic area

Here then, is the interesting condition of a man whose death was due to cerebral syphilis, ten and one-half months from the date of infection He was treated adequately during the first three and one-half months, and received intensive mercurial treatment and two salvarsan injections during the last two months He presented no signs of spinal irritation, special sense involvement, or other localizing manifestations His only gross lesion has been described

---

* From the Department of Pathology Army Medical School Washington D C

* Presented before the District Medical Society Washington D C Jan 19 1916

The spinal fluid in this case contained the *Spirochaeta pallida* as was shown by injection into the testicles of a rabbit If there be such a thing as a highly invasive strain or one having a predilection for the nervous system, any characteristics peculiar to such a strain should be manifest in this one Two other cases, in which infection was contracted from the same source, are now being followed The results of the study of this strain in the rabbit will be published later in conjunction with the findings from a number of other strains, obtained from various sources It is interesting to note that this strain shows the same tendency toward eye involvement in the rabbit, noted by Nichols[1] in the Nichols and Hough strain, obtained from the spinal fluid of a neurorecidiv

AN UNUSUAL STOMACH CASE

WITH ROENTGENOGRAPHIC FINDINGS

GEORGE E BROWN, MD
MILES CITY, MONT

History—G R, woman, aged 29, came to my office with a history of chronic stomach trouble dating back fifteen years Family history was negative Personal history contained nothing of importance except the excessive use of beer and cigarets There was no history or evidence of syphilis The patient had noticed the present stomach trouble for fifteen years, consisting of attacks of epigastric pain and vomiting The pain was of the burning type without relation to meals nor was relief obtained by food Excessive belching and regurgitation of food were also present at times The vomiting took place directly after meals and twice was pure blood One year ago, fainting followed the vomiting of a large amount of fresh blood The patient was examined by prominent surgeons in the Middle West eleven years ago, and the condition diagnosed as gastric ulcer Six months ago, the patient had an acute attack of appendicitis, and the appendix was removed by another physician This was actively inflamed, according to her statement, but its removal had no influence on the gastric symptoms

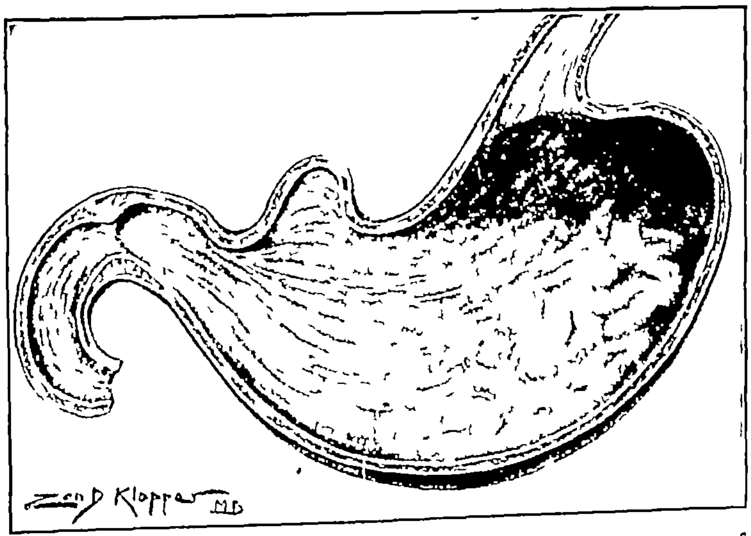


Fig 1—Artist's drawing, showing pouch involving all coats of stomach, no spasm was present when stomach was explored

Examination—Physical findings were negative There was no abdominal tenderness Gastric findings Lavage was bloody after a test meal, the meal also contained red blood Total acid was 40, and free hydrochloric acid 20 At a second examination, total acidity was 67, free, 45 There was an excess of mucus, and microscopic examination showed a few yeast cells, many diplococci and staphylococci The stools gave a positive benzidin test for occult blood The urine was negative

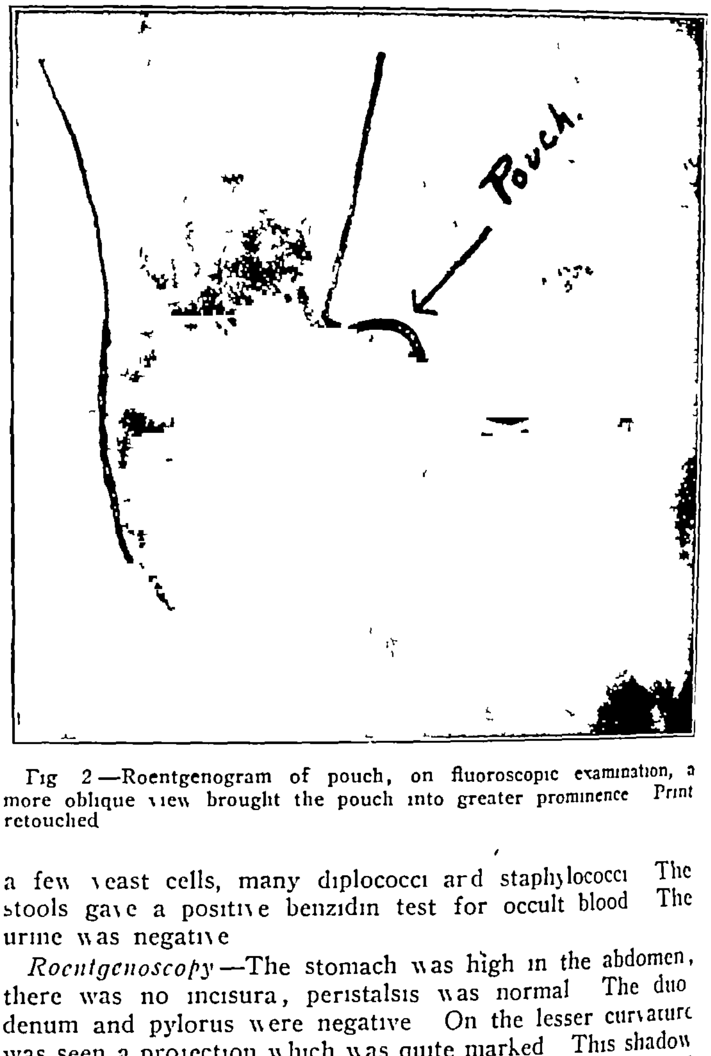

Fig 2—Roentgenogram of pouch, on fluoroscopic examination, a more oblique view brought the pouch into greater prominence Print retouched

Roentgenoscopy—The stomach was high in the abdomen, there was no incisura, peristalsis was normal The duodenum and pylorus were negative On the lesser curvature was seen a projection which was quite marked This shadow was permanent, and peristalsis on the lesser curvature seemed to commence on the pyloric side of the mass which did not partake of any peristaltic wave, while on the greater curvature waves started at the usual site There was no marked tenderness over this area There was no 6 hour residue The stomach was freely movable The patient was reexamined two weeks later with similar findings regarding the mass on the lesser curvature A series of six plates showed this very distinctly and constantly

Operation—The diagnosis was in doubt We decided that gastric ulcer was the most logical diagnosis, and as her condition was unsatisfactory on medical treatment, an exploratory operation was done by my associate, Dr W H Buskirk I will report his operative notes verbatim "Median epigastric incision, stomach delivered into wound No external signs of ulcer On lesser curvature a small outpouching of stomach wall was found, corresponding to deformity shown in x-ray plates This was about the size of an English walnut, and resembled a hernialike weakening of the stomach wall No evidence of ulcer near this pouch A transgastric incision 1½ inches long made into stomach, and interior carefully explored No ulcer nor growth found Mucous membrane bleeds with most gentle handling Pylorus admit index finger Duodenum negative Stomach incision closed The hernia on lesser curvature plicated with three linen sutures"

Postoperative Course—The patient made a rapid and uneventful recovery and left the hospital in ten days, feeling fine She was seen at varying intervals in the following year, and was much improved, but an indiscretion in diet or an excess of alcohol would bring on many of her original symptoms as it was impossible to control her habits and mode of living

---

[1] Nichols, H J, and Hough, W H Demonstration of Spirochaeta Pallida in the Cerebrospinal Fluid, THE JOURNAL A M A, Jan 11, 1913, p 108

COMMENT

This case is of interest not alone because of its clinical rarity, but also from the fact that the roentgenologic findings were deceptive The mass on the lesser curvature resembled the roentgenologic picture of penetrating ulcer, though no incisura was present

The clinical findings were also deceptive, namely, hematemesis, occult blood in stools, gastric pain and vomiting

I can find no mention of any similar condition in the textbooks, though I have not made an exhaustive search of the literature

The diverticulum was very pronounced, when the stomach was examined The examining finger of the surgeon could be inserted into this pouch, which was apparently a hernia of the stomach wall

---

FECAL CONCRETIONS OF THE APPENDIX

DEMONSTRABLE BY THE ROENTGEN RAY *

JOHN DOUGLAS, M D
Fellow of the American College of Surgeons
AND
LEON THEODORE LEWALD, M D
Instructor in Roentgenology, New York University Director Roentgen Department St Luke s Hospital
NEW YORK

Concretions in the appendix, formed, as they are, of hardened, more or less inspissated fecal matter, are rarely opaque to the Roentgen ray and are therefore usually not demonstrated by roentgenographic examination If bismuth or barium has been previously given for gastro-enterologic examination, a persistent residue in the appendix may sometimes be due to the coating of the concretion with the opaque substance

When, however, owing to the inflammatory reaction of the tissues, calcium salts are deposited on the surface of the fecalith, it may become demonstrable The condition is similar to that which occurs in cholelithiasis Gallstones forming as a result of pure cholesterin precipitation cause no shadow Those in which infection and resulting inflammation of the gallbladder have caused a deposit of calcium salts to coat or become mixed with the cholesterin become opaque

The following two cases are reported to show the possibility of such a fecalith being mistaken in a roentgenogram for a ureteral calculus on the right side, unless the roentgenogram is taken with opaque ureteral catheters in the ureters One case from the literature, however, and one case from a personal communication, show that even this is not an infallible means of differential diagnosis

Case 1—A man C aged 21 a painter, became ill three weeks before admission to the hospital, with pains in the right iliac region vomiting and fever The attack lasted five days Pain gradually disappeared but reappeared two days later in the same spot and persisted up to his admission to the hospital There was no further vomiting or temperature elevation, his appetite was fair and his bowels had been irregular On admission his temperature and pulse were normal The leukocyte count was 15,500 with 78 per cent of polymorphonuclear cells, on the following day the leukocyte count fell to 10,000, with 66 per cent of polymorphonuclears

Physical examination demonstrated slight rigidity and tenderness in the lower part of the right inguinal region, but no mass could be felt On rectal examination a sense of resistance was felt in the right side of the pelvis above the prostate, and a slight mucopurulent discharge from the rectum was present

Roentgenographic examination showed a shadow in the right side of the pelvis (Figs. 1 and 2), and a diagnosis of acute appendicitis with abscess which had probably perforated into the rectum was made The shadow was believed to be a fecalith

On operation it was found that the appendix had sloughed off about 1 cm from its base, and a fecalith about 2 by 1 5 cm in diameter was found in a cavity below the cecum between the rectal wall and the right pelvic wall It appeared as if the fecalith might have been formed by leakage from the appendix stump, which was still patent

Case 2—W T, aged 23, was admitted to St Luke's Hospital with a history of acute appendicitis of three days' duration Temperature on admission was 102.8, pulse, 128

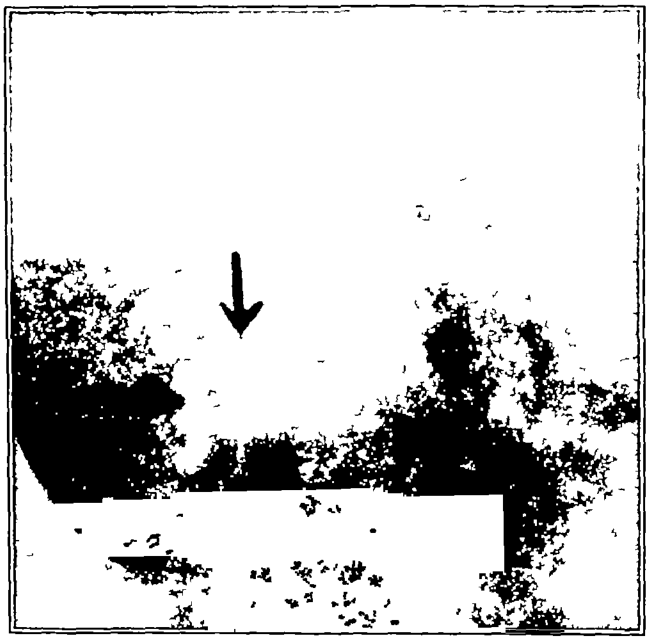

Fig 1—Arrows point to shadow in the region of the appendix diagnosed as fecalith by Roentgen examination diagnosis confirmed at operation For appearance of fecalith after removal see Figure 3

Physical examination revealed an indefinite mass in the right lower quadrant with marked rigidity and tenderness over the whole abdomen No Roentgen examination was made

On operation a gangrenous appendix was found which had perforated but still contained a large, hard fecalith A spreading peritonitis was present

The concretion was so hard that it prompted the idea of testing its density in comparison with the concretion from Case 1 and that of two ureteral calculi which had been demonstrated by roentgenographic examination before removal from other patients The result, illustrated in Figure 3, showed that this also would certainly have appeared on a roentgenographic plate

Pfahler and Stamm[1] state that "only one case has been diagnosed before operation This was discovered accidentally by Weisflog in 1906 who, while searching for a ureteral stone by means of the Roentgen ray,

---

* Read before the Surgical Section of the New York Academy of Medicine April 7 1916

[1] Pfahler and Stamm Diagnosis of Enteroliths by Means of the Roentgen Ray Surg Gynec. and Obst 1915 xxi 14

found two stones in the appendix" They report two other cases, one of an enterolith in the cecum, the other of two fecaliths in the appendix

In addition to these reports, isolated cases have been reported within the last few months Hunner[2] of Johns Hopkins reported a case of fecalith of the appendix demonstrated by the Roentgen ray but diagnosed as a probable ureteral calculus, although the possibility of its being in the appendix was stated Stewart[3] reported a case in which a shadow in the right inguinal region was diagnosed as a possible concretion of the appendix, and at the operation it proved to be such, and had apparently escaped from a ruptured gangrenous appendix

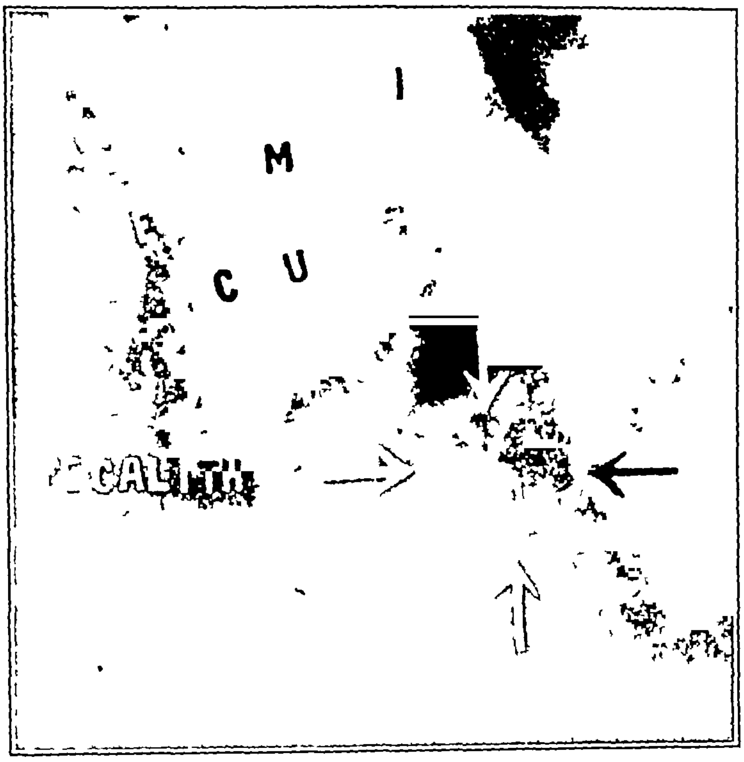

Fig 2—Arrows point to shadow in the region of the appendix diagnosed as fecalith by Roentgen examination, exposure made six hours after opaque meal diagnosis confirmed at operation For appearance of fecalith after removal see Figure 3 I, ileum

Case[4] reported two cases in which a concretion in the appendix had been correctly diagnosed by Roentgen examination and afterward confirmed at operation

Seelig[5] reported a case in which the history, physical signs, ureteral catheterization and Roentgen examination all indicated ureteral calculus, but on operation none was found The obstruction in the ureter was caused by a subacutely inflamed appendix being adherent in front of the ureter, and the shadow in the roentgenogram was due to a fecal concretion in the appendix

Eastmond[6] reported a case almost identical with that of Seelig

The patient, man, aged 38, had several attacks of pain high up on the right side Roentgen examination showed a shadow just above the transverse process of the third lumbar vertebra on the right side about the outer margin of the psoas muscle. Exposure made with the opaque catheter in the ureter showed an apparent obstruction at the point of the suspicious shadow and close approximation of the catheter and the shadow, so that the suspicious shadow was believed to represent a stone in the ureter At operation, an anterior incision having been made, the appendix was found with its tip firmly adherent to the ureter and compressing it, causing obstruction The tip of the appendix contained a concretion which accounted for the shadow noticed in the roentgenogram The concretion was oval with its longest diameter vertical, so that this very much simulated a ureteral calculus

On removal of the appendix, a catheter passed up from the bladder showed the ureter free

It would appear, therefore, that in a small number of instances a fecalith of the appendix may be demonstrated by roentgenographic examination, and that this fact must be taken into consideration when making a diagnosis

Usually the passage of opaque ureteral catheters will be of the greatest assistance in differential diagnosis, but the two cases reported by Eastmond and Seelig demonstrate that even with this assistance a mistake may be made

As a further aid in Roentgen diagnosis, we would suggest that when the shadow is above the crests of the iliac bones, a *lateral* stereoscopic roentgenographic examination be made, preferably with an opaque catheter in the ureter on the suspected side In a case recently examined in this way we were able to distinguish what is probably a calcified lymph node from a supposed ureteral calculus

If there is still doubt, a Roentgen examination, combined with an opaque meal or enema, may show the relationship of the suspicious shadow to the appendix or cecum, as in Case 1 (Fig 2)

Finally, we would call attention to the possibility of one encountering a left sided appendix due either to a nonrotation of the colon or to a complete transposition of all the viscera One of us (Le Wald) has encountered the former condition in three persons, and the latter condition in twelve A shadow on the left side, therefore, may represent a calculus in the appendix unless a Roentgen examination shows the cecum on the right side [7]

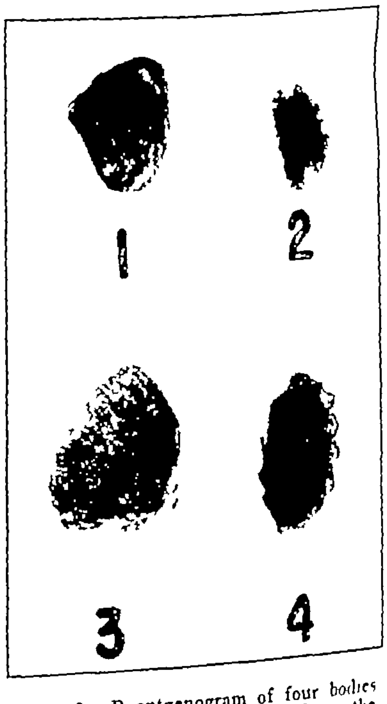

Fig 3—Roentgenogram of four bodies of about equal density, two from the appendix and two from the ureter 1, an appendix concretion in a case of acute gangrenous appendicitis 2, ureteral calculus, 3, concretion from the appendix diagnosed by Roentgen examination as a ureteral concretion prior to operation, 4, ureteral calculus Exact size

[7] Since the preparation of this article for publication a third case has come under our care D F, a girl 2 years of age was referred to St Luke's Hospital by Dr J F Bell of Englewood, N J with a diagnosis of acute appendicitis A Roentgen examination made for the purpose of excluding the possibility of a right side central pneumonia (two previous cases of this nature having come under our observation) disclosed a shadow in the appendix region and no pneumonia Operation revealed an acutely inflamed, gangrenous appendix containing a concretion corresponding in size to the shadow on the Roentgen plate Roentgen examination of the removed appendix further confirmed the identity of the shadow

New Instruments and Suggestions

A SIMPLIFIED METHOD OF ADMINISTERING SALVARSAN

Frank A. Brayton, M.D., Indianapolis
Senior Assistant in the Department of Skin and Syphilis Bobbs and City Dispensary

For eighteen months I have been administering salvarsan intravenously by the means of a 30 c.c. syringe. The manufacturers of this product have always advised that larger amounts of water be used (250 c.c. for 0.5 gm.). I have no hesitancy in giving 0.6 gm. in 30 c.c. of water. The results obtained have been so consistently successful that I think a description of the method employed not amiss.

In the directions for giving neosalvarsan it is advised that the drug (0.9 gm.) be given in 150 c.c. of water. In connection with my associates in the Bobbs and City Dispensary I have given 3,000 injections of neosalvarsan (0.9 gm.) in 10 c.c. of water, using an ordinary glass syringe. The number of reactions was much less in this series of cases than when the gravity method was used and the solution was made up to 150 c.c. owing to the fact that the so-called "water-faults" were eliminated. I am confident that the same holds true for salvarsan.

The apparatus necessary for preparing the solution and administering the injection is very simple, as shown by the illustration:

1. One 30 c.c. Lüer syringe with needle.
2. One glass-stoppered 60 c.c. shaking bottle.
3. One bottle of 15 per cent. sodium hydroxid with medicine dropper.
4. One 50 c.c. funnel.

TECHNIC

The apparatus is sterilized by boiling in freshly distilled water in an 8 inch aluminum pan. The shaking bottle containing approximately 30 c.c. of boiling water is removed from the pan, and the salvarsan is added. It is then shaken until a clear solution is obtained. Glass beads in the shaking bottle facilitate the preparation of the solution. Fifteen per cent. sodium hydroxid is added until the precipitate which at first forms is dissolved. The solution is then filtered through a pledget of sterile cotton in the funnel directly into the barrel of the syringe. The plunger of the syringe is inserted and the needle attached. The air is expressed from the syringe and the solution is then ready for injection. The procedure is the same as for any intravenous injection in which a syringe is used. Any all-glass syringe is suitable.

TABLE 1.—PRIMARY STAGE: FORTY-SIX PATIENTS

Dose, Gm.	Number of Injections	Reaction*: Slight	Moderate	Severe	None
0.4	154	4	3		149
0.6	36	1	2		31

TABLE 2.—SECONDARY STAGE: FORTY-FOUR PATIENTS

Dose, Gm.	Number of Injections	Reaction*: Slight	Moderate	Severe	None
0.4	190	6	5		179
0.6	36	1	2		33

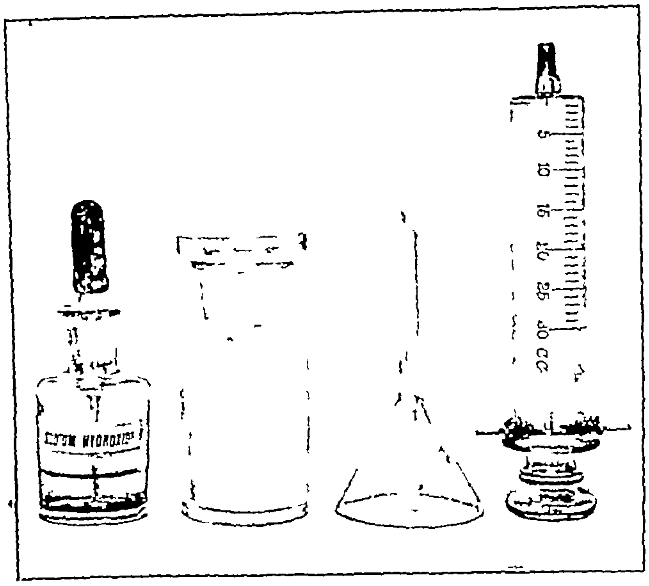
TABLE 3.—TERTIARY STAGE: FORTY PATIENTS

Dose, Gm.	Number of Injections	Reaction*: Slight	Moderate	Severe	None
0.4	178	4	5		169
0.6	10	1			9

* By "slight reaction" is meant flushing of face, nervousness and slight acceleration of pulse lasting only a few minutes. By "moderate reaction" is meant headache, chills, fever and pain lasting not over four hours. By "severe reaction" is meant headache, chills, fever, vomiting, diarrhea, vasomotor disturbances and collapse.

The accompanying tabulations of 604 injections show the reactions obtained.

These tables show that seventeen reactions were observed classed as slight. *In the true sense of the word, they should* not be classed as salvarsan reactions, but as psychic manifestations due to fright, etc. All patients who have complained of a "sense of fulness" in the face, slight dizziness, or "funny sensations" are recorded under this heading.



Apparatus used for administering salvarsan with a 30 c.c. syringe.

In seventeen instances moderate reactions are recorded. None of these lasted over four hours, and the majority not over two hours.

In 570 injections no reactions were observed.

ADVANTAGES

The chief advantages of this method are:

1. Time and labor are saved. The apparatus can be sterilized, the solution prepared and the injection given in seven or eight minutes. This is especially desirable in dispensary practice where the time is limited and several injections must be given. There is no complicated and cumbersome apparatus to be sterilized. The solution may be administered in thirty or forty seconds with the syringe, whereas with the gravity apparatus it often takes from twelve to fifteen minutes for the solution to run through the needle, which must of necessity be of small caliber in some cases.

2. The method is less dangerous than the gravity method. In the latter an untrained and inexperienced operator is not always certain that he has entered a vein, nor does he know when the needle has slipped from or pierced through the vein during the procedure. When using the syringe, if he is at any time in doubt he may readily assure himself that the injection is moving properly by pulling back the piston and noticing the return of blood into the glass tip of the barrel of the syringe. Further, there is no danger of air entering the vein.

3. The number of salvarsan reactions is less than when larger amounts of water are used. The greater the dilution the greater will be the number and severity of reactions due to the so-called "water faults." In 30 c.c., "water faults" are practically eliminated.

4. By using this technic, the giving of salvarsan becomes *a one-man operation.*

ADDENDUM

Since writing this paper I have given to sixty-five patients a series of 342 injections of arsenobenzol, the arsenic compound prepared by the Dermatological Research Laboratories of the Philadelphia Polyclinic under the direction of Dr Jay F Schamberg The 0 4 gm dosage was used in the 30 c c dilution, and the injection given with a syringe in all cases In no one of these patients has there been a reaction of note Seven of these patients following the injection at varying intervals of from one to four hours have complained of headaches which might or might not have been due directly to the administration of the drug Clinical results accomplished by the use of arsenobenzol have been equally as good as the results obtained from the use of salvarsan I am firmly convinced that its toxicity is lower than that of salvarsan, as can readily be seen by comparing the results of these 200 injections with the 600 injections reported above

330 Newton Claypool Building

MODIFICATIONS OF MacKENZIE INK POLYGRAPH

R Edwin Morris, M D, Minneapolis

Teaching Fellow, University of Minnesota Medical School, Minneapolis

Certain modifications of the MacKenzie ink polygraph have been made and have proved of definite value in our work in the University Hospital These are as follows

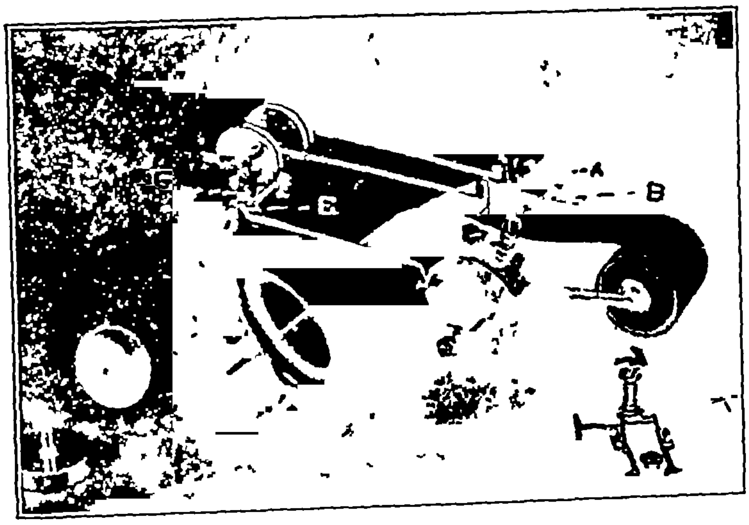


Fig 1 —Original MacKenzie polygraph

1 The spring *A*, which holds the roller *B*, has been replaced by a bridge *C*, which is provided with set screws *D*, these can be adjusted so as to regulate at will the pressure on the axle by the spring, thus adjusting the paper feed This substitution has resulted in a much more perfect control of rate in supplying the paper

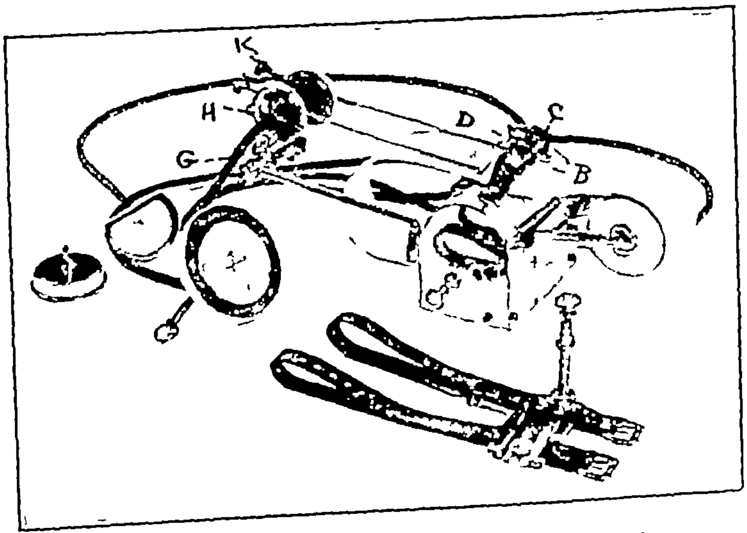

Fig 2 —Modified polygraph, dismounted Showing modifications

2 The distal portion of modification ring *E* (Fig 1), has been removed, with part of the outer surface of the ring thus leaving a shoulder (*F*, Fig 3), which permits tension These changes permit the tambours to be detached much more readily and allow definite ease of adjustment

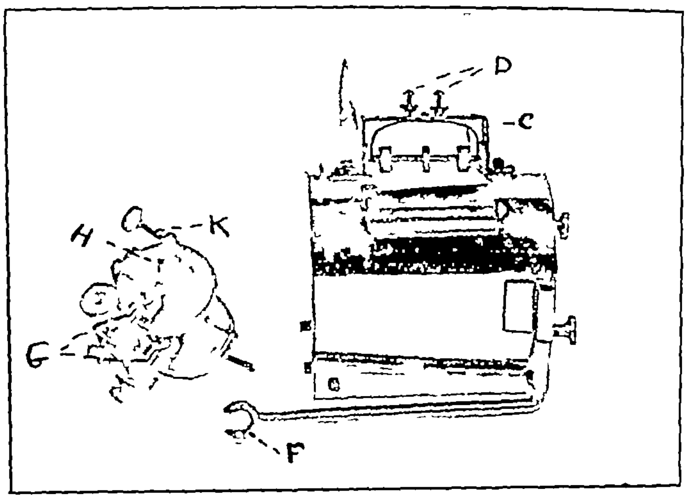

Fig 3 —Modified polygraph assembled

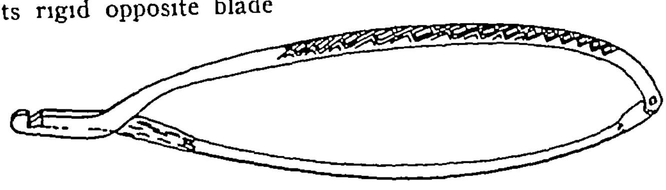
3 To the upright (*G*) of each tambour support a stationary vertical bar (*H*) has been attached, through the upper end of which runs a micrometer screw (*K*) which permits a delicate and accurate control of the pens This modification corresponds to the fine adjustment of a microscope and permits rapid, accurate and independent adjustment of the pens at will

NEEDLE HOLDER

W P Megrail, M D, Wheeling, W Va

This needle holder consists of two blades and a screw or rivet which connects the blades and forms a hinge at the proximal end of the instrument The rigid blade has a suitably curved handle and a hook shaped jaw at the distal end, and near the jaw is a slot through which passes freely the opposite spring blade, which has a jaw on its distal end

Very slight pressure on the handles tends to straighten the spring blade, and forces its jaw against the hooked jaw of its rigid opposite blade



Needle holder

A slight projection near the distal end of the spring blade prevents the jaws from opening too wide

The advantages of this instrument are

It is simple, having only three parts

It is not apt to get out of order

It has a powerful grip, which is the application of what is known in mechanics as the "toggle joint"

It will hold any needle, and is not so liable to break them because it grasps them on the edge instead of on the thin flat or curved sides

Consumptive Wins Suit—A citizen of Toronto a short time ago brought action against a well known manufacturing jewelry firm charging that he had contracted tuberculosis while in the employ of the company This, he claimed was the result of negligence on the part of the employers in not providing proper ventilation of the building, dust and fumes being not properly removed The jury deliberated for several hours and brought in a verdict in favor of the plaintiff, awarding him damages to the extent of $3,000 This is believed to be first case of its kind ever tried in Toronto

HISTOLOGIC TECHNIC

L. W Strong, M D, New York
Pathologist, Woman s Hospital

The following modifications of current histologic methods were devised to shorten the time for making routine reports on histologic specimens It is always possible to harden and embed any individual specimen rapidly, but this implies a departure from the regular routine

These modifications are adaptable as regular routine, and reduce the time for reports to three days with an additional saving of labor and reagents, very considerable in itself The resulting hardening fixation, dehydration and clearing of the tissues leave nothing to be desired

1 Ten per cent liquor formaldehydi in 80 per cent alcohol, over night.

2 Ninety-five per cent alcohol until say, 4 p m

3 Acetone, from one half to two hours, at convenience

4 Chloroform-paraffin over night in a warm place.

5 Paraffin, four hours

6 Embed

This embodies the least handling and the most convenient intervals

It will be found of the greatest convenience to have a wooden rack made with cells just large enough to hold the proper stock laboratory bottle, three rows deep and, say twelve long The first row of bottles contains formol-alcohol, the second 95 per cent. alcohol, and the third acetone This wooden rack obviates the necessity of writing numbers on bottles or labels prevents error from misplaced bottles and enables the reagents to be used repeatedly or until weakened Case numbers are printed for a thousand or more in advance on small slips and each new case has its slip placed in the front row of cells where it stays until the specimen leaves the rack

In embedding in paraffin, aluminum muffin tins will be found most serviceable one sheet holding from six to eight cases

All specimens coming to the laboratory during the day are described at a set time, late in the afternoon Sections are taken then and placed in the formol-alcohol The following morning they are advanced into 95 per cent alcohol where they remain until just before the day's specimens are described when they are advanced into acetone After the day s specimens are described, the acetone specimens are placed in chloroform-paraffin on the top of the paraffin oven over night

On the following morning they are placed in 48 degree paraffin for two hours and 52 degree paraffin for two hours, and are then embedded

An Inexpensive Container for Use in Staining Acid-Fast Bacilli—Often in the daily routine it becomes necessary to make a stain for acid-fast bacilli We are familiar with the ordinary method of preparing the slide or cover glass with the addition of the stain and consequent heating To avoid the usual phenomenon that of spilling the stain an ordinary nickel plated metal shaving stick soap container may be employed These containers are in one piece with or without hinged cover (the latter preferred), and have a capacity of over 50 c.c. Several slides may be stained at one time When not in use, the containers are practically air-tight preventing evaporation of the stain—George D Horton Bacteriologist, Missouri State Poultry Experiment Station Mountain Grove Mo

Therapeutics

HEMORRHAGIC CONDITIONS

(*Continued from p 1779*)

TRANSFUSION OF BLOOD

The idea of introducing healthy blood into the circulation of a person threatened with death either from chronic disease or from some acute accident is not a new one Early it became evident that there were certain objections to the introduction of the blood of lower animals into man, and the practice fell into disuse During the last century, experiments were made on the direct transference of the blood from one person to another This was attempted by means of rather complicated apparatus and under certain handicaps which, now, may be avoided The earlier attempts of this sort were made before the days of perfect aseptic technic, and infection sometimes followed the operation of transfusion Recently, because of an increased interest in the possibilities of transfusion, there have been published descriptions and results of several new methods These methods tend to the elimination of those factors that are responsible for untoward symptoms following transfusion As a result, transfusion in the hands of a trained and experienced operator is fraught with little or no danger to either the donor or the recipient of the blood This fact has led investigators to experiment on many different types of disease in which previously it would not have been deemed advisable to transfuse

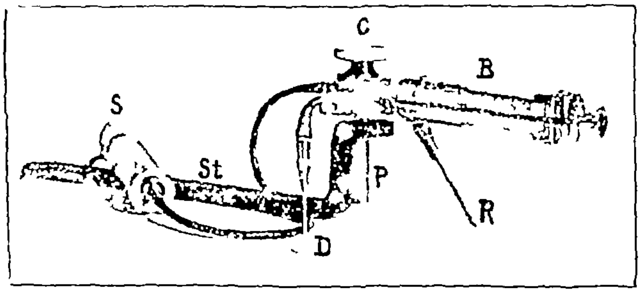


Fig 1—Unger s instrument for syringe transfusion *C* s op-cock, *B* blood syringe connected to blood outlet *S* saline syringe connected to saline outlet *D* donor s cannula connected to donor s ou let *R*, recipient s cannula connected to recipient s outlet *St* stand *P* pedestal by which the stop-cock is raised or rotated

When transfusions were first attempted, and even up to recent years, little thought was given to the physiology of the blood and to the part played by changes produced in the blood during the progress of the transfusion With a knowledge of the processes concerned in coagulation, and also with the perfection of simple and reliable methods for testing the properties of the blood plasma and red blood corpuscles, unfavorable results, due to the infusion of the blood itself, are uncommon Untoward symptoms do not occur in more than 10 per cent of the transfused cases Some of these are trivial and do not last long, others, however, may be of a serious nature Some of the symptoms resemble those seen in serum sickness, with a rise in temperature, chills, and the appearance of an urticarial rash Others are of an anaphylactic character, accompanied by shock However, with properly conducted tests it may be stated that there need be no fatal cases traceable to the transfusion itself

Whatever untoward symptoms or fatal cases occur as a result of the transfusion may be traced to some disturbing element in the introduced blood, to the formation of a thrombus, to the introduction of an embolus, or to the dilation of an already weakened heart by too large an injection of blood or by a too great pressure exerted in the introduction of the blood

The introduced blood may have the property of agglutinating or hemolyzing the blood of the patient Recently, Satterlee and Hooker[1] have suggested three possibilities (1) a disturbed trypsin-antitrypsin balance in the recipient's blood resulting in the formation of a serotoxin, (2) the disturbance of the protective colloids in the body cells of the recipient, exposing them to a reaction of antigen and antibody in the circulation of the recipient, and (3) a toxic disturbance resulting from incipient coagulative changes produced by physical influences arising during the process of the transfusion

Agglutination and hemolysis can be avoided by preliminary tests *Infusion* of syphilitic blood can also be prevented by a complement-fixation test of the blood of the donor The problem of eliminating any other disturbing factors in the blood is still one to be investigated Although several anticoagulants have been suggested for the prevention of coagulation, so far only two have been advocated, herudin (an extract of leech) and sodium citrate, and of these the sodium citrate has been shown *to be the safer and more* reliable It has been found that herudin preparations, particularly those which have been prepared for some time, undergo a certain amount of chemical change with the production of a toxic substance Sodium citrate, on the other hand, has been used very successfully with no, or but very few, untoward effects

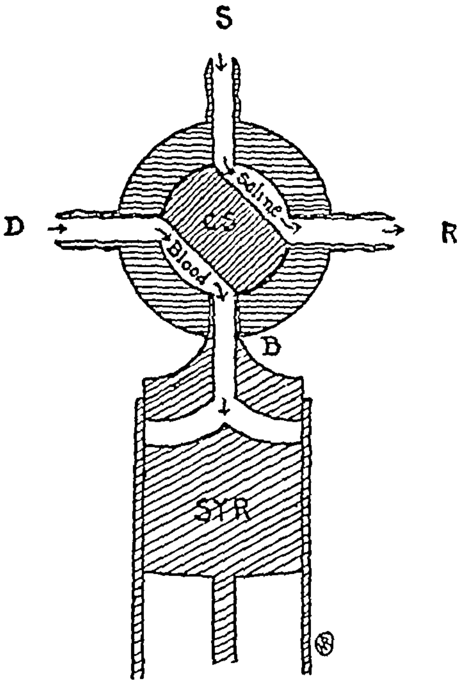

Fig 2 —Unger's instrument Donor's position *D,* donor's outlet, *B,* blood outlet, *Syr, blood syringe* Blood passes from donor's vein through *D,* out at *B* into *Syr S,* saline outlet, *R,* recipient's outlet Saline is forced from saline syringe through *S,* out at *R, into* recipient's vein Channel between *D* and *B,* donor blood circuit, that between *S and R,* recipient saline circuit *CS,* central stopper (rotates through an arc of 45 degrees)

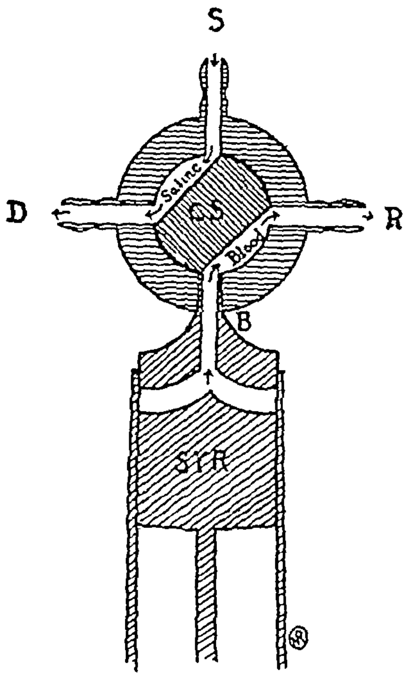

Fig 3 — Unger's instrument Recipient's position *Syr,* blood syringe, *B* blood outlet, *R,* recipient's outlet Blood is forced out of *Syr* through *B,* out at *R,* into recipient's vein *S* saline outlet, *D,* donor's outlet Saline is forced from saline syringe through *S* out at *D* into donor's vein Channel between *B* and *R* recipient blood circuit, that between *S* and *D,* donor saline circuit. *CS,* central stopper

METHODS

Transfusion methods may be divided into two kinds, the direct and the indirect By the direct methods are meant those in which the artery of the donor and the vein of the recipient, or the veins of each, are brought into contact either by being sutured or by being connected with a tube or with a cannula Carrell was perhaps the first to suture the vessels together, and although this method has been successful in some cases, nevertheless it has the disadvantage that it is too time-consuming, and that the amount of blood passing from donor to recipient cannot be measured This can also be said of most direct methods Time is consumed in dissecting out sufficient lengths of the vessels so that they can be easily handled A method of calculating the amount of blood transfused by means of frequent hemoglobin readings has been devised by Libman and Ottenberg[2] For the purpose of preventing clotting of blood during its passage, when the cannula or straight tube is used, these are treated with sterile paraffin or albolene These substances work admirably

The cannula method described by Crile[3] is typical of other cannula methods He uses a cannula through which he draws the proximal end of the divided vein and then turns back the end of the vein like a cuff over the end of the cannula Over this he then draws the proximal end of the divided artery The radial artery of the donor and the median basilic or cephalic of the recipient are used This is rendered comparatively easy by having the patients lie beside each other, but with their feet in opposite directions This operation brings into contact the intima of the artery with the intima of the vein and this greatly minimizes the liability to clotting of the blood

Transfusion by means of a connecting tube is described by Vincent[4] This consists in the use of glass tubes which are used to connect the vein of the recipient with the artery of the donor These tubes are usually from 3 to 8 cm in length In order to avoid clotting, the tubes are coated with various preparations, such as liquid petroleum, petrolatum, stearin or paraffin It was found that petrolatum made too soft a covering, and stearin too hard and rough a covering A mixture of petrolatum, paraffin and stearin in 2 2 1 proportions gives the smoothest and a sufficiently hard covering The blood was found to run well in plain glass tubes, they might be used with a fair chance of success if it were not practicable to use the coated tubes

Probably the first indirect method was the use of *defibrinated* blood, the fibrin having been removed after whipping up the blood This *method,* on account *of the possibility* of infection and red blood and platelet destruction, was given up *In 1913, Lindeman*[5] *announced a simple method* of transfusion which did not necessitate cutting down on and dissecting out the vessels of the donor and recipient Other advantages of the method were that it could be carried out rapidly, and that the amount of blood used could be accurately measured Lindeman's method consists of the use of several record syringes, each with a capacity of 20 c c

[5] Lindeman, Edward Simple *Syringe* Transfusion with Special Cannulas, Am Jour Dis Child, July, 1913, p 28

Two operators are required, and special cannulas are used. After the donor and recipient have been placed in recumbent positions, the veins to be used are selected. As a rule the median basilic is the vein of choice. In infants the external jugular is better on account of its large size and easy accessibility. A tourniquet is placed around the arm of the recipient, the skin sterilized and the cannula inserted into the vein. The tourniquet is removed, and to avoid escape of blood, a syringe filled with sterile saline solution is attached to the cannula until ready for use. The arm of the donor is treated in a similar manner, with the tourniquet above the site of puncture. After this has been done, the syringes are rapidly filled with blood from the donor's vein and injected through the cannula into the vein of the recipient. To prevent clotting, after each injection of blood a little sterile saline solution is injected into the cannula in the recipient's vein. Before a syringe is used a second time, it must be cleansed with sterile water. Dexterity and speed are necessary. Other advantages in this method are that both arms of the donor can be used at the same time, and that there is no permanent injury to the blood vessels. The same vein can be used repeatedly for other transfusions. In 155 cases in which a total of 136,800 c.c of blood was transfused, there was not one death referable to the transfusion[6] The adults received from 1,000 to 1,800 c c at each transfusion.

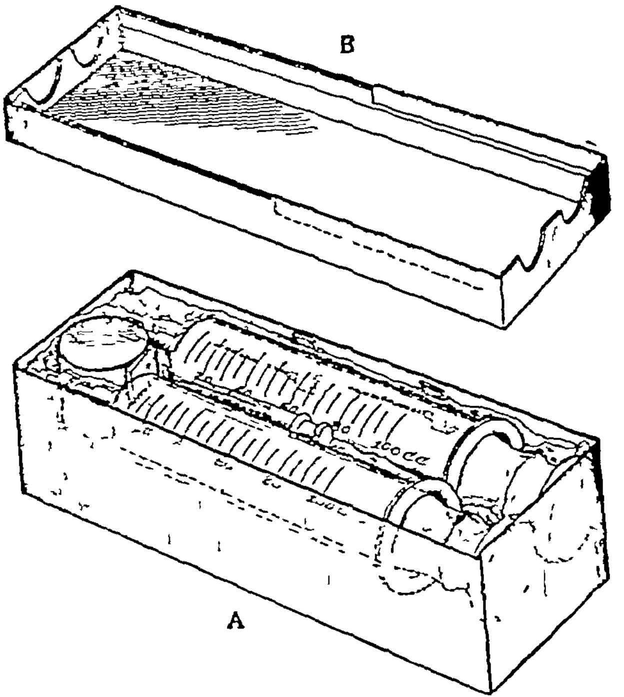

Fig 4—Abelmann's syringe apparatus *A* transfusion case packed which can be carried in the coat pocket *B* cover for case which when extended serves as syringe tray (Fig 5 *A*)

The Lindeman method, however, was open to several objections. These were the constant connecting and disconnecting of the syringe, namely, inability to gage the force with which the blood was injected each time and the risk of clotting inasmuch as the blood was exposed to the air when the syringes were disconnected. It also required the services of two operators both expert in the handling of the syringes.

To obviate these objectionable features, Unger[7] devised an apparatus with a central stopcock arrangement, the stopcock of which could be arranged so that the blood drawn out from the vein of the donor with a 20 c c syringe could be injected into the vein of the recipient with the same syringe. Needles or cannulas are inserted into the veins of both donor and recipient as in the Lindeman method, and these are connected with the apparatus. Only one syringe is required for this, and at no time is the blood exposed to the air. Another feature of the apparatus is that the passages traversed by the blood can be kept clean by flushing them occasionally with sterile saline solution by means of another syringe attachment. Very good results without secondary symptoms have been reported with Unger's apparatus.

A somewhat different method of indirect transfusion is the use of blood to which has been added an anticoagulant. It has already been mentioned that the anticoagulants which have proved most successful are herudin and sodium citrate. Herudin, however, under certain conditions develops toxic properties which should exclude it for transfusion purposes. Sodium citrate has proved very favorable, and has some good features to commend it. One of these features is that blood may be drawn from a donor into the citrate solution and carried to another place for use. It may be kept on ice for a week and used. It does away with the usual operating room technic, and may be injected into the vein of a patient at his home.

In describing this method, Weil[8] states that it is simple "Blood is aspirated from a vein and is at once well mixed with sodium citrate in 10 per cent solution in water, in the proportion of 1 c c of solution to 10 c c of blood. Exceptionally one encounters blood which requires slightly more or slightly less citrate proportionally" Lewisohn[9] has used this method, with slightly different proportions of sodium citrate, in twenty-five cases, the amounts of blood transfused varying from 900 to 1,600 c c. In most of these cases there was a diuresis lasting not over twenty-four hours.

THE TREATMENT OF EPIDEMIC MENINGITIS

Epidemic cerebrospinal meningitis is still sufficiently common in this country, as elsewhere, to create an interest in the therapy of this formidable disease. The success of the antimeningococcic serum devised by Flexner has made other modes of combating the infection seem superfluous, for the time at least. In harmony with what has been attempted in the case of other bacterial infections, compounds with antiseptic properties were long ago suggested as of possible value in treatment. Salicylates of mercury were included in the list. Even before the advent of the current serum therapy, however, clinicians questioned the value of the antiseptic substances. Thus Koplik[1] wrote, in 1907:

> The treatment of cerebrospinal meningitis in the past proves to the mind of the writer the futility of drugs. The disease is a self-limited one, much like pneumonia, its duration practically uninfluenced by any mode of treatment, the patients recovering with or without complications independently of the effects of any known drug.

Flexner and Amoss,[2] of the Rockefeller Institute for Medical Research, have called attention to a recent revival of the old plan to use antiseptic drugs directly in the treatment of epidemic meningitis. They point out two circumstances which from a purely theoretical standpoint might be expected to favor the chemical treatment. The infection tends to be local, within the cerebrospinal membranes, rather than general throughout the body; and the membranes involved are directly accessible from without so that the chemical substance can be brought into immediate relation with the seat of infection. To this may be added the fact that judging from its behavior outside of the body the meningococcus is not a highly resistant micro-organism; it is readily injured by chemical action and damaged by the products of its own growth. In the second place, there are immunologic differences between the different types or varieties of meningococcus known to occur as etiologic agents in the production of the disease. Inasmuch as such micro-organisms are subject to therapeutic influence through antiserums only when correspondence exists between the infecting type of micro-organism and the particular specific antibodies present in a serum, it would not seem unlikely that bactericidal chemicals might be less specific and therefore more certain in their curative effects, irrespective of the variety of micro-organism to be combated.

In harmony with the foregoing views, Wolff[3] has recommended the employment of protargol, a compound of protein and silver containing 8.3 per cent. of silver in organic combination and said to be useful as a nonirritant substitute for silver nitrate. Before the working out of the serum therapy, compound solution of cresol had been employed in the direct chemical treatment of epidemic meningitis as early as 1902. The demonstration of the susceptibility of two types of laboratory animals, monkeys and young guinea-pigs, to meningococcic infection has made it possible to institute more exact studies of curative measures than limited statistics on man can furnish in such a highly variable disease. When cultures of meningococci are injected into the peritoneal cavity in the guinea-pigs and into the subarachnoid space in the monkeys, the micro-organisms set up local inflammations, in the exudate attending which, the fate of the meningococci can be followed precisely as in the human cases of epidemic meningitis in which the cerebrospinal fluid is removed from time to time by lumbar puncture.

The results of tests conducted by Flexner and Amoss[2] with protargol and compound solution of cresol are consistent in showing that the chemicals are not curative but rather injurious in the experimental meningococcic infection of animals. The symptoms of the treated animals were intensified rather than ameliorated. In explanation of this result, the reverse of what might theoretically be expected, it must be understood that the key to recovery from meningococcic infection is furnished by the phenomenon of phagocytosis. Whatever promotes phagocytosis, under conditions in which the beneficent leukocytes remain potent, facilitates recovery. Flexner and Amoss have found that the chemicals are antileukotactic and antiphagocytic; they are cell poisons of considerable power. Hence, when the drugs are brought into relation with the seat of infection, they prevent the immigration of leukocytes on an adequate scale, and they reduce phagocytosis by such leukocytes as have entered the serous cavities. Moreover, they also injure and bring about degeneration of the leukocytes themselves.

The New York investigators explain that the resultant of this set of injurious activities is to open the way for a free invasion of the blood by the meningococci and for almost unrestrained multiplication in the serous cavities. Undoubtedly the chemicals do exert a direct bactericidal action on such meningococci as come under their influence under conditions of suitable concentration but not all the meningococci are thus destroyed Those which survive multiply almost without hindrance, while the absence of detoxicating power on the part of the chemical permits the disintegration products of the destroyed bacteria to exert their poisonous effects on the animal organism This is in marked contrast with the effect of the antimeningococcic serum which attracts leukocytes into the infected serous cavities, facilitates phagocytosis by supplying opsonin and promoting agglutination of the diplococci and further exerts a direct antitoxic action on the toxins liberated by the disintegrated micro-organisms

[3] Wolff, G.: Deutsch. med. Wchnschr., 1915, xli, 1486.

If, in the light of these newer experiments of Flexner and Amoss, the theoretical advantages expected to accrue from the action of bactericidal chemicals is more than offset by the harmful effects which they cause, the antiserum still seems to provide the logical therapeutic agent with which to combat epidemic meningitis Innocuous in itself, it promotes those processes essential to recovery from the disease

LOW EARNINGS AND DISEASE

The enthusiasts who emphasize, quite properly, the benefits which arise from the conservation of health often attempt to strike the popular imagination by venturing money estimates of the preventable wastes from disease and death The Report on National Vitality, prepared for the National Conservation Commission by Irving Fisher,[1] finds one and a half billions of dollars as the lowest estimate of the avertable loss from disease and death in this country It is even asserted that the true figures from the statistics available may well amount to several times this figure, but when statistics are based more or less on conjecture, they need to be stated with special caution

Of course, such figures have little significance beyond emphasizing the overwhelming importance of human vitality compared with those interests which are usually measured in money Disease means human misery which cannot be measured, it also means poverty and crime, twin evils, each playing into the hands of the other Although the pauperizing effects of ill health are indicated in such allusions as have been cited, *it is not always recognized with equal force that there is a 'vicious circle set up between poverty and disease, each of which tends to produce the other"* *Poverty is by no means always the outcome of a lack of earning capacity attributable to disease* For this reason it is sometimes advisable to emphasize the fact that although the practice of hygiene need not be a luxury of the rich alone, yet wealth may promote health To what extent the unfortunate poor may be able to remedy their hygienic lot need not be considered here The facts of the interrelation of poverty and disease need to be known first of all An interesting contribution of a statistical sort in this field has just been issued by the United States Public Health Service[2] It considers the health of garment workers in New York City in relation to their economic status Intensive budgetary investigations of wage earners' families in that large metropolis have afforded bases for several determinations and estimates of a *minimum* "adequate" family income in which a fundamental consideration was the minimum annual amount necessary to maintain the wage worker's family of five persons (man, wife, and three dependent children under 14 years of age) under healthful conditions of living These determinations and estimates agree that an annual family income of between $800 and $900 is the minimum amount necessary for this purpose in New York City If the statistics are classed in three groups according to the annual earning of family heads, under $500, from $500 to $700, and $700 and over, it appears that the poorest group has the largest average number of children per family The percentage of mortality of children in the group in which heads of families earned less than $500 a year was 82 per cent greater than, or nearly twice as high as, the percentage of mortality of children in the group in which the family heads earned $700 or more a year These data indicate the same general variations in child mortality among families of different incomes as those shown by some other recent investigations Approximately twice as great a proportion were poorly nourished in the group earning less than $500 a year as in the group earning $700 or more a year The proportion of individuals having hemoglobin percentages under 80 was over twice as high in the group earning less than $500 a year as in the group earning $700 or more a year It is interesting to note that not only was the proportion of anemic individuals greatest in the lowest income group, but also the average hemoglobin percentage was lowest in that group

TUBERCULOSIS AMONG HEADS OF FAMILIES ACCORDING TO INCOME

Annual Earnings of Family Heads	Total Number	Percentage of Family Heads Tuberculous
Under $500	372	5 64
From $500 to $699	566	5 30
$700 and over	456	44

Even more striking are the findings regarding the prevalence of tuberculosis The proportion of tuberculous individuals among the garment workers who were heads of families showed extremely wide variations when the highest and lowest income groups were compared The accompanying tabulation exhibits this comparison

THE BACTERIA OF MILK FROM NORMAL UDDERS

That the milk of healthy cows, even under ideal dairy conditions, is contaminated as soon as secreted was established in 1899[1] More recently, epidemics of sore throat[2] and appendicitis[3] traced to milk, have drawn particular attention to the presence of streptococci in normal udders, with respect to the nature and frequency of other types of bacteria in milk, almost nothing is known Yet in view of the fact that the number, especially of streptococci, in milk is proposed as an index to its healthfulness, and in view of the wide consumption of milk as the chief sustenance of infants and many invalids, the question of the frequency and the types of bacteria in certified milk calls for definite investigation Such an investigation has been reported by Evans[4] of the U S Department of Agriculture In a study of 192 samples of freshly drawn milk from 161 healthy cows of five different dairies supplying milk to Chicago and to Washington, D C, she has found a definite udder flora comprising bacteria of a parasitic nature — streptococci, micrococci and bacilli Long-chain streptococci, which may be virulent, were isolated from twenty-nine, or 15 1 per cent, of the 192 samples, including milk from all five dairies, and in numbers ranging from very few to 264,000 per cubic centimeter The milk-souring organism, *Streptococcus lacticus,* was not found Micrococci—mostly pyogenic staphylococci, the organisms which, when virulent, cause furuncles, abscesses, suppuration and septicemia — were found in 113, or 58 8 per cent, of the samples, and in numbers up to 80,000 per cubic centimeter Animal inoculations proved some of these to be virulent, the majority were nonvirulent Bacilli — chiefly of a type related to the bacillus of contagious abortion — were isolated from forty-five, or 23 4 per cent, of the whole number of samples, and in numbers as high as 50,000 per cubic centimeter One type, designated *B abortus var lipolyticus* because of its activity in decomposing butter fat, manifests its presence in the unpleasant flavor and odor of ripened cream Two other *B abortus* types resembled comparison cultures isolated from pathogenic sources The investigator points out that when organisms enter into the digestive tract with other food, the body tissues and fluids are protected by the mucous membranes against the ravages of the bacteria, and that therefore it cannot be assumed that bacteria which are pathogenic for inoculated animals would be injurious to human beings when thus taken into the body in milk Nevertheless, the fact that the bacteria which she found commonly present in milk from healthy udders were parasitic and, in some cases, virulent in type, should hasten the growing conviction that milk is certified only when it is pasteurized

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest, such as relate to society activities, new hospitals, education, public health, etc.)

DISTRICT OF COLUMBIA

Society News—At the twentieth annual meeting and banquet of the Washington Medical and Surgical Society held at the Hotel Raleigh, loving cups were presented to the secretary, Dr Walter Van Sweringen, and the treasurer, Dr Frank E Gibson, in appreciation of their work on behalf of the organization The address of the evening was made by Dr Edward Martin, Philadelphia, on "Psychologic Surgery"

Personal—Dr Harvey W Wiley, Washington, president of the United States Pharmacopeial Convention, gave a dinner to the trustees of the organization, May 5——Dr George M Kober, Washington, has been elected president of the Washington Sanitary Housing Company, and Mrs George M Sternberg has been elected a member of the board of directors to fill the vacancy caused by the death of her husband, General Sternberg——Dr Carroll E Bingman, Washington, has accepted a position with the First Aid Department of the American Red Cross

ILLINOIS

Physicians Vindicated—At the completion of the testimony for the plaintiff in the damage suit of $25,000 brought by Oscar Oserud against Drs Emanuel M Rundquist and C Olof H Nordwall for alleged malpractice in performing a surgical operation, Judge Frost on May 31 ordered the jury to bring in a verdict for the defendants, stating that the testimony had failed to substantiate the claim, that the physicians had erred in their conduct of the operation

Hospital News—The final campaign to raise a fund of $100,000 for the establishment of a nonsectarian hospital in Highland Park opened June 8, and it is announced that more than $60,000 has already been subscribed——*The Julia* Rackley Perry Memorial Hospital has been incorporated at Princeton, and Messrs H H Priestly, Cairo A Trimble and H U Bailey have been named as the first board of directors In the will of Mrs Perry $52,000 was devised for the building of the hospital, and the work of establishing the institution will be commenced without delay

Chicago

Women's Board at Hospital—Women interested in the Henrotin Memorial Hospital met at the residence of *Mrs* Edwin Ryerson, *June 4, to organize a woman's* board for the institution

Personal—Dr David O'Shea, who was recently seriously injured with a resulting traumatic pleurisy, has recovered and resumed practice——Dr Demetrius Staneff, who recently returned from service in the Balkans, gave a talk on the causes of the European War before the Hamilton Club, Brooklyn, May 31

Addition to Mercy Hospital—The new convent wing and addition to Mercy Hospital, which makes up the third unit of the new system, was opened to the public, June 15 The building corresponds in style to the two units previously built, has a frontage of *160* feet, and cost $275,000 The building will contain accommodations for sixty sisters and a hospital addition providing thirty private rooms and four private wards and a maternity department

Graduate Lectures at the College of Physicians and Surgeons—At the University of Illinois, College of *Medicine,* Chicago, during the graduate summer *quarter* (June 20-September 12), in addition to the scheduled courses, a series of lectures will be given before the faculty and students to which physicians and all others interested are especially invited The series will include *about* twenty lectures on special research topics *in* the preclinical sciences by men from various institutions throughout the country Detailed announcements of these lectures will be published from time to time The opening of the graduate quarter will occur, Ju[illegible] d the [illegible] e of the series will be given on [illegible] a [illegible] *rank Billings on* "The Relation [illegible] mental Sciences to Clinical [illegible] preside and will give an [illegible] Work in Medicine"

INDIANA

Tuberculosis Societies Hold Joint Meeting—At a joint meeting of the Indiana and Marion County societies for the prevention of tuberculosis held in Indianapolis May 24 a committee was appointed to study the bills which are to be presented before the 1917 legislature Drs Roscoe L Sensenich, South Bend, and Henry B Shacklett, New Albany are members of this committee, and Dr Alfred Henry, Indianapolis, is an ex officio member A resolution was adopted on the death of Dr William T S Dodds a pioneer antituberculosis worker of Indianapolis

Personal—Dr William T Gott Crawfordsville secretary of the State Board of Medical Registration and Examination has been reappointed a member of the board for a term expiring April 23 1920——Dr Joseph Rilus Eastman, Indianapolis, has been selected to take full charge of all hospital units of the American Physicians Expedition Committee in Austria Dr Eastman sailed for Europe, June 17 accompanied by a staff of fifteen assistants from Chicago and Milwaukee——Drs James J Stanton and Rodney E. Troutman Logansport, received slight injuries by the overturning of an automobile near Remington June 1——Dr Gustavus B Jackson has been reelected president, Dr Thomas B Eastman vice president, and Dr Herman G Morgan secretary of the Indianapolis Board of Health——Dr Charles W Shull, La Fayette, had a slight cerebral hemorrhage, May 31——Dr George H Brodbeck, Roann, was painfully injured in a collision between automobiles 10 miles north of Wabash

MARYLAND

Personal.—Dr N M Keith assistant to the director of the Brady Urological Clinic at Johns Hopkins Hospital is on duty in France with a section of the Harvard unit——Dr Caleb N Athey has been appointed chief police surgeon, and Drs William S Gilroy James M Craighill Elliott H Hutchins and Thomas P McCormick have been appointed police surgeons of Baltimore——Dr Ferdinand O W Reinhard, Baltimore, has returned after five months' Red Cross service in Serbia

Families to Report Diseases—Heads of families are to be held responsible by the health department for the reporting of contagious and infectious diseases in their homes, that are not reported by physicians This statement was made in the first of a series of health bulletins issued by the health department and written by Dr William T Howard Jr assistant commissioner of health Diseases that the law designates as reportable are smallpox, cholera yellow fever measles whooping cough pseudomembranous croup, scarlet fever diphtheria mumps varioloid typhoid fever tuberculosis chicken pox infantile paralysis epidemic cerebrospinal meningitis and affections of the eye.

MASSACHUSETTS

Personal.—Dr Rufus W Sprague has been appointed medical inspector of the health department, to succeed the late Dr Thomas H O Connor Dr Sprague has been medical examiner of the fire department for thirty-two years——Dr Lewis Fish district health officer for the state department of health at Fitchburg has resigned to devote his entire attention to private practice

Harvard Appointments—Dr George Richards Minot, who was awarded a James Jackson Cabot fellowship last year, will work at the Massachusetts General Hospital under the direction of Dr David L Edsall——Dr Lawson Gentry Lowrey who was also awarded a Cabot scholarship will pursue his research work at Danvers State Hospital, under the direction of Dr Elmer E Southard——The George Cheever Shattuck Memorial fellowship of $250 was given to Thomas F Wheedon Brookline, the Charles Elliott Ware memorial fellowship of $275 was awarded to James H Brown Jamaica Plain the research fellowship in genetics of the cancer commission of the university, was given to Clarence Cook Little——Dr Ernest G Martin has resigned as assistant professor of physiology

Hospital News—Burrage Hospital for Boys and Girls on Bumkin Island in Boston Harbor was opened for the season, June 9 Dr Philip A Shinn Boston, is resident physician and the institution opened with sixty sick children The hospital is H-shaped 175 feet by 153 feet two and three stories in height and fireproof——The Boston Floating Hospital will open this season on June 28 The medical corps will be in charge of Dr Henry I Bowditch and seventy nurses will be provided——The fourth annual conference on the medical and social work of the Psychopathic Hospital, Boston was held under the auspices of the trustees of the Boston State Hospital, June 10 Henry Lefavour, chairman of the board of trustees presided and six papers were presented during the afternoon

State Society Meeting—The one hundred and thirty-fifth annual meeting of the Massachusetts Medical Society was held June 6 and 7 in Boston under the presidency of Dr Charles F Withington, Boston At the meeting of the council, Dr Samuel B Woodward Worcester, was elected president Dr Fred W Taylor, Cambridge, vice president, and Dr Philemon E Truesdale, Fall River, orator On the morning of June 6, clinics were held at the various hospitals of the city and in the afternoon there were symposiums on diabetes, nephritis, fractures and tuberculosis On Tuesday evening the Shattuck lecture was delivered by Dr Theodore C Janeway, Baltimore, on 'The Etiology of Diseases of the Circulatory System" The annual discourse was delivered Wednesday by Dr David L Edsall Boston, and in the afternoon there was a symposium on "Goiter," and in the evening the annual dinner was served

MISSOURI

Personal—Dr Paul Paquin, director of health of Kansas City is reported to be critically ill with paralysis following an attack of meningitis——Dr Fabian L Pratt, Kansas City, who has been on duty for a year and a half in the French army has returned home on a six months' furlough——Dr Daniel R Hill Joplin has been appointed district physician for the Jasper County Public Health Committee

St. Louis

Personal—Dr Frederick Hagler, who recently returned after a year s service in Serbia sailed from New York on the steamer *Frederick VIII* for Germany He will work in connection with the American Physicians Expeditions Committee at a base hospital in Munich

Myer Memorial—The committee in charge of the collection of a fund for a memorial of the late Dr Jesse S Myer, and which decided on an addition to the library of the Medical Department of St Louis University, presented the memorial and a portrait of Dr Myer to the university, at the commencement exercises, June 3

Gift to Medical School—It is announced that at a recent meeting the General Education Board appropriated $250,000 for the Medical School of Washington University This makes a total of $1 000 000 which has been given to this medical school by the General Education Board towards a total of $1 500 000 for the purpose of placing the teaching of medicine surgery and pediatrics on the so-called full time basis

NEW YORK

Personal—Dr George P Paul, formerly of Round Lake, Boston has started for Trinidad in the service of the Rockefeller Foundation——Dr George E Blackham, Dunkirk, delivered the commencement address at St John's Military Academy Delafield Wis June 10——Dr Albertus L Fagan has been reappointed health officer of Herkimer for a term of four years

Dental Education in New York—Recent amendments have been made to the New York Public Health law relating to the practice of dentistry The principal change is the requirement of three years work in a registered medical school, or graduation before the student begins the dental course, which has been extended from three to four years For graduates in medicine, a special course of study covering two years in a registered dental school is demanded

New York City

Free Beds at Park Hospital.—The Park Hospital, 395 Central Park West, has available a number of free beds for the care of acute noncontagious cases among the worthy poor Admission will be made on application of the family physician and on presentation of a letter from the physician, containing diagnosis assurance that the case is a proper one for free hospital treatment

New Floating Hospital.—The new floating hospital of St. John s Guild the *Helen C Juilliard,* a model of its kind built and equipped at a cost of $125 000, was shown to the public at a reception given on board the vessel on the afternoon of June 7 The boat has a legal carrying capacity of 2,400 but it is proposed to limit the number to 1,800 in order to improve the service The boat is equipped to care for more serious cases than floating hospitals have been able to handle before and is fitted for service the year around

Personal—Dr Henry W Wandless has been appointed clinical professor of ophthalmology in the University and Bellevue Hospital Medical College——Dr Carroll Chase, Brooklyn, sailed for France on the *Chicago*, June 4 He will do hospital work under the auspices of the American Relief for France and her allies——Dr Bernath Weiss, Jamaica, sailed for Europe, May 29, on the *Nieuw Amsterdam*, and expects to join the sanitary corps of the Austrian army——Dr Harold Neuhof was awarded the Alumnus Association prize of $500, awarded biennially to an alumnus of the College of Physicians and Surgeons for the best medical essay submitted on any subject the writer may select——Dr Vera Dantaschakoff has been elected instructor in surgery at the College of Physicians and Surgeons, and Dr Rosalie Slaughter Morton, attending physician at the Vanderbilt Clinic This is the first time in the history of the college that instruction will be given by women lecturers

Typhoid Fever Among Hospital Employees—Two orderlies employed at St Mary's Hospital, Jamaica, have typhoid fever, a nurse is employed at Riverside Hospital who gives a history of having had typhoid fever some four months ago, and in addition there are several other cases of typhoid fever in the city hospitals In view of these facts the department of health has sent a letter to all the hospitals in New York calling attention to the unprepared condition of the hospitals, from a defensive point of view, as shown by the fact that several employees have contracted the disease from patients suffering from typhoid fever The department requests that an investigation be made of the previous histories of all employees coming into contact with patients in any way, whether or not they have typhoid fever, and that examinations of feces and urine be made to determine if they are carriers I is further urged that all employees be at once immunized against typhoid fever The necessary vaccine will be furnished gratis by the department

OHIO

Gorgas in Dayton—At the annual meeting and banquet of the Engineers Club of Dayton, May 31, Maj Gen William C Gorgas, Surgeon-General, U S Army, was the guest of honor His address detailed the benefits of sanitation and medical discovery in Cuba and Panama

Personal—Dr John C Reeve, Sr, Dayton, celebrated his ninetieth birthday anniversary, June 5, and was the guest of honor at a dinner given by the Medical Society of Dayton at the Dayton Club——Mr A G Lohmann, superintendent of the German Deaconess Hospital, has been elected president, and Dr Eli R Crew, superintendent of the Miami Valley Hospital, a member of the executive committee of the Ohio Hospital Association

Cincinnati

New Rule at General Hospital—It is announced that a rule is to be enforced that no physician or surgeon of the Cincinnati General Hospital can hold a similar position on the staff of any other hospital It is also proposed that a chief of service in each department shall be appointed who will be a whole time officer and be in supreme control of that department

Personal—Dr William Muhlberg, assistant medical director of the Union Central Life since 1907, has been elected medical director, succeeding the late Dr Clark Wasgatt *Davis*——Dr Walter H Stix has been appointed junior to the medical department of the Cincinnati Hospital, succeeding Dr Louis G Heyn, promoted to the senior staff——Dr Joseph Ransohoff has been appointed director general and Dr Nora Crotty, secretary, for the state of Ohio, of the National Society for the Control of Cancer——Dr Derrick T Vail has resigned as a member of the senior staff at the Cincinnati General Hospital after a service of fifteen years

The Drake Memorial—The memorial tablet of Dr Daniel Drake at the Cincinnati General Hospital, which was presented by Mrs Elizabeth Drake Morrill Edwards, great granddaughter of Dr Drake, was unveiled with impressive ceremonies, June 10 After introductory remarks by Mayor Puchta, Dr Joseph Ransohoff delivered an address on "Dr Daniel Drake, the Founder of Medical Education in Cincinnati" The tablet was then presented to the medical faculty of the University of Cincinnati by Mr Burgess Allison Edwards, son of the donor, and was accepted on behalf of the medical faculty by the dean, Dr Christian R Holmes The tablet was then unveiled by Elizabeth Drake Morrill, great, great granddaughter of Dr Drake The tablet is the work of Clement J Barnhorn and bears the legend "1785-1852, Creator of the Cincinnati Hospital and Ohio Medical College, Builder of Civilization in the Ohio and Mississippi Valleys, Daniel Drake, M D"

PENNSYLVANIA

Adopts Higher Requirement—An official communication from the Hahnemann Medical College of Philadelphia states that two years of college work will be required for admission to that institution for all students who matriculate in the session of 1917-1918 and thereafter

Personal—Dr Edgar M Green, Easton, has been appointed a member of the advisory board of the state department of health, succeeding the late Dr *George W Guthrie, Wilkes-Barre*——In the suit for damages for alleged malpractice against Dr James W G McLaughlin, Beaver Falls, by Ira L and Anna Clear, the jury brought in a verdict, May 31, in favor of the physician——Dr William S Wheeling, Spangler, chief surgeon of the Windber Hospital, is convalescent after a serious surgical operation

Philadelphia

Hospital Buys Building Site—The Rush Hospital for Consumptives at Thirty-Fourth Street and Lancaster Avenue has purchased a plot of ground 175 by 100 feet on Lancaster Avenue, east of Thirty-Fourth Street, adjoining the hospital building The site will be used for an addition to the buildings of the institution

Tablet Unveiled—At the annual commencement exercises of the Women's Medical College of Pennsylvania, May 31, the epitaph bas relief tablet, "The Woman Physician," was unveiled with appropriate ceremonies The tablet was presented by Dr Rosalie Slaughter Morton, New York, of the class of '97, and is the work of Miss Clara Hill

Completes Endowment Fund—Jefferson Medical College will take with it into the merger with the University of Pennsylvania an endowment fund of $200,000 A year ago Daniel Baugh promised to give the college $100,000 if a like sum should be subscribed by June 16, 1916 The last $1,400 of the sum was raised at the annual dinner of the Jefferson Alumni Association on the evening of June 2

Personal—Dr Albert P Brubaker received the honorary degree of Doctor of Laws at the graduating exercises of the Franklin and Marshall College, June 8——Dr R Tait McKenzie, head of the Physical Education Department of the University of Pennsylvania, who has been in the British service during the past year, will return and resume his duties at the university next September

Correction—In the issue of The Journal of the American Medical Association, May 27, p 1735, under the caption of "Scholarships and Loan Funds in Medical Schools," the Woman's Medical College, Philadelphia, is credited with just one scholarship During the session of 1915-1916, seventeen students were assisted to the following extent one student received $75, three, $100, one, $125, one $150, ten, $175, (full tuition), one, $250, total, seventeeen, $2,650

Public Health School—The merger of the Medical School of the University of Pennsylvania with the Medico-Chirurgical and Jefferson Medical Colleges may be the means of securing for this city a school of public health which the Rockefeller Foundation has signified its intention of placing in an Eastern university For several months a committee from the Rockefeller Foundation has been contemplating the University of Pennsylvania as a site for the school

Medical Club Holds Reception—The guests of honor at the reception of the Medical Club of Philadelphia held at the Bellevue Stratford, June 9, were Dr John B McAlister, Harrisburg, president of the Medical Society of the State of Pennsylvania, Dr Charles A E Codman, president-elect of the Medical Society of the State of Pennsylvania, Dr Alexander Marcy, Jr, Riverton, N J, representing the president of the Medical Society of New Jersey, and Dr George I McKelway, Dover, Del., president of the Delaware State Medical Society

Dr White's Benefactions—In addition to the bequests of $160,000 in the will of the late Dr J William White for the University of Pennsylvania and its hospital, the university has been bequeathed all medical pictures in Dr White's office and home the death mask of Dr D Hayes Agnew and the cast of his hand the medical faculty of the university is authorized to select from Dr White's library any books it may desire for the library of the medical school, and a fund of between $3 000 and $4 000 made up of gifts from patients is turned over to the University Hospital Charles S W Packard is named as trustee to succeed Dr White in a declaration of trust covering the Weightman donations of $50 000 and the residue of the estate is left in trust for the benefit of the widow and at her death $5 000 is to be paid to the University of Pennsylvania on condition that the trustees invest it for a period of one hundred years after Dr White's death At the end of this period the fund is to be added to the general endowment fund of the University Hospital

RHODE ISLAND

Mental Hygiene Society Organized—The Rhode Island Society for Mental Hygiene was organized and incorporated March 21 Its aims and purposes are to work for the conservation of mental health to assist in raising the standards of care and treatment for those individuals who suffer from or are in the danger of developing a mental disorder to study and assist in the proper care of the delinquent child one of the most important social and humanitarian problems to promote the study of feeblemindedness epilepsy and inebriety and to distribute knowledge concerning the causes, the treatment and prevention The officers are president Rathbone Gardner vice presidents W H P Faunce, and R H I Goddard, Jr treasurer Zechariah Chafee, executive committee, Dr G Alder Blumer Providence, Dr Arthur H Harrington Howard Dr Charles A McDonald Providence, Dr Arthur H Ruggles Providence Prof James Q Dealey, Judge Howard P Gorham and secretary, Dr Frederic J Farnell, Providence

New Officers for State Society—At the annual meeting of the Rhode Island Medical Society held in Providence June 1 the following officers were elected president, Dr Edmund D Chesebro Providence vice presidents Drs John Champlin, Westerly and Gardner T Swarts Providence secretary, Dr James W Leech Providence, and treasurer Dr Winthrop A. Risk, Providence. Dr William McDonald, Jr, Providence read a paper on The Light Under the Bushel" and Arthur L Hill, Boston made an address on Some Randon Thoughts on Law and Medicine. At the annual dinner Dr G Alder Blumer Providence, served as anniversary toastmaster The principal speaker of the evening was Dr Frederick M Allen of the Rockefeller Institute for Medical Research New York, whose subject was Diabetes ' The Fisk fund prize for the year was awarded to Dr Allen G Rice, Springfield, Mass., for his essay on The Value of Blood Pressure in the Diagnosis and Prognosis of Disease."

CANADA

Personal.—Dr Alex D W Kay resident physician at the Victoria Hospital, London Ont., has been appointed superintendent of St. Luke's Hospital Ottawa——Maj William E. Nelson, Westmount, Montreal has gone overseas and will be attached to one of the hospitals in France.——Dr Charles E. A. Trow Shakespeare, Ont., has joined the Canadian Army Medical Corps——Capt W Thomas B Edmison, Hastings Ont., is attached to the Ramsgate Military Hospital, Ramsgate. England——Dr David Donald Victoria B C., has returned from the front and is now attached to the Canadian Headquarters Staff London, England

Ontario Medical Association Meeting—The annual meeting of the Ontario Medical Association was held in Toronto, May 31 to June 2 Considering the fact of war time, the attendance of over 450 was very gratifying to the officers in charge. Dr Harry B Anderson Toronto presided. Referring to medical education in the province he advocated a strict uniform examination for the practice of medicine, and no granting of special privileges to those not properly trained. On organization of the medical profession, Dr Anderson stated there were now thirty-five local medical societies in the province ready to affiliate with the Ontario Medical Association. Dr Elliott P Joslin, Boston read a paper on the "Treatment of Diabetes Mellitus" Prof Alexander D Blackader Montreal, delivered an address on Drugs and Medicinal Agents" After the war he thought that the Canadian physician should favor the home-made or British made product, as certain lines of drugs commenced to be manufactured in Canada had proved eminently satisfactory The president stated after this paper had been discussed that the Dominion government had notified him that it purposed revising the "patent medicine" act and advised the association to make representations to the government along such lines The following committee was appointed to take charge of the matter Drs Robert D Rudolf, Charles P Lusk, John Ferguson, Toronto, James Third Kingston, Paul L Scott, Toronto and James H Mullin, Hamilton Prof Solomon Solis Cohen, Philadelphia, gave an address on "The Treatment of Pneumonia"

A very interesting and profitable demonstration of the use of moving pictures in showing the surgical technic as used in the New York Polyclinic was given by Drs John A Wyeth John A Bodine and Charles H Chetwood all of New York Dr Weston A Price, Cleveland introduced an intesting paper on Mouth Infections and Some of the Mechanisms by Which They Produced Localized and Systemic Diseases" Senator J S McLennan vice chairman of the Dominion Military Hospitals Commission, spoke at some length on the plans of the commission in dealing with invalided soldiers Drs George W Ross and Herbert K Detweiler Toronto, told how common 'colds' could be prevented by inoculation Their method consisted in the inoculation of a mixed vaccine prepared from the culture of different strains of organisms obtained from patients suffering from colds The following officers were elected president Dr A Dalton Smith, Mitchell, Ont, general secretary, Dr F Arnold Clarkson Toronto assistant secretary Dr Frederick C Harrison Toronto, and treasurer Dr Jabez H Elliott Toronto The social functions consisted of two garden parties one at Dentonia Park farm, and the other on the beautiful grounds of Sir John Eaton

GENERAL

Wine of Cardui Suit.—At the time of going to press the defendants—the American Medical Association—have presented evidence in surrebuttal and have closed their case On Tuesday June 13, Mr Hough attorney for the Chattanooga Medicine Co addressed the jury, opening the argument for the plaintiff On Wednesday Mr T J Scofield, attorney for the American Medical Association, presented the argument for the Association

Medical Men of District and Virginia Meet.—At the biennial session of the Medical Society of Northern Virginia and District of Columbia held at Herndon Va, June 2, the following officers were elected Dr Harry A Fowler, Washington president Dr Charles Franklin Russell, Herndon, and Llewellyn Powell Alexandria, Va., vice presidents, Dr Joseph D Rogers Washington, corresponding secretary, and Dr William I Robey, Herndon, treasurer

Divisions of Mental Hygiene and Rural Sanitation for Public Health Service—The House of Representatives, June 8 passed the bill to provide divisions of mental hygiene and rural sanitation in the Public Health Service The division of mental hygiene is to study and investigate mental disorders and their causes care and prevention The division of rural hygiene is to investigate improved methods of rural sanitation and the prevention and suppression of communicable diseases A similar bill is already pending on the Senate calendar

Military Training for Medical Men—Physicians and medical students will have an opportunity of receiving training at Fort Benjamin Harrison, Ind., where a military training camp will be opened July 5 Field Hospital No 1, under command of Maj William W Reno, M C., U S Army, has been ordered to Fort Benjamin Harrison from its station at Fort D A. Russell Wyo Ambulance Company No 1 also stationed at Fort D A. Russell will be at the camp in command of Capt. Condon C. McCornack, M C, U S Army All information regarding this camp may be obtained on application to headquarters Central Department, U S Army, Federal Building Chicago

Antinarcotic Law Construed—The United States Supreme Court June 5 affirmed the decision of the United States District Court in the case of the United States versus Jin Fuey Moy and decided that the words any person not registered as used in Section 8 of the law cannot be taken to mean any person in the United States but must be taken to refer to the class with which the statute undertakes to deal—the persons who are required to register by Section 1' Under this decision a person who does not import, produce, manufacture deal in, dispense, sell or distribute the drugs cannot be convicted of violating the Harrison Narcotic Law merely because he has some of the drugs in his possession

Is the Hot Springs Reservation a Park or a Sanatorium?—Representative Sherley of Kentucky has suggested that the Hot Springs Reservation, Ark, is a sanatorium rather than a park, and that it should therefore be under the supervision and control of the Public Health Service rather than of the Interior Department The suggestion was made in the course of a debate on a bill to authorize the Secretary of the Interior to furnish hot water from the hot springs, free of cost, to the Leo N Levi Memorial Hospital Association The bill had already been passed by the Senate and was passed by the House after a committee amendment had been added requiring the hospital association on request of the superintendent of the Hot Springs Reservation, to send an ambulance for and to accept and treat without charge therefor any emergency patient sent to the hospital for treatment The bill now goes back to the Senate for action with respect to the House amendment

Coca Cola Case Reversed by U S Supreme Court—For several years past the United States has been pursuing "Forty Barrels and Twenty Kegs of Coca Cola, The Coca Cola Company of Atlanta, Ga Claimant," through a libel for condemnation, in the federal courts The district judge directed a verdict in favor of the claimant, the Coca Cola Company, and judgment was entered accordingly The Circuit Court of Appeals affirmed the judgment and the case was then carried to the Supreme Court of the United States May 22, the Supreme Court reversed the judgment and remanded the cause for further proceedings in conformity with its opinion Mr Justice Hughes delivered the opinion of the court

In the prosecution of this case the government alleged in substance that Coca Cola was adulterated in that it contained an added deleterious ingredient, caffein, which might render the product injurious to health and that it was misbranded in that the name "Coca Cola" was a representation of the presence of coca and cola, whereas it contained no coca and little if any cola and was thus an imitation of these substances and sold under their distinctive name The Coca Cola Company admitted the presence of caffein but denied that it was an 'added" ingredient within the meaning of the law and that it was a poisonous or deleterious ingredient which might make the product injurious The company denied that there were substances known as coca and cola "under their own distinctive names" and averred that Coca Cola did contain certain elements derived from coca leaves and cola nuts

Whether caffein was or was not a poisonous or deleterious ingredient which might render Coca Cola injurious to health was not determined at any point in the case, since the courts below decided that it was not an "added" ingredient within the meaning of the law, thus sustaining the contention of the Coca Cola Company The contention of the company was based on the claim that Coca Cola was a compound, known and sold under its own distinctive name, of which caffein was a usual and normal ingredient, and that therefore caffein could not be an "added" ingredient The Supreme Court disposes of this contention in the following language

> "The fundamental contention of the claimant, as we have seen, is that a constituent of a food product having a distinctive name cannot be an 'added' ingredient In such case, the standard is said to be the food product itself which the name designates It must be, it is urged, this 'finished product' that is 'adulterated' In that view, there would seem to be no escape from the conclusion that however poisonous or deleterious the introduced ingredient might be, and however injurious its effect, if it be made a constituent of a product having its own distinctive name it is not within the provision If this were so, the statute would be reduced to an absurdity Manufacturers would be free, for example, to put arsenic or strychnin or other poisonous or deleterious ingredients with an unquestioned injurious effect into compound articles of food, provided the compound were made according to a formula and sold under some fanciful name which would be distinctive"

In the courts below the right of the Coca Cola Company to use the words "coca" and 'cola" for its product was sustained, irrespective of the presence or absence of either of the substances named, or of any product of either of them, on the ground that the name "Coca Cola" was a "distinctive" name and therefore within the protection of the proviso relating to articles sold under distinctive names The government contended that these words were descriptive, conveying to the purchaser the impression that the article contained coca and cola, that in so far as they were distinctive of anything they were distinctive of coca and cola, and that an article sold as "Coca Cola" that did not contain coca and cola was therefore misbranded On behalf of the company, it was claimed that while "coca" indicated one article and "cola" another, the two names taken together did not constitute the distinctive name of any other substance or combination of substances Of this the Supreme Court says, in part

> "To call a compound by a name descriptive of ingredients which are not present is not to give it 'its own distinctive name'—which distinguishes it from other compounds—but to give it the name of another compound"

This decision of the Supreme Court materially strengthens the hands of the government in its operations under the Food and Drugs Act.

FOREIGN

Identification Records of the Insane and Feebleminded in Spain—The province of Madrid is collecting finger-prints and other identification data of the inmates of all the asylums for the insane and feebleminded, etc

Deaths in the Profession Abroad—H G Blessing of Christiania who was physician and botanist to the Nansen polar expedition in the nineties——P Redard, medical superintendent of the Cannes health resort in France, and physician in chief to the state railroads——V Campenon, until recently professor agrege of clinical surgery at the University of Paris, aged 70

Physicians Elected Members of Spanish Legislature for Life—Our Madrid exchange, the *Siglo Medico,* congratulates the profession on the recent elections which have added materially to the number of physicians in the Spanish senate The Spanish universities are each entitled to a representative in the senate, and five have selected physicians for this position There are now sixteen medical senators, most of them *senadores vitalicios,* that is, electod for life Two of the latter, Cortezo and Pulido, are the editors and publishers of the *Siglo Medico* The list of life senators includes also Cajal, Morejon and Ocaña

WAR NOTES

French Hospital Needs Funds—An appeal for funds to be used in the maintenance of the Ris-Orangis Military Hospital, near Paris, of which Dr Joseph A Blake, formerly of New York, is the head, has been issued by Harold J Reckitt, the treasurer of the fund in this country It is estimated that $60,000 will be needed for the maintenance of the institution during the next twelve months

Contributions Gratefully Acknowledged—Receipt of the second contribution of $5,000, made by the American Red Cross toward the support of the International Prisoners Bureau in Geneva, has been acknowledged This bureau is conducted by the International Red Cross Committee as a clearing house of information between relatives of soldiers and sailors of all countries engaged in the war——A letter has been received from Henryk Sienkiewicz, president of the Polish War Committee, acknowledging the receipt of $8,000 transmitted by the American Red Cross for the relief of Polish war sufferers

LONDON LETTER

London, May 29, 1916

The War

THE WAR AND THE PROFESSION

At the general medical council the president, Sir Donald MacAlister, in his address reviewed the position of the profession with regard to the war He pointed out that the demands of the military and naval services continued to put a severe strain on the resources of the profession The central and local committees have been established to recruit for these demands, and at the same time to leave a fair provision for the medical needs of the civil population It was expected that in 1915, the first complete year since the war began the number of physicians added to the register, and available for military or civil work, would show a perceptible decrease This would probably have been so but for the decision to recall from the combatant ranks medical students of the senior years, and but for the establishment of reciprocity with the dominions and with Belgium In the result, the number of registrations in 1915 was 1 526, or 354 in excess of the average (1,172) for the preceding five years The question of maintaining, in this and in future years a supply of newly qualified physicians sufficient for the needs of the country, continues to engage attention The calling up of junior medical students, under the successive systems of recruiting, has given rise to some anxiety The number of students who during 1915 began medical study was 1 935 The number of first-year women students was 456—an enormous increase The number of second-year students was 1 020 The average annual entry of first-year students registered during the preceding five years was 1 441 In 1915 there were thus nearly 500 first-year medical students in excess of the average annual number registered in the preceding five years At the beginning of the present year the number of first-year students in actual attendance on instruction at medical schools (apart from teaching institutions) was 1 626 The expected depletion of students, as compared with normal years had thus been more than compensated by new entries and if things remained as they were the position four years hence would not be unsatisfactory It was thought advisable however to recommend that exemption from military service, already conceded to fourth-year and fifth-year students, should be extended to third-year students who showed their proficiency in the earlier subjects of the curriculum by passing a third-year professional examination at the end of the winter session An order to this effect was accordingly issued from the War Office

AMERICAN MEDICAL MISSION IN ENGLAND

A medical mission appointed by the United States government to study war conditions in Europe has arrived in England Its members are Colonel Bradley, Major Lyster and Major Ford of the United States Army, and Surgeon Pleadwell of the United States Navy They were entertained at dinner at the Athenaeum Club May 24 by Director-General of the Army Medical Service Sir Alfred Keogh and Sir William Osler when they had an opportunity of meeting a number of officers of the Royal Army Medical Corps the Canadian Army Medical Corps and the Medical Service of the Royal Navy The American ambassador was also present and paid a tribute to the work of the medical services of the United States Army and Navy in suppressing yellow fever and malaria and in bringing ankylostomiasis under control in Porto Rico and the Southern States The mission will begin by inspecting the system of treating the sick and wounded in this country and then go to France to study the hospitals and medical arrangements

The Suitability of the White Man for the Tropics

At a meeting of the British Science Guild Mr Andrew Fisher high commissioner for Australia delivered a remarkable address in which he described the operations of the Institute of Tropical Medicine in Queensland part of whose investigations related to the effect of climatic conditions As far as their statistics guided them he said it would appear that Europeans had a better chance of life in the tropical portions of Australia than in the temperate zone of that continent. It was remarkable as the latest figures showed that Queensland largely a tropical state had at once the highest birth rate and the lowest infantile death rate in Australia This was a matter of worldwide importance It was an interesting human experiment confined not merely to a selected locality but applied to a country three times as large as the United Kingdom It was also of vital interest to Australia for it was hoped that it would decide the question of climatic influence on the white man in the tropics the maintenance of whom was a principle to which Australia has pinned her faith as a nation

PARIS LETTER

Paris, May 25, 1916

The War

THE MEDICAL RECORDS OF THE WAR

M Justin Godart, undersecretary of state for the medical service of the army, has just decided to collect the medical archives of the war at the Military School of Practical Medicine and Pharmacy at Val-de-Grace The object is not merely to put on record the activities of the medical service but also and more especially, to communicate the lessons of the war immediately to practitioners For this purpose military surgeons have been requested to send at once to Val-de-Grace all documents and exhibits of interest. The matter so collected will be divided into three categories (1) exhibits (2) archives and (3) library The exhibits will deal with the general organization of the material of the medical service at the front and in the interior of the country (models of full or reduced size, of transports and hospital material), hygiene and epidemiology (models of sanitary installation), military surgery (weapons projectiles and their relation to wounds), instruments and apparatus of all kinds (surgery, radiology, physiotherapy, and mechanotherapy), prostheses and casts, anatomic specimens, chemistry and pharmacy (asphyxiating gases, etc.) In the archives will be assembled instructions and circulars of the heads of the medical service The papers of the sanitary formations (these will be deposited after the end of the war), reports of specialists, reports explaining the exhibits, graphs, diagrams, drawings and photographs of all kinds relating to the organization of the service (photographs of sanitary formations transports and hospitals, hygienic installations, etc), as well as the material for the anecdotic history of the service in the field The library will contain books concerning the medical service as well as reprints from the medical publications relating to the war

ANTITETANIC SEROTHERAPY AND ANAPHYLAXIS

At the Reunion medico-chirurgicale de la V-e armee, Dr. Genouville described five cases in which he employed, with antianaphylactic precautions, the injection of antitetanic serum in cases of wounded men who had already received an injection of this serum for previous wounds First the injection of 1 c c was given very slowly in a vein of the elbow, and a few minutes later an injection of 10 c.c hypodermically The only phenomena noted were a slight serous eruption in one, a transient fever in another, a third person, a few minutes after an intravenous injection, developed a cough and slight faintness which lasted a quarter of an hour This man had received a wound of the thigh from a fragment of shell two days before He had breathed tear-producing gases and showed signs of bronchitis The subcutaneous injection was postponed until the next day, and produced no inconvenience It is fair to ask oneself in this case, whether the inhalation of the gases had not some causal relation with the phenomena observed At any rate, these new observations show that if appropriate antianaphylactic precautions are taken, one can without danger practice antitetanic injections on every wounded soldier even if he has received an injection of the same serum several months before

Dr Duperie remarked that there was no theoretical reason why the irritation of the respiratory apparatus by asphyxiating gases should be regarded as a contraindication to antitetanic serotherapy The irritation even generalized, of the broncho alveolar structures does not seem to produce a condition of anaphylaxis in the same way that infectious diseases do when there is pulmonary localization such as tuberculosis and its larval form asthma There is however, some fear that a second injection of serum in those who are suffering from gassing' may provoke serious symptoms owing to the congestion of the pulmonary system, as a result of asphyxiation In this case one is justified in guarding against anaphylaxis by using Besredka's method On the other hand, the mildness of the immense majority of anaphylactic incidents which occur after the second hypodermic injection of serum seems to justify in the present circumstances and in ordinary cases the omission of Besredka's precautions This, however is not true for reinjections given intravenously or intraspinally The severity of the anaphylactic symptoms in these conditions calls for the greatest prudence

NONMAGNETIC STEEL INSTRUMENTS

Dr Bergonie professor of biologic physics and medical electricity at the Faculte de medecine of Bordeaux, has presented to the Societe de chirurgie de Paris instruments in appearance similar to those in daily use but which have the peculiarity that they do not start vibrating in the neighborhood of electromagnets This property allows of their use in the extraction of projectiles by means of Bergonie's electrovibrator It was indeed one inconvenience of Bergonie's method that during the exploration in this operation, it was necessary to put aside forceps and so to deprive oneself of the aid of separating the lips of the wound because even any nonmagnetic substances such as copper and silver will vibrate and cause error Bergonie has used a new metal which is not affected either by attraction or vibration caused by electrovibrators This metal is a steel alloy

Death of Dr Assicot

The death is announced of Dr Assicot, intern of the Paris hospitals and of the ophthalmologic clinic of the Faculte He had been professor of clinical ophthalmology of the school of medicine at Rennes since 1907 After serving through the first part of the campaign he was appointed chief of the ophthalmologic center at Saint-Malo From there he was sent as battalion surgeon to Verdun, and was killed at his post four days after his arrival at the front

(Continued on page 2000)

PROCEEDINGS OF THE DETROIT SESSION

MINUTES OF THE SIXTY-SEVENTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT DETROIT, MICH, JUNE 12 16, 1916

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 12

[NOTE—Practically all of the minutes as they appear this week are the official reports of committees as originally prepared and appearing in the Handbook of the House of Delegates During their presentation slight additions were made which are noted as addenda at the end of the report of the first session]

The House of Delegates met in the auditorium of the Wayne County Medical Society Building, and was called to order at 10 15 a m by the President, Dr Albert Vander Veer, Albany, N Y

Dr D Chester Brown, Connecticut, chairman, reported that the Committee on Credentials had examined and approved the credentials of delegates which conformed with the rules of the House One hundred and ten delegates were seated The President thereupon declared the House duly organized

The Secretary called the roll and announced a quorum present

The next in order were the presentation, correction and adoption of the minutes of the sixty-sixth annual session, held at San Francisco

The Secretary stated that the proceedings of the House of Delegates of the sixty-sixth annual session, held at San Francisco, had been published and a copy sent to each member of the House of Delegates There were but two suggestions made in the way of correction of the minutes, one of which was received from an Eastern state, and the other from a Southwestern state, asking the Secretary why the record of the executive session of the House of Delegates had not been incorporated in the official minutes as published The Secretary stated that the record of this executive session was *not incorporated in the minutes* because in accordance with usage and custom, minutes of such executive sessions were treated as is a committee of the whole

The Secretary further stated that the Judicial Council in presenting that section of its report dealt with the discipline of members, adding to the published report the names of those disciplined

Dr Edward Guion, New Jersey, moved the adoption of the minutes of the San Francisco session as printed Seconded

Dr Herbert B Gibby, Pennsylvania, moved as an amendment that the minutes of the sixty-sixth annual session be corrected so as to include other minutes of the executive session Seconded

Dr Guion having withdrawn his motion, the motion of Dr Gibby was put and carried

Dr Guion moved that the minutes as printed and corrected be approved

Seconded and carried

Address by the President, Dr Albert Vander Veer

Reports of officers being the next order, President Vander Veer delivered the following address, which was referred to the Reference Committee on Reports of Officers

President's Address

To the Members of the House of Delegates of the American Medical Association

I approach the duties of today with great sorrow Our late President, Dr Rodman, was a dear friend of mine, and the news of his death, while he was engaged in the activities of his professional responsibilities, was a shock to us all Let us perpetuate his memory through our earnest desire to continue his labors, without their excellence

Obituary notices have been presented to THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, and to his bereaved family we can only express our deep sympathy

If one reads with care the necrology list of the past year, in THE JOURNAL, it is exceedingly impressive In addition to President William L Rodman, Fellows like Samuel B Ward, Wisner R Townsend and Henry L Elsner of New York State, Henry B Favill of Illinois, Frank J Lutz of Missouri, and many others will be greatly missed "Lest we forget," may the heritage of their "work well done" be an incentive to those of us yet remaining

While not taking too much of your time, let me bring before you some of the important questions which, to me, seem worthy of your consideration

MEDICAL LAWS

Members of such a representative body as this House of Delegates should ever be on the alert favoring good, and opposing evil laws, and it would seem that, in consultation and discussion with each other, it is possible for us to succeed in framing such acts as are best suited to meet the conditions existing in each particular state

The consolidation of medical colleges, the requirements in preparation, exacted from the medical student, and limited enrolment, while all tending to increase the efficiency of the graduate, must also necessarily lessen their numbers

It would seem proper for our educators to move somewhat cautiously in too severely limiting our output of physicians At the present time, there is quite a demand for a good, reliable doctor, at many of the so-called country crossroads

Dr Horner, in charge of the Department of Professional Examinations, Education Department of New York State, informs me that a recent amendment to the public health law of New York relates to the legal requirements of the beginning of medical study It does not materially advance the present requirements, but places in the hands of the Board of Regents of the University of the State of New York the power to do as they deem proper from time to time This *act of the legislature will place* the state of New York on the same plane as high as any other in the Union

It must be a great source of comfort to our President Elect to note how rapidly the quarantine stations of our larger cities are coming under government control Very recently *Governor Whitman* signed the bill placing the port of New York under United States super*vision* All of this means harmony of action in preventing the entrance and spread of diseases of a contagious and infectious nature Only recently has the legislature of the state of New York enacted laws permitting the state board of health to enforce its *rule* regarding vital statistics, especially in births and deaths

MEDICAL INSPECTION *IN SCHOOLS*

Two years ago the legislature of the state of New York passed a law appointing a *state medical* inspector of school

Dr Finegan, our assistant commissioner of education, has tabulated much of the work accomplished by *medical* inspection, at various times, and finds that over 90 per cent of the schoolchildren are physically deficient in some form or another, that is, enlarged tonsils, adenoids and such various conditions as are incident to early childhood, but this is also to be observed, that in cities in which medical inspection has been going on for a few years there is a much smaller percentage of these children than in the rural districts where inspection is not yet made so thorough

In a recent letter from Dr Howe, the inspector, he makes the following statement

"It is indeed gratifying to know the material progress being made in many sections in medical inspection in schools

"More than one half of our states now recognize its great value and have provided for its enforcement by statutory measures while most cities are conducting a systematic plan to better conserve the health of the schoolchild This health service is really at the foundation of true preparedness of our country as without strong bodies little could be accomplished in national strength

"Closely allied to this special feature of educational work —for it is largely educational and made possible by its success—we find physical education and physical training provided for by the legislature of the state of New York

As a medical profession we will I am sure, welcome the opportunity to lend our united influence to the upbuilding of any system having for its sublime purpose the welfare of the children of our country"

INDUSTRIAL DISEASES

This new classification, or addition to our previous nomenclature should receive more serious consideration

In this connection our laws relating to workmen's compensation—the subject that is now so prominently presented —should receive greater attention from the medical profession This duty is plainly manifest in the administration and settlement of claims Much thought is also now being given to the investigation of health insurance

TRUDEAU SCHOOL OF TUBERCULOSIS, SARANAC LAKE, N Y

This institution promises to be one of the most important that has yet been organized for the study and treatment of tuberculosis It was opened May 17 1916, its object being to give instruction to graduates and students who are desirous of understanding more thoroughly the treatment of all forms of tuberculosis Among its teachers are some of the most eminent men in America It was organized as a memorial to Dr E L Trudeau It was proposed to raise the sum of $500,000 as an endowment, and this amount is nearly completed the income of which is to be used for conducting the school The announcement and circular give an exceedingly complete outline of the work intended and the encouragement already given

An additional factor in medical education is presented in a summer school, in connection with the Rome Custodial Asylum for teaching special classes in the public schools and institutions for the feebleminded Dr Bernstein, the superintendent, will be pleased to give full details regarding this work

I should be pleased to have these few remarks received as suggestions that as soon as the delegates from the different states and the sections forming the American Medical Association are appointed they meet as separate bodies prepare a report regarding the work accomplished in their particular territory, and send this to the President of the Association for his consideration, he to report on it to the House of Delegates

PREPAREDNESS

How much is implied by this term at the present time! Patriotism defines the situation exceedingly well, and is to be noticed in the parades of citizens in our cities, and the efforts that are being completed for observance of Flag Day in so many of our states Business and professional men in every walk of life have united with an earnestness most impressive My vivid personal remembrances of our unpreparedness in the beginning of our Civil War, and what has been told me by my late associate, Dr Macdonald, and my son Dr Edgar A Vander Veer regarding the unpreparedness they had to contend with as medical officers in the Spanish-American War lead me to call your attention to the situation as it exists today of that exceedingly important aid to our government, in time of distress, namely, the medical profession of this country Surgeon-General Gorgas is thoroughly alert, and his strong stand in his strong position has been of great help to Congress in framing suitable legislation

The American Medical Association has a strong organization in connection with Red Cross work

As will be noted by the report of the Committee on Red Cross Work presented at this meeting the committee is thoroughly alive to the situation and when once it is indicated what the classification of the work is that is required from the medical profession, the machinery will be started with no doubt, excellent results following

During the fall of 1915 the Clinical Club of Albany, composed of about fourteen of the younger men in the profession discussed the situation, and by December had formulated a plan which they considered of sufficient importance to present to the Surgeon-General's Office This outline has been much admired and discussed by those in authority in the surgeon-general's department, and it seems very proper to present the following editorial entitled "The Albany Idea" which appeared in the June, 1916, number of the *Military Surgeon*

"A very practical method of instruction in the methods and purposes of medical preparedness is being employed by the Clinical Club of Albany N Y There is first a preliminary course, by reading lectures and discussions on the various subjects necessary to the training of medical reserve officers To facilitate this work, typewritten pamphlets, which are brief digests of the subjects of which they treat, are prepared and distributed among members to be read at leisure For example, one on organization has already been issued, and others on the duties of medical officers, etc., are nearly finished

"The club then proceeds to the solution of definite problems such as might reasonably arise in war, are of local importance and are within such limitations as could be expected in actual service It is assumed, for example, that both New York and Boston have been occupied by the enemy and that our forces are retiring from these points slowly and in good order, toward Albany in the vicinity of which a strong defense is planned An hypothetical enemy sympathizer is detected contaminating the local water supply —and the club sets itself the task of determining the nature and degree of contamination and restoring purity The assumption is made that Albany is suddenly called upon to care for 100 000 refugees from New England and Southern New York largely destitute women and children—and the club works out the local resources probably available for the food shelter and care of such persons Engagements resulting in 100 000 wounded in the course of a few days from actions near Hudson N Y and Pittsfield Mass are assumed, and the club, dividing itself into committees ascertains the local resources available to assist in their care, including transportation medicines, dressings operating and hospital facilities, antitoxins and vaccines food clothing milk nurses beds and bedding buildings especially suited to hospital purposes, etc All these main subjects are further gone into under many subheads, and the study is carried out with much detail and thoroughness For example, the milk question alone is handled under fourteen subheads

"This is the kind of practical study which we want It not only visualizes the problem but gives it a local color which cannot fail to add greatly to its interest Whether war conditions would create exactly such a problem as is assumed is of no importance It serves its purpose if it shows the need of preparedness, if it demonstrates the importance of cooperation, if it trains the mind not only to conceive of the various difficulties which may arise but to progress in logical way to their solution Solving one problem makes the next easier Solving them in theory in time of peace facilitates their solution in reality in time of war

"A great thing is to accustom one's self to new ideas and unfamiliar mental processes Another most valuable result in this connection is the working out of methods and the enumeration of local resources—in which it is safe to say that many surprises would develop

"The plan contemplates the institution of like inquiry to that begun in Albany throughout the country If it were carried out generally and a summary of the results turned in to the government these would constitute a mass of information which would be very instructive and valuable If Medical Reserve Corps divisions generally would set themselves to finding out what part their communities were prepared to render in war, and if general medical societies would—say twice a year, devote an evening to the discussion of such subjects, it would be a long step in preparedness and patriotism We earnestly commend this matter to their attention"

At the last meeting of the Clinical Congress of Surgeons of America in a general way there was much discussion relative to the efficiency of our medical preparedness in case of any complication that might arise About this time the government appointed an advisory committee of its most prominent citizens as consultants on various industrial subjects

Later, when need for prompt action seemed urgent, I was asked as President of the American Medical Association to cooperate with the presidents of the Congress of American Physicians and Surgeons, the Clinical Congress of Surgeons of North America, and of the American College of Surgeons in appointing a strong committee of American physicians for the purpose of considering plans for civilian medical preparedness At that time, the following communication was sent to those selected

"Dear Doctor

"In view of the fact that the work of this committee may meet any possible military emergency that may arise the presidents of the American Medical Association, the Congress of American Physicians and Surgeons, the Clinical Congress of Surgeons of North America and of the American College of Surgeons have thought it wise to appoint a representative ad interim committee to tender the good offices of the medical profession to the War Department

"In view of the fact that the work of this committee may assume official form, it is important that no phase of the subject may become known before it reaches the hands of the president

"Very sincerely,

"Albert Vander Veer,
"William S Thayer,
"Fred B Lund,
"J M T Finney

"April 9, 1916"

A brief outline of some phases of the subject which will come up for consideration follows

1 To provide a carefully selected list of highly efficient men, especially in the essential lines of work as follows

(*a*) A body of men whose training and experience would fit them peculiarly for sanitary work, etc (*b*) A group whose training, experience and life's work show them to be especially equipped for duty in the line of internal medicine (*c*) A list of men whose surgical training, experience and practical results show them to be eminently qualified for surgical work

2 In addition to the foregoing, the committee could classify its lists according to age, etc, thereby aiding in the selection of civilians suitable for military duty at the front and at base hospitals, make a classification of hospitals, their capacity and efficiency, and aid in developing at as many hospitals as seems advisable, units composed of surgeons, internists, assistants, nurses, orderlies and others, with drills, suitable to military requirements (Motion pictures of such work would materially aid civilian units in learning military necessities)

3 The committee could urge the great technical advantage of having trained medical, surgical and sanitary observers at every military and naval front and at base hospitals for the purpose of noting and reporting to the United States government the actual advances and deficiencies daily arising in the management of those most important features of warfare the prevention of outbreaks of disease, the best handling of the wounded, the prompt healing of wounds, the conservation of limbs, etc, and the prompt return of fighting men to the front It seems that in view of potent possibilities now so apparent, this field of preparedness—the humanizing life-saving feature—should keep pace with the plans for destruction If we should become entangled in a serious conflict, the one certain thing is that our men as well as those of our adversaries will be wounded in large numbers The prevention of disease and the proper care of the sick and wounded will have much to do with the outcome

In addition to the evident advantages of systematic preparation, two practical facts seem apparent In the first place if the committees from the medical profession are working in harmony with the committee on industrial preparedness (composed of representatives of the American societies of civil engineers, of mechanical engineers and of mining engineers and of the American Chemical Society) during times of peace, their mutual needs will be fully understood and can be accomplished with a minimum of friction and waste of energy Secondly, such a critical classification of civilian positions, according to their individual efficiency would materially aid in assimilating any volunteer army with a maximum of speed and efficiency

Following this, a meeting was held at the Union League Club, Chicago, April 14, 1916 The meeting was called to order, and Dr J M T Finney was chosen as temporary chairman Dr Frank F Simpson was chosen as temporary secretary The object of the meeting was stated and approved, and a permanent organization was then perfected by the election of the following officers chairman, Dr William J Mayo, secretary and treasurer, Dr Frank F Simpson, executive committee, the officers, and Dr Albert Vander Veer, Dr William S Thayer, Dr Fred B Lund, Dr J M T Finney, Dr Franklin H Martin, Dr George W Crile, Dr George E Brewer and Dr Robert G LeConte.

On motion, duly carried, the executive committee was requested to confer with the authorities at Washington regarding the advisability of the general plan as outlined in the call for the meeting to formulate such plans as may be deemed advisable after a conference and to call a meeting of the whole committee in the near future, probably at Washington, D C And the following is the list of names of those to whom the foregoing communication was sent Frank Billings, John F Binnie, Joseph C Bloodgood, George Emerson Brewer, George W Crile, George E De Schweinitz, J M T Finney, Charles Gibson, Fred Bates Lund, Edward Martin Franklin H Martin, Rudolph Matas, W J Mayo Charles H Mayo John B Murphy Lewis S McMurtry Albert J Ochsner Charles Allen Porter, Charles A L Reed Emmett Rixford Hubert A Royster F F Simpson Richard P Strong William S Thayer and Albert Vander Veer And there was also appointed an auxiliary committee

April 26, the executive committee conferred with the president of the United States They called attention to the fact that in times of peace as well as in time of war the medical profession has always held itself in readiness out of a spirit of patriotism to serve the best interests of the government, that the European war has demonstrated the greater need for medical men and supplies than formerly was thought adequate or necessary, and lines of service which the civilian medical profession might render were indicated The president expressed himself as being much pleased with the patriotic action of the medical profession and assured the committee that the government would avail itself of the services tendered

Late in April a number of conferences were held with Col J R Kean Director-General of Military Relief for the American Red Cross

The question of cooperation between the committee of American physicians (on preparedness) and the Red Cross was considered carefully by the executive committee at its meeting in Washington May 8 The conclusion reached was that while it is best for the two organizations to maintain their separate identity and to pursue their separate purposes diligently hearty cooperation between the two organizations will result in their mutual advantage and in furthering their common cause To that end, the Red Cross has appointed all the members of the National Committee to membership in the National Committee on Red Cross Medical Service, and Colonel Kean has been appointed an Associate Member of our National Committee

As the following letter from Colonel Kean explains

"May 31 1916

Dr Albert Vander Veer, 28 Eagle Street Albany N Y

Dear Sir

"The Executive Committee of the American Red Cross at its meeting, May 26 1916 appointed you a member of the National Committee on Red Cross Medical Service. This committee consists of thirty-six appointed and ten ex officio members It includes in its membership all the members of the Advisory Committee of Civilian Physicians and Surgeons on Medical Preparedness'—it having been decided on consultation with the executive committee of that advisory committee, that in this way could be best secured the objects which the American Red Cross and the advisory committee have in common and have determined to work for in unison

As a member of this committee you will be asked to advise with the Department of Military Relief of the American Red Cross in the selection of physicians and surgeons for Red Cross organizations and in the enrolment of the profession

"It is requested that you advise this office of your acceptance of this appointment

Very respectfully

"J R. Kean,
"Colonel Medical Corps U S Army
Director General of Military Relief

One element of great importance is the working out of the units forming base hospitals

Fourth Base Hospital Unit Already New York City is thoroughly alive to the situation, public-spirited citizens having furnished the necessary funds for a completely equipped base hospital of 500 beds This was given to the New York County Chapter of the American Red Cross by Mr and Mrs George Blumenthal of that city This unit will cost $24 000, and will be organized in connection with Mount Sinai Hospital The staff will be recruited from the surgeons and nurses of the institution, and will consist of twenty surgeons, forty-six nurses and 125 orderlies Mobilization plans of three units are ready for service, either in the field in time of war, or in the case of extreme emergency at the scene of a great disaster

Reference Committees

At the conclusion of his address, the President announced the appointment of the following reference committees

RULES AND ORDER OF BUSINESS

Dwight H Murray Chairman	Syracuse N Y
G Wythe Cool	Washington D C
Sol G Kahn	Salt Lake City
Jere L Crook	Jackson, Tenn
S D Swope	Deming N M

MEDICAL EDUCATION

L. W Littig Chairman	Davenport Iowa
A H Levings	Milwaukee Wis
William H Seaman	New Orleans
Hugh Mackechnie	Chicago
William S Lalor	Trenton, N J

LEGISLATION AND POLITICAL ACTION

E J Goodwin Chairman	St. Louis
H R McGraw	Denver
F L. Van Sickle	Olyphant Pa
C P Meriweather	Little Rock Ark
Charles W Hannaford	Portsmouth, N H

HYGIENE AND PUBLIC HEALTH

A T McCormack Chairman	Bowling Green Ky
John W Kerr	Washington D C
Eugene R. Kelly	Boston
W S Sawhill	Concordia Kan
John A. Ferrell	North Carolina

CONSTITUTION AND BY LAWS

Floyd M Crandall Chairman	New York
E A Hines	Seneca S C
Jefferson R. Kean	U S Army
C L Stevens	Athens Pa
J J McLoone	Phoenix Ariz.

REPORT OF OFFICERS

A R. Mitchell Chairman	Lincoln Neb
E R. Stitt	U S Navy Washington D C
W E Anderson	Farmville, Va.
B R. McClellan	Xenia Ohio
John O Polak	Brooklyn

CREDENTIALS

D Chester Brown Chairman	Danbury Conn
W A. Coventry	Duluth Minn
J H. J Upham	Columbus Ohio
H. E Randall	Flint Mich
H. P Newman	San Diego Cal.

MISCELLANEOUS BUSINESS

L. J Hirschman Chairman	Detroit
Dean D Lewis	Chicago
Floyd W McRae	Atlanta Ga.
Don Palmer	Seattle Wash
A. E. Bulson Jr	Fort Wayne Ind

The President announced the following Committee on Awards for Scientific Exhibit John B Blake Boston, Chairman, W T Williamson, Portland, Ore., Harlow Brooks New York.

Reports of Officers

Report of the Secretary

The Secretary presented the following report, which was referred to the Reference Committee on Reports of Officers

To the Members of the House of Delegates of the American Medical Association

For the year 1915-1916, I submit the following report

ORGANIZATION OF CONSTITUENT ASSOCIATIONS

* Not including Fellows of American Medical Association

Note —The number of members of the different associations stated in this table is in accord with the membership of the several associations as they were reported to the Secretary on May 1 1916 The lack of an effective uniform system for reporting the membership of the state associations accounts for whatever discrepancies this table shows and detracts from the value of the statement

Component societies are those societies which compose the state association A component society may include one county or more

[1] The state of Maryland has 23 counties and the city of Baltimore, Missouri has 114 counties and the city of St Louis

[2] These state associations are divided into district societies and these are listed in the table as component societies Some of these districts are smaller and some larger than the county, the county lines being ignored

[3] Provision is made for the physicians in each of these counties to join the component society in an adjoining county

[4] Virginia has recently adopted the plan of organization and is now establishing component county medical societies

MEMBERSHIP

The membership of the various constituent state associations, which constitutes the membership of the Association according to the records in the Secretary's office, May 1, 1916, is shown in the following table

FELLOWSHIP

The Fellowship of the American Medical Association on May 1, 1915, was 42,366 During the past year, 441 Fellows have died, 1,540 have resigned, 713 have been dropped as not eligible, 658 have been dropped for nonpayment of dues and 17 have been removed from the rolls on account of being reported "not found," making a total of 3,369 names to be deducted from the Fellowship roll There have been added 4,184 names to the Fellowship roll, of which 3,293 were transferred from the subscription list The Fellowship of the American Medical Association on May 1, 1916, was 43,181, a net increase for the year of 815

This gain in the number of Fellows is due largely, as in previous years, to circularizing subscribers to The Journal who were eligible, urging them to become Fellows

It becomes necessary to report that the Wyoming State Medical Society is *no longer active* No meeting of this constituent state association has been reported for the past three years and a number of Fellows who hold their Fellowship through membership in other constituent state associations and who have moved to Wyoming, write that they have not been able to obtain membership in the constituent association of that state A number of letters addressed to the secretary of this constituent association have *not* been answered

This state of affairs in the organization in Wyoming prompts the suggestion that the House of Delegates refer to the Judicial Council the question of whether or not a more compact organization than that at present defined in Art IV of the Constitution is advisable, and that the Judicial Council, if it determines a closer affiliation is wise, be instructed to take up the question with the constituent associations It is suggested, further, that the status of the Wyoming State Medical Society be referred to the Judicial Council with power, at the discretion of this Council, to revive the present organization or to arrange for a new organization of the profession in Wyoming to become the constituent association of the American Medical Association from that state.

Other matters in which the office of the Secretary of the Association has been concerned are reported to the House of Delegates from other sources

Respectfully submitted

Alexander R Craig,
Secretary

Report of the Board of Trustees

Dr W T Councilman, *Chairman, read the following report* which was referred to the Reference Committee on Reports of Officers

To the Members of the House of Delegates of the American Medical Association

During the past year the many activities of the Association have been followed with the usual diligence and with good results Full reports of all these you will hear through the chairmen of the various councils Considering the work of the Association as a whole, what it has accomplished in the past and the promise of the future, one is filled with a sense of pride in being a member of the body This work, while of benefit to the medical profession, extends much wider than this and benefits the nation It is only by means of the organization of the profession, so that its combined force is at the back of these reforms, that this work is possible. The reforms that have been brought about—notably that of medical education—have come slowly, thus producing no violent disturbances The manner of procedure has been to acquire full and accurate information of the subjects in hand, to give out this information, and with this as a basis to proceed. By the reports of chairmen the members are kept fully informed as to details as the work progresses. These reports form valuable contributions to knowledge on the subjects considered. In any review of the progress of education in this country the reports of the Council on Medical Education and the various subsidiary papers and reports proceeding from this must be considered. The same is true of the work of the other councils, particularly that on Health and Public Instruction and that of the Judicial Council. The reports of the chairman of the latter are valuable studies of the relation of the profession to the social state. This relation, which must become ever more important with the advance in social organization, has been fully recognized by your trustees who this year have granted a considerable sum of money which will be expended mainly in acquiring information.

We are entering on a period of great changes in social organization, a period which will necessitate a far closer organization of the people in all forms of activity, and this particularly calls for united strength in opposing disease. It is true we have not so strongly felt the necessity for this as have other nations, but the time has come when we can no longer resist the social movement, and it is better that we should initiate the necessary changes than have them forced on us. On such information laws regulating social medicine which will be just both to the medical profession and to the public, whom it serves, must be based. All of our councils have worked in perfect harmony with other bodies, often outside of the profession, which have had the common good in mind.

The great agent by which all this has been accomplished is our journal. It has furnished the material means, it is the bond of union. Not only this but medical men cannot afford to be ignorant of the information it conveys. The careful reading of THE JOURNAL will keep a man fully informed of the advance in medical knowledge and give him the stimulus which comes from the relation of research. THE JOURNAL is today the most valuable medical journal in the world and a profession which it fully represents must be on a high plane. Throughout the entire field of medicine it has been a leader and not a follower. No one can have a prouder monument than this journal will give to the man who has for so many years directed it and under whose fostering care and high ideals it has become what it now is. The Association, as the need for them arose, has also undertaken the publication of journals devoted to more special branches of medicine. These also have been successful and fulfil a useful purpose.

In considering the work of the Association, may we not say that it has accomplished a still higher task, that of uniting the medical profession? There has never been a time when it has been so free from faction. And the great idea on which this unity is based is that of service. No ignoble aim could have accomplished it, and the ideal of service is evident in all the activities of the medical profession as represented by this Association.

PUBLICATIONS

THE JOURNAL

The weekly average of the issue of THE JOURNAL during 1915 was 67,390 which was distributed to 64,859 Fellows and subscribers. The difference between the issue and the subscriptions is accounted for by copies to exchanges, libraries, advertisers and the reserve copies kept on hand for future orders. The receipts for advertising during the year were $204,837.20—an increase over the previous year notwithstanding the fact that the character of the advertisements is carefully scrutinized and all those are rejected which for sufficient reasons seem not to conform to our high standard.

The percentage of physicians in the United States who are receiving THE JOURNAL is 45.3. At first thought it would appear that this was a comparatively small percentage, considering the value of THE JOURNAL and the position it occupies. However, on several occasions pains have been taken to ascertain the number of physicians who read THE JOURNAL and from the information gathered we can conservatively state that at least 75 per cent. of the physicians of the United States have access to it. As a matter of fact THE JOURNAL reaches a larger percentage of its clientele and covers its particular field more thoroughly than does any other journal issued for any other class, profession, trade or specialty.

THE ARCHIVES

THE ARCHIVES OF INTERNAL MEDICINE now has on its mailing list 2,053 names, including foreign exchanges, libraries, etc., which shows a net loss as compared with 1914 of twenty-four. This is more than covered, however, by the foreign loss due to war conditions. There were 958 names added to the mailing list during 1915, and 982 removed. The total number of copies printed during the year, 28,713, was 1,119 less than those printed the previous year.

AMERICAN JOURNAL OF DISEASES OF CHILDREN

On the first of January there were 2,198 names on the mailing list, indicating a loss of fifty-four names, which also is due to the foreign loss. There are 357 physicians who are taking this journal as Fellows of the Association, substituting it for THE JOURNAL, whereas in 1914 there were 263. The total number printed during 1915 was 29,757, or 1,911 more copies than in 1914.

THE AMERICAN MEDICAL DIRECTORY

The American Medical Directory, just off the press, merits more than a passing notice. It is the fifth edition, and as each preceding edition has been improved over its predecessor, so also this one is better than its predecessors. There is a better arrangement of the preliminary matter and greater accuracy in the personal information. Prior to the publication of this edition, a special effort was made to verify the credentials of physicians who graduated abroad and as a result the information about such physicians is now dependable. By the use of symbols and abbreviations, a large amount of information is included in small space. The European war, however, prevented the use of the specially imported thin paper used in the previous edition. This and the addition of several thousand names have caused an increase in the size of the directory.

We are confident that those who have received the book and have examined it carefully regard it as a credit to the Association, not only because of the character and accuracy of its contents, but also from the mechanical point of view. As with previous editions, all the work on the directory except the binding was done in the Association's own building.

While no edition of the directory has entirely paid for its publication, the fifth edition gives promise of being more nearly self-supporting than the preceding volumes, but it is impossible at the present time to make a financial statement regarding this edition of the directory.

ORGANIZATION WORK

The Association has continued its endeavors to increase the membership of the organization. This work is undertaken only after the assistance of the constituent state association has been secured. With the cooperation of the officers of the state organizations and the officers and members of the component societies, men in the employ of the Association have been sent into certain of the states to solicit subscriptions to THE JOURNAL and Fellowship in the Association, as well as to present the advantages of membership in the organization to physicians of the localities visited. As suggested above, this work has not been undertaken except where it has been agreeable to the officers of the constituent state associations, and when these officers have agreed both to cooperate by assisting the organizers, and to pay a small fee to these organizers for each member who qualifies and whose application is obtained through the efforts of the organizer. The American Medical Association pays the organizers a weekly expense allowance and a salary for the organization work they perform, as well as a percentage on "new business" obtained for the Association. The state associations pay for each new member one half or less than one half of the per capita assessment for the first year received from each new member while this work costs the American Medical Association practically the first year's return from the "new business" obtained. Where the local officers have counseled with and directed the organizers, the work has been mutually advantageous, but the success of the endeavor is conditioned on such cooperation

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau is doing a good work All of the journals owned by the state associations, with the exception of the Illinois journal, are now in this bureau The bureau, in addition to securing advertisements for the state publications, which during 1915 amounted to $16,830 65, also collects data of all sorts relating to advertisements, giving important information There was a net loss to the Association through the bureau of $708 30, which is probably more than offset by the indirect gain, and there is a reasonable prospect that the bureau will soon be self-supporting

Propaganda Department

The Propaganda Department continues its work with regard to medical frauds The layman's interest in the work is shown by the increasing number of inquiries concerning advertised substances which are received In 1915 1 612 such inquiries, as compared with 525 such letters in 1910 Newspapers and magazines also continue to call almost daily for information regarding "patent medicines," and the vigilance committee of the Associated Advertising Clubs of the World is taking advantage of the data this department is able to furnish it People who advertise are recognizing the fact that for their own protection the advertisements cannot be fraudulent A paper which habitually fills its columns with glaring announcements of fraudulent articles is not so good a medium for legitimate and honest advertising There is a growing interest in the subject among educational institutions State and municipal boards of health civic organizations, women's clubs, etc, continue to call on the department for information

Council on Pharmacy and Chemistry

The Council on Pharmacy and Chemistry has continued its work, and has published reports on practically all the widely advertised proprietary mixtures It is confronted with many difficulties, not the least of which are the questions of radium and the mixed vaccines Only time can establish the true place of these substances as remedial agents The little book on "Useful Drugs," which the Council has published, is fulfilling an important purpose and will tend to eliminate the use of the multitude of inert substances which still have a place in pharmacopeias The committee of the Council on Therapeutic Research has secured the investigation of a number of problems regarding the therapeutic value of many widely used but insufficiently understood drugs The problems selected for investigation deal with the determination of the clinical action of drugs, and in this way many therapeutic points are being definitely decided

The work of the Council has reached a stage when little more can be done by the efforts of the Association as a whole, the continuance of the work and the final accomplishment depends on the individual members There is much evidence that the individual members of the profession are prescribing and using the very substances which as a combined body they condemn, and many of the journals which they support advertise and recommend these substances There are many reasons for this, and none of them creditable The first is the financial power of the interests of the manufacturers, and its influence on medical journals This is a constant positive pressure, that opposing is inconstant and negative The leading lay publications of the country show cleaner advertising pages than many of the medical journals The second is due to a credulous order of mind not capable of distinguishing evidence from mere statement, and rendering its possessor an easy victim to the lures of the promoter The third is indolence, which finds it easier in treating patients to follow advice given in advertisements of proprietary drugs than to undertake the arduous task of ascertaining the condition of the patient and to base thereon a sound scientific, therapeutic treatment. No great progress can be made until the medical profession awakes to the fact that the remedy against fraudulent proprietary medicines lies in its own hands—until the profession resolves to believe rather the evidence which is presented by the scientific investigation of the substances than the biased statements of the agents, whether presented by word of mouth or by advertisements

Memorial to Congress Regarding Proprietary Medicines

In accordance with your action on the subject of a memorial to Congress regarding "patent" and proprietary medicines the Trustees appointed a committee consisting of President Rodman, Dr Alexander Marcy, Dr George H Simmons, Dr Hiram Woods and Dr Councilman to present the matter to the President Owing to the death of Dr Rodman and the illness of Dr Woods, only three members of the committee could serve A memorial, which has appeared in The Journal, was presented[1] The president seemed interested, and there is prospect that the request for a government investigation will be granted Such an investigation will lead to a wider knowledge of the matter and possibly some remedial legislation But even this will not avail unless the individual members of the profession will act on the *information obtained* Great assistance in procuring such a commission can be rendered if the members of the House will bring the matter to the attention of their congressmen and urge the measure

Financial

The report of the finances of the Association continues to be favorable, although this year there is a slight loss instead of a gain This is due solely to the expenses connected with the lawsuits A stage has been reached in the contest against "patent medicines" when all the resources and methods of the law backed by almost unlimited means will be invoked by threatened interests These suits must be met and defended by the Association, and if necessary the other welfare work must be temporarily curtailed Without the unusual expenses mentioned, the year would have shown a handsome surplus

Deaths

It is with a feeling of personal sorrow as well as of the great loss which the Association has met that the trustees pay tribute to the character and work of those leaders in the conduct of the affairs of the Association who have died in the past year Dr William L Rodman, the President of the Association and at one time a member of the Board of Trustees, has done work of importance for the medical profession of the country, the last being an endeavor looking toward the formation of a national board of medical examiners He met with the Board of Trustees at the principal meetings, and his counsel, which was practical and conservative, was of great value The Association in his death has experienced a loss not easily repaired Dr Frank J Lutz will be remembered by his colleagues as a sincere, able man, kindly in his nature, with a keen sense of humor, conversant with the best literature of the past, always willing to do the work which fell to him He entered freely into the discussions of the board and his opinions were highly valued The older members of the board will well remember Dr Wisner R Townsend, who for several years was its most efficient secretary, an active energetic man, who attended well to his duties, bringing to bear on the work an orderly, active and capable intelligence With this there is also to each member of the board a sense of personal loss The trustees also wish to pay a tribute to Dr Henry B Favill, whose death came just at the time when he was capable of the greatest service to the profession To the study of the problems of social medicine he brought to bear knowledge derived from close study of the problems, a warm human sympathy, and a rare intelligence It is sad that he could not live to see the fruition of his work

Respectfully submitted,

W T Councilman, Chairman
M L Harris, Secretary
Thomas McDavitt
W W Grant
Oscar Dowling

AUDITOR'S REPORT

Marwick Mitchell Peat & Co Chartered Accountants
105 South La Salle Street

Chicago Ill. Jan 24 1916

To the Board of Trustees of the
American Medical Association Chicago Ill

Dear Sirs

In accordance with your instructions we have audited the accounts of the American Medical Association for the year ended Dec. 31 1915 and now submit our report thereon together with the following statements

Exhibits
- A Balance Sheet as at Dec. 31 1915
- B ' Income and Profit and Loss Account for the year ended Dec 31 1915

Schedules
- 1 Journal Expenses for the year ended Dec 31 1915
- 2 ' Particulars of Provision for Depreciation during the year ended Dec. 31 1915

The balance sheet as submitted herewith, Exhibit A ' in our opinion correctly reflects the financial position of the Association as at Dec 31 1915 subject to provision for accrued interest, taxes and Journal subscriptions paid in advance less subscriptions and memberships due and unpaid.

The following is a condensed comparative balance sheet as at Dec. 31 1915 and 1914

Assets	December 31 1915	December 31 1914	Increase	Decrease
Property and Equipment.	$317 685 05	$328 656 60		$10 971 55
Investments	138 832 50	138 832 50		
Current and Working Assets	106 148 43	75 849 62	30 298 81	
Prepaid Accounts and Reserves	10,233 08	4 794 56	5 438 52	
Total Assets	$572 899 06	$548 133 28	$35 737 33	$10,971 55
Liabilities	154 871 52	123 287 59	31 583 93	
Surplus	$418 027 54	$424 845 69	$ 4 153 40	$10,971 55

Summary

Assets	
Increases	$35 737 33
Decreases	10 971 55
Net Increase	$24 765 78
Liabilities	
Increase	$31 583 93
Surplus Decrease	$ 6 818 15

The net loss for the year ended Dec. 31 1915 amounted to $2 489 20 particulars of which are shown in Exhibit B

The securities representing the investments of the Association were produced for our inspection and found in order

We verified the cash on hand by actual count and the cash in bank by certificate obtained from the bankers, which we duly reconciled with the cash records

The following is a summary of the cash on hand and in bank, exclusive of the insurance cash fund, which was verified by certificate obtained from the depository

Cash on Hand	$ 1,346 85
Cash Fund	50 00
Continental and Commercial National Bank	9,343 44
First Trust and Savings Bank	8,306 41
Total	$19,048 70

Report of the Judicial Council

Dr Alexander Lambert, New York, Chairman, read the report of the Judicial Council which was referred to the Reference Committee on Amendments to the Constitution and By-Laws

The report follows

To the Members of the House of Delegates of the American Medical Association

In presenting its report to the House of Delegates, the Judicial Council desires to call attention to certain amendments to the Constitution and By-Laws which, in its opinion, are advisable both to expedite the increasing volume of business which is necessary to consider in the House of Delegates and to afford greater opportunity to the members of the House of Delegates to take part in the Scientific Assembly of the Association, and also further amendments to separate more clearly the functions of certain officers of the Association

Amendments to Constitution and By-Laws

As the volume of business coming before the House of Delegates has grown, there has been a growing realization from year to year that the mass of business was having an undesirable effect in that it crowded, often into hurried discussion many important matters The first day of the meeting of the House of Delegates is taken up in receiving reports and in other business, referring this to the various committees, and then, in order that the matters brought before it may be properly digested, considered in committee and brought back to the house for action the house adjourns until the following day On the following day, in the morning the General Meeting of the Association takes place, the house not assembling until the afternoon when, at the same time, the sections of the Scientific Assembly begin The real business of the House of Delegates, therefore, is not finished before the beginning of the Scientific Assembly and really begins coincident with it This practically prevents any participation of the delegates in the Scientific Assembly and deprives them of one of the main objects for which they would wish to come to the annual session of the American Medical Association In reality it places a burden on them, at the same time depriving them of certain privileges which they should have the opportunity to enjoy

There has been a growing feeling among the delegates that this situation should be remedied and that it would best be remedied by pushing forward the meeting of the House of Delegates, bringing the first day on the Saturday before the general meeting of the American Medical Association This has come up for decision at various times and been voted down In considering the matter it seems to the Judicial Council that it were wiser to push on to a later day the general meetings of the Association and the first meeting of the Scientific Assembly, that is, that the House of Delegates should continue to meet on Monday and Tuesday taking two whole days to complete its work, and the Scientific Assembly, opening with the general meeting of the Association, should begin on Wednesday and continue through Friday of the week breaking up Friday evening instead of Thursday evening as is now done Those desiring to come to the Scientific Assembly alone would be present the usual three days, from Wednesday until Friday, instead of from Tuesday until Thursday and the House of Delegates would be present from Monday until Friday This seems more desirable than that the delegates should be forced to come on Saturday wait over Sunday again meet on Monday, and stay until Thursday The method here recommended saves twenty-four hours of absence from home duties and does not increase it by twenty-four hours as the former suggested amendments to the By-Laws did To bring this change about, the following amendments to the By-Laws are necessary and are therefore recommended by the Council

That in Chapter III, Section 1 the word "day" be stricken out and the words "two days" be substituted, so that the section which now reads 'Regular Sessions—The House of Delegates shall meet annually on the day preceding the opening of, and at the same place as, the Scientific Assembly of the Association" shall read

'The House of Delegates shall meet annually on the two days preceding the opening of and at the same place as, the Scientific Assembly of the Association"

This would assign the general meeting of the Association to Wednesday and would throw the election of the officers of the Association in the House of Delegates to Friday afternoon for Chapter IV, Section 3 of the By-Laws reads, The election of officers shall be the first order of business of the House of Delegates after the reading of the minutes on the afternoon of the third day of the Scientific Assembly" There is nothing at present in the Constitution and By-Laws which fixes the first day of the Scientific Assembly on Tuesday The Constitution and By-Laws wisely has given to the Board of Trustees full power to control all arrangements for the annual sessions of the Association, as in the By-Laws Chapter VI Section 2 All elections and time of the meetings are designated in the By-Laws as being required to be held on the first, second or third days of the meetings of the Scientific Assembly The following further amendment to the By-Laws is however, necessary

In Chapter II, Section 2 the limit of time for introduction of new business into the House of Delegates is designated as follows "No new business shall be introduced into the House of Delegates after the second day of the Scientific Assembly (third day of the House of Delegates), unless with unanimous consent," etc It is therefore recommended that this By-Law shall be changed to read

"No new business shall be introduced in the House of Delegates after the second day of the annual session of the House of Delegates unless by unanimous consent, and such new business, so presented, whether in the form of a motion, resolution or memorial, shall require a two-thirds affirmative vote for adoption, provided, however, that unless otherwise provided in these By-Laws, new business referred to the House of Delegates by the officers of the sections or by formal action of the sections themselves may be presented to the House of Delegates any time preceding the meeting at which the election of officers takes place"

ELECTION OF A SPEAKER

At various times in the past few years there has come up the question of the election of a speaker for the House of Delegates and with it necessarily the election of a speaker pro tem as a possible substitute In the second year of the existence of the Judicial Council this matter was referred to it for decision The Council was unwilling at that time to decide the question and reported it back to the House of Delegates for its own decision, the house at that time deciding against it. Since then each year has emphasized the desirability, if not the necessity, of having a presiding officer who shall be familiar with the transaction of the business of the House of Delegates and be familiar with the business that recurs year after year and one who may also be familiar with the best methods of expediting business in the house There has been a growing conviction among many delegates that a great deal of time was unconsciously and unavoidably wasted in the House of Delegates in the transaction of its business The Judicial Council, therefore recommends to the House of Delegates that it take up the question of the election of a speaker of the house This requires a change of the Constitution, if the speaker of the House of Delegates shall be put under the general officers of the Association, and to Section 1, Article 9 of the Constitution there should be added the words "a Chairman of the House of Delegates," so that the section shall read

"The general officers of this Association shall be a President, four Vice Presidents a Secretary, a Treasurer, and a Chairman of the House of Delegates"

At the San Francisco session an amendment to this effect was submitted, so it is within the power of the House of Delegates to act on this matter at this session The Council would also recommend that a new section be inserted under Chapter IV of the By-Laws to read as follows

"Section 2 The House of Delegates shall annually elect a Chairman and a Vice Chairman, these officers to serve for one year or until their successors are elected and installed These officers must be Fellows of the American Medical Association and must have been Fellows of this Association for at least the two years immediately preceding their election to this office They need not, however, be members of the House of Delegates, but they shall possess all powers of the presiding officer of this parliamentary body These elections shall follow the election of the treasurer of the Association"

If this is adopted, the Council also recommends the renumbering of the present sections under Chapter IV

One objection which was formerly brought against the election of a speaker of the House of Delegates was that the speaker would necessarily be elected by the house which preceded the one over which he was to preside. This objection is more theoretical than practical for each House of Delegates is now presided over by two presidents neither of whom was elected by the house over which he presides Moreover, at each session of the House of Delegates a still more incongruous situation is in vogue. One president nominates all the reference committees of the house to do the work of the house, nominating whom he chooses and rightly so so far as he is concerned, but the president through whose term of service all the active business must be done, has no voice in naming the reference committees with which he must work Section V, Chapter 4 now reads "The General Officers of the

Association, except the President, shall assume their duties at the close of the last meeting of the annual session at which they are elected," and Section 6, "The President shall be installed at the general meeting of the annual session following that at which he was elected"

APPELLATE JURISDICTION OF JUDICIAL COUNCIL

At the Atlantic City session of 1914 the Judicial Council made the recommendation that it be given certain appellate jurisdiction as follows "In all cases which arise between a constituent association and one of its component county societies, between component county societies of the same constituent state association, between a member of a constituent state association and the component society to which said member belongs, and between members of different component societies of the same constituent state association, the Judicial Council of the American Medical Association shall have appellate jurisdiction" This was laid on the table and referred back to the various constituent state associations for consideration and action before it should be finally passed on by the House of Delegates of the American Medical Association It was not brought up for action in San Francisco in 1915

This recommendation as it stands at present is, in the opinion of the Judicial Council, too broad because it refers to all cases, both of law and procedure, and also to all cases of fact In the opinion of the Judicial Council it should be limited to cases of law and procedure and the question of the settlement of facts should not be brought before it This reopening of questions of fact before the Judicial Council is, in its opinion, very undesirable, because it means the opening of the entire details of the cases brought before it and the going over and the reiteration of evidence already brought out before the councils or the censors of the constituent state associations or the county societies composing them Such questions of fact are best considered and decided in the places where differences of opinion concerning them have arisen They are best decided where knowledge of the credibility of the witnesses can be best appreciated Questions of fact should be considered and decided before being brought to the Judicial Council The questions, however, that come up as to whether or not an aggrieved member has obtained the justice which he sought, or whether or not a just decision has been reached in the matter of law or procedure between societies and individuals may well be a question which can be appealed from the decision of the first courts which decided it

The Judicial Council does not bring this before the House of Delegates with any desire to obtain new power or more power than it now has The Council believes that the House of Delegates intends and desires that the Judicial Council shall be a dignified court to which disputes may be referred for decision, but as at present constituted, the Judicial Council has only original jurisdiction within clearly limited fields There is no question that at present it has only the power and half the functions which a final court of decision should possess, that is, there is no mechanism by which appeals may come up from the constituent state associations to it It has already been forced on certain occasions to ask as a favor the reconsideration of cases by state associations which, in an appeal, would naturally have come to the Council if it had had appellate powers Thus it can be readily appreciated by the House of Delegates that responsibilities are demanded of the Judicial Council and thrown upon it without adequate authority to deal with these responsibilities The position of having responsibility without authority has been forced upon it Such a situation places the Judicial Council in a false and undignified position, which the Council believes the House of Delegates should remedy

ELIGIBILITY OF PRESIDENT

The question of whether or not a member of the Board of Trustees is eligible under the existing Constitution and By-Laws to election to the office of president or vice president during his term of office as trustee came up at the meeting in San Francisco. This question created such a wide difference of opinion that it was very evident it was not clearly stated in the Constitution and By-Laws whether or not a trustee was thus eligible. A question such as this cannot recur without detriment to the harmony and welfare of the American Medical Association The Judicial Council believes, therefore that it should be definitely decided and that positive statements thereon should be inserted in the Constitution and By-Laws and should be brought before the House of Delegates for its decision

The greatest honor that the Association can pay to any member is to elect him president, and during the tenure of his office a president should be permitted to give his entire time to the honorable and honorary duties of his office in presiding at general meetings, in nominating for the consideration of the House of Delegates such candidates for election on the councils and various bodies that are to be confirmed by election of the House of Delegates During the annual session of the Association he should be relieved of the hard work and often wearisome duties of presiding in the House of Delegates and should be able to devote his time to the social and scientific side of the meetings Between the annual meetings of the Association it would seem wise that it should be part of the duties of the president to become familiar with all the varied activities of the American Medical Association The Board of Trustees always extends an invitation to the president to be present at the meetings of the board By attending these meetings the president can familiarize himself with the work the Association is doing

A place on the Board of Trustees is a very honorable position It is particularly honorable because with it goes the responsibility of the care and management of all the activities of the Association The Constitution wisely provides for the election of trustees for a term of three years A term of some years is necessary to obtain the best services from any trustee It requires continuous tenure of office to give the best service to the Association and often for these reasons a trustee is continued in office for several terms After the House of Delegates has bestowed its confidence upon any individual by honoring him with the position of trustee for a definite term of years, and he has accepted the same, it would seem wise that he should fulfil the expectations of serving out his term of years with which the House of Delegates has honored him The Judicial Council would recommend that Article X Section 2, of the Constitution be amended by adding to the section, as it now reads, the following

"No trustee shall be eligible to any other elective office the term of which runs concurrently with the term for which the said trustee has been elected"

It would seem wiser to reiterate in the By-Laws by adding to Section 2, Chapter IV, the following

"No member of the House of Delegates shall be eligible to the office of president or vice-president, nor shall a member of the Board of Trustees be eligible for election to any other elective office the term of which runs concurrently with the term for which the said trustee has been elected"

The Judicial Council calls the attention of the House of Delegates to the report of the Committee on Social Insurance of the Council on Health and Public Instruction This Committee on Social Insurance coordinates the consideration of this subject which has been given by both Councils

Respectfully submitted

Report of Council on Health and Public Instruction

Dr H M Bracken, Minnesota, temporary chairman, read the report of the Council on Health and Public Instruction which was referred to the Reference Committee on Legislation and Political Action

The report follows

To the Members of the House of Delegates of the American Medical Association

The Council on Health and Public Instruction has, during the past year, suffered the greatest loss that could possibly befall it The death of the chairman, Dr Henry B Favill, Feb 20, 1916, not only deprived the Council of its chairman and its chief inspiration, but also deprived the American Medical Association of one of its strongest most effective and valuable members and the medical profession of the country of one of its finest representatives It is impossible to express adequately the loss which we have sustained In order that a proper appreciation of the life, character and professional activities of Dr Favill may appear on the records of the Association the Council requests that a committee be appointed to draft suitable resolutions for adoption by the House of Delegates

The work of the Council during the past year has differed from that of previous years in that many of the plans which have been under consideration and development in the last five years have this year produced definite results, while the formulation of new plans and activities has been somewhat checked, for the time being, by reason of the necessarily limited appropriation made for the Council s work this year, and by the amount of time required on the part of all those officially connected with the Association to look after the details of the libel suit now pending in the courts

The Council is endeavoring to develop the program outlined in 1914 and reaffirmed in 1915 This program includes

1 A thorough investigation of present public health conditions in the United States with a view to securing more accurate information on all phases of the public health program than is now available.

2 Education of the public by every possible means in order that the people may understand the enormous advances in scientific medical knowledge during the last generation and the possibility of utilizing such knowledge in the prevention of disease the reduction of the death rate and the prolongation of human life

3 The crystallizing of such educated public sentiment in necessary public health laws regulations and ordinances which will render possible a conservation of human life, commensurate with our advancing knowledge, and which will render such laws more effective through an educated and enlightened public opinion

Investigation of Present Public Health Conditions

As stated in previous reports this subject naturally divides itself into four parts namely the investigation of federal health activities state health activities municipal health activities and voluntary public health activities carried on by independent organizations In two of these subdivisions, distinct progress has been made by the Council during the last year The other two while of equal importance, have not as yet been developed, for reasons which will be apparent

1 The study of federal public health activities and the inauguration of a survey of the work being done by the different departments of the federal government for public health are still under consideration A tentative plan has been formulated for carrying on this work which it is hoped can be developed during the next year

2 The survey of state public health activities made in 1914 by Dr Charles V Chapin, commissioner of health of Providence, R I, as a special representative of the Council, has been summarized in a comprehensive report by Dr Chapin, including a rating sheet of the forty-eight state health organizations and exhaustive tabulations of their various activities, appropriations expenditures, etc. This report submitted to the Council by Dr Chapin was ordered published A preliminary edition of 1 000 copies was issued in February and distributed shortly before the midwinter conference to members of state boards of health and officers of the Association The first edition was distributed largely for the purpose of securing suggestions and criticisms Communications on various phases of the report have been received from twenty-three states These have been referred to the members of the Council and to Dr Chapin for consideration and will be taken up in detail at the meeting of the Council to be held during the Detroit session It is probable that the Council will order a revised edition for general circulation

The survey of Dr Chapin and the publication of this report will it is hoped mark the beginning of as distinct a movement in the public health field as the first report and classification of medical colleges by the Council on Medical Education inaugurated in the educational field The situation is, in many ways, identical Neither the Council nor Dr Chapin as its representative has, or possibly could have, the slightest authority All that we can do is to secure the facts regarding the work being done in each state, and so far as possible tabulate and summarize these facts so as to arrive at some kind of average or standard which can be used for the purpose of grading the work in different states so as to institute a comparison that will be not only illuminating but also stimulating Prior to the publication of Dr Chapin's report, there was no possible way in which the public health work being done in different states could be compared and estimated It is now forty-seven years since Massachusetts in 1869 established the first state board of health Each state has followed its own ideas and inclinations in establishing and developing its state public health work. It is today impossible to determine, except in terms of individual opinion what is the ideal or desirable form of state public health organization, what such an organization should include how many men are required to conduct it, or what should be its cost For states like Nevada, Montana, Arizona and New Mexico to undertake to model their state public health organization on the same plan as that of New York and Pennsylvania is manifestly absurd It is impossible to say how many men an adequately organized state health department should have, how many of them should be full time men, what equipment such a department should have, what relation it should bear to local or county health administration, and how much it should cost the people of the state, either totally or on a per capita estimation It is also impossible to determine whether, for the amount that is being spent, the people of any state are getting value received for their money or how near they are coming to such a realization Dr Chapin's study of this entire field is the first effort that has been made to obtain a comprehensive view of the entire subject Necessarily limited as to time and funds, the survey and the report have already proved of the greatest value and interest to those interested in state public health work. This interest will increase with the publication of a larger revised edition of the report Through the rating sheet, which is the summing up of the entire report, it is possible to compare the work done in any state with that done in any of the other forty-seven not only as to the total value of such work, but also on each of twenty different points This makes it possible not only to compare state with state, but also to say wherein each state excels or is deficient in each detail The Council hopes at the end of two or three years to make another survey for confirmatory and comparative purposes the second survey to be used as a basis for classification of the states according to the character of the public health work being done, somewhat along the same lines as the classification by the Council on Medical Education of medical schools into A, B and C classes

3 As stated in last year's report, the Council has been desirous of inaugurating a survey of municipal public health work similar to that made by Dr Chapin in state public health work but so far has been unable to devise any feasible plan for this purpose The same situation is manifest in the municipal field Practically all of our leading cities and many of the smaller ones have during the past twenty-five years established some kind of municipal health organization, either through definite organization or by slow development. The form which this organization has taken, however, has been largely accidental or determined by the views of those responsible for the organization or administration of each individual local department. In many of our cities, there are today local health organizations that are completely manned and equipped and giving excellent and efficient services to the people for the protection of the public health On the other hand there are many local public health organizations which exist on paper only which consist of so-called health officers without adequate training owing their appointment to political influence, drawing in some cases ridiculously small salaries for an indefinite amount of services, having no adequate machinery or properly equipped laboratories to carry on their work, and entirely unable to protect their community against disease. Not only is it impossible to say what are

today the actual facts regarding municipal health work, but it is equally impossible with the data at our disposal to determine what should be the ideal conditions During the past year, the secretary has received a number of requests for information and advice as to what kind of a health department should be organized in a town of a given size, how many men would be required, how much should be spent for equipment, and how large an appropriation should be made to cover the annual cost of operation These questions cannot be answered definitely at present During the coming year the Council hopes to make a definite study of this problem and to present a report which will show what is actually being done in municipal health work, how much it is costing, and what kind of health organization should be established for cities of different sizes

4 In the fourth field of investigation, that of voluntary public health organizations, the report of the Central Committee on Public Health Organization, referred to in our report for 1915, was published in pamphlet form in the fall Two editions have been printed and distributed, and the supply is practically exhausted This pamphlet, containing the tabulated reports of forty-six voluntary public health organizations, was immediately accepted as authoritative and has been in great demand At the Rochester meeting of the American Public Health Association, held in September, 1915, a conference of executive officers of voluntary public health organizations was held, at which the Central Committee presented its report After general discussion, the report was accepted and the committee discharged and a new Committee on Coordination created with power to act. This committee consists of Dr Charles J Hatfield, Philadelphia, secretary of the National Association for the Study and Prevention of Tuberculosis, Prof Selskar M Gunn of Boston, secretary of the American Public Health Association, Dr W F Snow of New York City, executive secretary of the American Social Hygiene Association, Mr Curtis E Lakeman of New York City, secretary of the American Association for the Control of Cancer, and Dr Frederick R Green, secretary of the Council This committee has had two meetings since its appointment, and is carrying on a discussion by correspondence as to the best means of promoting cooperation between existing organizations The proposition for a joint meeting of all the organizations interested in connection with the 1916 session of the American Medical Association could not be carried out The efforts of the Council during the last three years in the direction of cooperation, however, have borne fruits in the cultivation of a spirit of cooperation among many of the leading organizations to an extent that amply justifies the efforts that have been made The death of Dr Favill and the necessity of taking up other lines of work for the time being have prevented the further development of this plan, but we hope that, during the coming year, further efforts in this direction may be undertaken

PUBLIC EDUCATION

PRESS BULLETIN

The *Press Bulletin* was published regularly during the latter part of 1915 Since the first of January, 1916, however, the bulletin has been temporarily suspended, owing partly to the necessity of overhauling and revising the mailing list and changing the form of the bulletin, but principally to the fact that the secretary's time and efforts have been necessarily diverted into other channels

SPEAKERS' BUREAU

Owing to the limited appropriation given to the Council this year, the secretary recommended to the Council at its October meeting that the Speakers' Bureau be put on a self-supporting basis, namely, that the local organization and committees asking for speakers be asked to pay the actual traveling expenses and entertainment of the speaker This recommendation was made for several reasons It has been apparent for several years past that the amount of money available for the payment of speakers' expenses would be at best entirely inadequate for the amount of work which should be done. If this work had been pushed during the last five years, it would be possible to use practically all of the available surplus of the Association each year in supplying speakers for local public health meetings This is manifestly impossible It is equally impossible for the Council to use any large portion of its appropriation for this purpose If only one or two thousand dollars a year can be spent in this work, the amount available would generally be completely exhausted in the first six months of the year, leaving nothing for the remainder of the year, and at best it would be possible by such a plan to provide only a small portion of the speakers asked for and desired In a word, for the Council to attempt to finance a speakers' bureau, which would cover the entire country, would mean either that it would need a very large appropriation for this purpose or that it would be compelled to limit its work in this direction to the very narrow boundaries of a small appropriation On the other hand, if the bureau is made self supporting, there is no limit to the extent to which it can be developed

The Council approving of this proposition, it was necessary to revise and reprint the speakers' list, also to advise each one of the 250 speakers on the list that the plan of operation had been changed and to secure his consent to fill appointments under the new plan This has been done during the winter Early in the summer it is hoped that we can issue a new announcement which can be distributed in large numbers throughout the country

PAMPHLETS

The most marked development of the past year in the educational work of the Council has been the number and variety of pamphlets on different subjects printed and distributed by the Council The list in Table 1 will show the number

TABLE 1 — NUMBER AND CHARACTER OF PAMPHLETS PRINTED AND DISTRIBUTED, JUNE 1, 1915, TO MAY 16, 1916

Defense of Research, Pamphlet XXVIII "Biological Research Its Value and Dangers"	2,000
Report of the Committee on Conservation of Vision, 1915	1,000
Conservation of Vision, Pamphlet I "Schoolchildren's Eyes"	1 000
Conservation of Vision, Pamphlet III. "Wearing Glasses"	1,000
Conservation of Vision, Pamphlet IV "The Relation of Illumination to Visual Efficiency"	1,000
Conservation of Vision, Pamphlet V "Trachoma in Eastern Kentucky"	1,000
Conservation of Vision, Pamphlet VI "Auto Intoxication and the Eye"	1,000
Conservation of Vision, Pamphlet VII "Eye Strain"	1,000
Conservation of Vision, Pamphlet XII "Ordinary Eye Diseases"	1,000
Conservation of Vision, Pamphlet XIV "Visual Requirements of Transportation Employees"	1,000
Conservation of Vision, Pamphlet XVI "How Whisky, Tobacco and Drugs Affect the Eyes"	1,000
Conservation of Vision, Pamphlet XVII "Oculists and Opticians"	1,500
Conservation of Vision, Pamphlet XVIII "Preparations for the Oncoming of Blindness"	1,000
Conservation of Vision, Pamphlet XIX "What to Do for Blind Children"	1,000
Conservation of Vision, Pamphlet XX "Blindness from Wood Alcohol"	1,000
Prevention of Cancer, Pamphlet VIII "What Every Woman *Should Know About the Breast*"	7,000
Sex Hygiene "Margaret the Doctor's Daughter"	6 000
Sex Hygiene "Life Problems"	6,000
Sex Hygiene "John's Vacation"	6,000
Sex Hygiene "Chums"	5,000

TABLE 1—(*Continued*)

Public Health "Baby Welfare"	4,100
Public Health "Hookworm"	1,000
Public Health "House Fly"	2,600
Public Health "Measles"	3,500
Public Health "Pure Water"	500
Public Health "Scarlet Fever"	6,500
Public Health "Small Pox"	1,000
Public Health "Tuberculosis"	8 100
Public Health "Typhoid Fever"	6,100
"Save the Babies"	281,000
"Baby Health Conferences"	6 000
"Minimum Health Requirements for Rural Schools"	750,000
"The Present Condition of Public Health Organization in the United States"	1 500
Sample pages, "Regulation of the Practice of Medicine"	1 000
'Regulation of the Practice of Medicine"	1,000
"The Public and the Medical Profession"	1,000
"A Report on State Public Health Work'	1,000
"What Is Chiropractic?"	2,000
"Facts for the Tuberculous"	500
"Public Health Cartoon Prints"	2,600
"An Outline for a Study Course on Public Health" (for women's clubs)	3 000
"Some Essentials to the Development of Efficient Health"	1,000
"State Regulation of the Practice of Medicine"	1,000
"State Health Organization '	1,000
Total	1,133 500
Score Cards	55 000
Grand total	1 188 500

and character of such pamphlets printed and distributed from May 22, 1915, to May 16, 1916.

The largest two items on this list require some explanation. The pamphlet on "Minimum Health Requirements for Rural Schools" printed last year was the first of a series of four pamphlets prepared by the Committee on Health Problems in the Public Schools appointed jointly with the National Educational Association. As last year's report shows, 55,000 of these pamphlets were printed, of which 40,000 were sent to Hon. P. P. Claxton, the federal commissioner of education, for distribution through his bureau. At the meeting of the National Council of the National Educational Association, held in Cincinnati, Feb. 23, 1915, it was agreed that the widespread distribution of this pamphlet was the most important single work to be undertaken by the committee. Dr. Claxton asked for an edition of 750,000 at an estimated cost of $3,000. The publication of this large edition was made possible through the generosity of the Elizabeth McCormick Memorial Fund of Chicago, as stated in last year's report. Following the San Francisco session, the preparation of this edition was undertaken, and by the last of December, 1915, the entire edition of three quarters of a million pamphlets had been printed, bound, addressed and mailed to every rural schoolteacher and rural school board member throughout the country, as well as to every state and county superintendent of education and every state normal school. The addressing and franking was done through the federal Bureau of Education.

This work is a striking example of the value of intelligent cooperation between various organizations interested in the same line of work. The pamphlet was prepared by a joint committee of the American Medical Association and the National Educational Association. The funds for printing an edition of three quarters of a million copies were supplied by the Elizabeth McCormick Memorial Fund of Chicago, and the addressing and distributing was done through the federal Bureau of Education. In this way, at an actual expense of $3,000, 750,000 pamphlets were placed in the hands of those most interested in the problem of rural school conditions and those most capable of remedying conditions.

The second instance of cooperation is to be found in the printing and distribution of 281,000 copies of the "Save the Babies" pamphlet. This pamphlet, originally issued by the Committee on Women and Children's Welfare, as an adjunct of baby health conferences, has proved exceedingly popular, and has created a demand for itself far in excess of the original plan. Here again the problem of cost enters into the situation, but in this instance this difficulty was solved in an unexpected manner. Mr. G. F. Earnshaw of the Earnshaw Knitting Company, Chicago, a firm engaged partly in the manufacture of children's garments, became greatly interested in the entire problem of child conservation, and suggested the possibility of utilizing the dry-goods stores of the country in a systematic campaign for the education of mothers. This plan was suggested too late in the year to permit of full development in time to coincide with the proposed Baby Week of the federal Bureau for Child Welfare. Owing to the short amount of time available as well as the expense involved, it was not possible for the Council to take up Mr. Earnshaw's first proposition, namely, that the Speakers' Bureau of the Council furnish speakers on public health for mothers' meetings to be held in all the large dry-goods stores during the proposed Baby Week. The secretary, however, offered to bring the local dry-goods men and the officers of the local medical organizations into communication with each other and to turn over to the local societies in each case the task of furnishing speakers for these meetings. This was done in a large number of instances.

In twenty-nine cities, cooperation was established between the dry goods stores and the local medical organizations; the medical society furnished speakers and the dry goods stores furnished a meeting place and advertised the meetings to the public. Women and especially mothers were urged to attend. In some cities, meetings were held daily or twice a day. In seven other cities, meetings were held by the local dry goods stores and addresses made by speakers selected by the proprietors. In a number of cases baby health conferences, children's clinics and health exhibits were held in connection with the baby week observances. Cooperation was established not only with local medical societies, but also with local health departments, public schools, public libraries, commercial clubs, trained nurses' organizations, day nurseries, hospitals and other philanthropic organizations. Over 200,000 copies of the "Save the Babies" pamphlet were sold to dry goods stores for free distribution to mothers. The cooperation shown in working out this plan has been most gratifying, and the possibilities of further development in succeeding years are encouraging.

Attention should also be called to the nine public health pamphlets prepared and printed for the use of state boards of health. Of these, over 30,000 have been printed and distributed during the past year. Further additions to this series are in preparation.

WORK OF THE MEDICOLEGAL BUREAU FOR THE YEAR ENDING MAY, 1916

During the past year, work on the three digests, as mentioned in the report for the year ending May, 1915, has been in progress. These are the digest of the Supreme Court decisions on the medicolegal relation of physicians, the digest of Supreme Court decisions with reference to malpractice and the digest of Supreme Court decisions on the powers and duties of state boards of health. The first of these digests is about half completed, 874 cases out of a total of 1,697 having been abstracted and cited. This digest covers the personal rights and liabilities of physicians for personal injuries, exclusive of malpractice, crimes and contract; physicians as witnesses, and miscellaneous medicolegal relations of physicians, chiefly statutory. On the subject of professional malpractice we had on hand at the last report 261 cases; these have been added to. It is estimated that there are between 1,200 and 1,500 cases on record on this subject. On the powers and duties of state boards of health there are 396 decisions on hand and abstracted, 100 decisions which have not as yet been abstracted, and 256 citations for which we have not as yet been able to secure the decisions, making a total of 752 cases under this head. These have been materially added to since the last report, making approximately 800 cases in all.

During the current year, approximately eighty-nine inquiries have been received and answered on medicolegal subjects.

These inquiries embrace requests for information as to the liability of physicians in contract and malpractice, and various miscellaneous subjects, such as advertising, anesthetist's fees, powers and duties of medical examiners, obligation resting on physicians to care for patients, laws affecting Christian Scientists, chiropractors and other cults, embalming, fee-splitting, use of narcotics, marriage, sterilization, midwifery, mental defectives, nurse registration, pharmacists, ownership of Roentgen-ray plates, vital statistics, and miscellaneous inquiries in regard to nuisances and public health in general.

LEGISLATION

FEDERAL

Quite a number of laws have been introduced into Congress during the past winter touching on public health matters and of interest to physicians. To date none of these have passed excepting a bill providing for the national control of leprosy.

STATE

During the past winter the legislatures in ten states have been in session. The following summary shows the principal legislation as far as it has been reported up to the time of drafting this report.

Ten states have been in session, and of these from the reports so far received, five have adjourned. Laws have been enacted as follows:

KENTUCKY. Adjourned. Laws limiting the right to bring an action for malpractice to one year, providing penalties for fee-splitting, forbidding illegal advertising and regulating the sale and manufacture of food supplies.

LOUISIANA. Still in session.

MARYLAND. Adjourned. A law increasing the appropriation for the state department of health, $18,000, and Johns Hopkins University, $15,000.

MASSACHUSETTS Still in session Measures have been enacted amending the drug laws, the laws specifying the duties of local boards of health, the law for the care of tuberculous cases and regulating the stamping and labeling of receptacles for food and the like

MISSISSIPPI Adjourned Laws were passed increasing the appropriation for the state health department from $23,000 to $32,000 annually, establishing a sanatorium for the care of incipient tuberculous patients, and one for the prevention of blindness

NEW JERSEY Still in session

NEW YORK Still in session A measure transferring the state quarantine to the federal government has been passed

RHODE ISLAND Adjourned No report

SOUTH CAROLINA Still in session

VIRGINIA Adjourned Laws were enacted to provide for the control of potable waters, authorizing counties and cities to establish tuberculosis sanatoriums, to restrain persons suffering from tuberculosis, providing fees and maintaining indigent consumptives, amending the law defining the powers and duties of the state board of health, and prohibiting the use of roller towels

NEW COMMITTEES

November 11, the secretary received from Dr John B Andrews, secretary of the American Association for Labor Legislation, a pamphlet containing a tentative draft of a model bill for industrial insurance, together with an editorial for publication in THE JOURNAL and the *Press Bulletin* In this tentative bill, the provisions regarding medical services were intentionally omitted in order that this entire question might be taken up by the representatives of the organized medical profession and properly discussed Realizing the importance of this subject to the physicians of the country, and knowing that these questions had been practically ignored in the passage of the national insurance acts in Germany, England, Denmark, Norway and other European countries, the secretary at once wrote to Dr Andrews proposing the appointment of a committee to represent the American Medical Association and to work with him in the elaboration of the details of the model bill affecting physicians A cordial reply was at once received from Dr Andrews, stating that he would be very glad to have such a committee appointed After discussion with the chairman and Dr Craig and some correspondence with Dr Alexander Lambert, it seemed obvious that this entire question, being both an ethical and an economic one, should be in the hands of a committee that would be recognized as representative and authoritative The Judicial Council has no authority under the by-laws to appoint committees, while our Council has such authority The secretary, therefore, proposed to Dr Favill and Dr Lambert that the Council on Health and Public Instruction appoint a Committee on Industrial Insurance to consist of Dr Alexander Lambert, chairman of the Judicial Council, as chairman, Dr Henry B Favill, and a third member to be selected by Dr Lambert, who could cooperate with him in New York After some correspondence, Dr Lambert suggested Dr Frederic J Cotton of Boston, and in accordance with this recommendation, the chairman appointed such a committee This action was confirmed by the Council, and the committee appointed The death of Dr Favill makes a vacancy on the committee which will be filled in the near future Dr Lambert as chairman of the committee has secured the services of Dr I M Rubinow of New York as the executive secretary of the committee, has established headquarters, has begun the collection of material on social insurance, and is now prepared to make an exhaustive and authoritative study of the subject for the benefit of the Association and its members The Council urgently recommends that the House of Delegates request all state and local organizations to suspend action on this important subject until the special committee has formulated a definite platform on which the United States medical profession can stand, and a definite program for looking after the interests of physicians in this work The details of the work of the committee will be found in the special report by Dr Lambert

STANDARD STUDY PROGRAM FOR WOMEN'S CLUBS

In 1913, at the annual meeting of the Conference of State and Provincial Boards of Health, Dr S J Crumbine, secretary of the State Board of Health of Kansas, presented a program which he had prepared at the request of the women's clubs of Topeka, consisting of study outlines for eighteen meetings of the club to be devoted to the study of public health This program proved so popular that in a short time Dr Crumbine received requests for it from clubs in all parts of the state Impressed with the value of this method of public education, he recommended, as president of the Conference of State and Provincial Boards, that a committee be appointed to prepare a standard program for those women's clubs desiring to take up the systematic study of public health conditions This recommendation being approved, the committee was appointed, consisting of Dr Crumbine, Dr J N Hurty of Indiana, and the secretary of the Council In 1914, at the biennial meeting of the General Federation of Women's Clubs, this subject was discussed with Mrs S S Crockett, chairman of the Department of Public Health, and Miss Helen Louise Johnson, chairman of the Department of Home Economics of the General Federation, as well as with the members of the general board Miss Johnson on the unanimous request of the committee agreed to cooperate with us Since that time, three meetings of the committee have been held and a considerable amount of correspondence has been carried on, which has resulted in the preparation of a provisional program for public health study in women's clubs consisting of programs for eighteen meetings An advance edition of this program has been printed and 3,000 copies distributed at the New York biennial of the General Federation

MIDWINTER CONFERENCE

By special arrangement, the Midwinter Conference this year was held not only in connection with the Council on Medical Education, but also with the Federation of State Medical Boards and the American Association of Medical Colleges By agreement between the four secretaries interested, the time was divided up so that the joint meetings could be held with separate business meetings of the four organizations The second day of the conference was devoted to public health and legislation, the morning being occupied by a discussion of the state regulation of the practice of medicine The program this year was especially significant Gov George H Hodges of Kansas presented the opening address on the subject, giving his experience as an executive, and Prof Irby R Hudson of Nashville, Tenn, secretary of the new Board of Preliminary Examiners of that state, presented a year's experience with this new law These addresses were discussed by Dr Horace D Arnold, representing the Council on Medical Education, Dr Walter L Bierring, representing the Federation of State Medical Boards of the United States, Dr W J Means, representing the American Association of Medical Colleges, Dr Royal S Copeland, representing the homeopathic school, and Dr John K Scudder, representing the eclectic school The afternoon was devoted to a discussion of state public health organizations, Dr Charles V Chapin of Providence, R I, discussing this subject, and Dr J W Kerr, Assistant Surgeon-General of the United States Public Health Service, discussing some essentials to the development of efficient health organization The program was on the whole one of the most profitable which has been presented on these subjects

SPECIAL ACTIVITIES

PUBLIC HEALTH SUNDAY

Following the custom of the past five years, the secretary of the Council, with the cooperation of the local committee, arranged to furnish a speaker on some appropriate public health topic for every church in Detroit desiring such an address, Sunday, June 11 The indications at the time this report is drafted are that this occasion will be quite as successful as in previous years

PUBLIC HEALTH MEETING

One of the most serious defects in our annual program in past years has been that there was no marked event which brought the annual session of the Association to a close The success of the Commemoration Day meeting at San Francisco last year, and the growing interest in the public health addresses in the different churches, suggested the idea of holding a general meeting open to the public for the presentation of appropriate public health topics on Friday afternoon, as the closing event of the session This plan having been approved by the Council and the Board of Trustees, arrangements were made for securing the Lyceum Theater, and through cooperation with the Michigan State Board of Health and with the Detroit Department of Health, plans have been made to observe Friday, June 16, as a special public health day A public health parade under the auspices of the state board of health will be held just before the meeting An appropriate program has been arranged, and through placards, newspaper notices, special announcements, etc, an invitation has been issued to the people of Detroit to attend this meeting as the guests of the Association It is hoped that the success of the first meeting will justify the Council in making this meeting a permanent feature of the annual sessions of the Association

OFFICE WORK

During the past year, the secretary has received 6,000 letters and has written 7,638 Requests for information from the sources indicated in Table 3 have been received and answered

SUBCOMMITTEES

The reports of the various subcommittees are appended herewith The members of these committees have labored faithfully and enthusiastically to advance the special lines of work assigned to them, and the results of their labors are herewith submitted for the careful consideration of the House of Delegates and its reference committees

Respectfully submitted

Henry M Bracken, Chairman,
Walter C Cannon,
Watson S Rankin,
Milton Board
Frederick R. Green, Secretary

REPORTS OF SUBCOMMITTEES OF THE COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

Report of Committee on Social Insurance

To the Council on Health and Public Instruction

In January, 1916, the chairman of the Council on Health and Public Instruction, Dr H B Favill, wrote to the chairman of the Judicial Council asking that the chairmen of the two councils join together in forming a committee to study social insurance in its relation to the medical profession The importance of this work had recently grown more and more evident and it seemed that in all probability this subject would be, in the next few years, one of the most important that would occupy the attention of the profession both from an economic and a purely medical and surgical point of view Dr Favill appointed as a third member of this committee Dr Frederic J Cotton of Boston, who had been chairman of the Committee on Compensation of the Massachusetts State Medical Society for a number of years Dr Lambert, chairman of the Judicial Council, was appointed chairman of this committee. The committee was appointed under the power invested in the Council on Health and Public Instruction to appoint committees to carry on the respective purposes of the Council, and it seemed evident that any subject such as social insurance, affecting so intimately the health of the community and the interests of the profession, was one which clearly came under the duties of the Council to study and to assist in its development, and especially to safeguard the interests of the profession in this development

At a meeting on Feb 9, 1916, the Board of Trustees confirmed the appointment of this committee by the adoption of the following resolution

"That the committee appointed jointly by the Council on Health and Public Instruction and the Judicial Council, consisting of Drs Alexander Lambert, Frederic J Cotton and H B Favill, be approved, and that the purpose and duties of this committee be understood to be the careful compilation of information in *re* social or health insurance and the relations of physicians thereto, and to do everything in their power to secure such constructions of the proposed laws as will work the most harmonious adjustment of the new sociologic relations between physicians and laymen which will necessarily result therefrom, and that this committee be authorized to carry on its work wherever seems most desirable"

The services of I M Rubinow, M D Ph D, who was Chief Statistician of the Ocean Accident & Guarantee Corporation and President of the Actuarial Society, were secured as Executive Secretary, and a bureau has been opened at 131 East Twenty-Third Street, New York City

The Committee on Social Insurance presents to the House of Delegates a statistical study of the medical profession of the United States in its various relations, both in the ratio of physicians to population, their geographic distribution, and the various other statistical facts that are of importance and interest to the profession There are at present no reliable figures concerning the income of physicians and other economic facts of interest The committee is endeavoring to obtain reliable information concerning this matter

In the near future it is the intention of the committee to undertake the following duties

First—to educate the American medical profession in the general principles of social insurance, particularly health insurance, the economic and social significance of the movement to obtain such insurance throughout the United States, and the absolutely essential part which the medical profession must play in a successful adaptation of this new legislation to American conditions,

Second—the bureau will consider it as part of its work to answer all questions which any physician may desire to write to it, asking for information, facts or figures bearing on social insurance in any of its phases, and to be in reality a bureau of information for the medical profession in regard to the details of organization, of medical aid in various forms of social insurance, both in European countries and the United States,

Third—the committee considers it its duty to appear when advisable before the legislative bodies in this country with a view to bring about friendly understanding between all parties concerned and to protect the legitimate economic interests of the profession in the laws coming up for discussion concerning social insurance

The work of this committee should be directed in such channels as to avoid the conflict which has arisen in England at the beginning of a similar movement and which has resulted in a very large amount of bitterness between the profession and the public that might easily have been prevented by appropriate timely action.

It is further the intention of the committee to undertake the following lines of work without assuming the obligation of completing them within any specified time

First—to collect a bibliography on social insurance with special reference to medical questions involved,

Second—to undertake, by correspondence, to get in touch with the various sickness insurance organizations in Europe so as to obtain first hand information as to their experience

Third—to undertake a statistical study of hospital and dispensary facilities in this country in view of the possibility of mutual sickness societies exist to which both employers and employees must contribute, medical attendance is furnished and medicines and sick benefits to disabled members, and in case of death, relief to their families. Cash benefits or annuities to widows and orphans or dependent parents may also be paid. Assistance for wives and children of members called into the territorial or reserve military services may also be provided, and special pensions for widows and orphans of such deceased members.

These obligatory societies are maintained by deductions from wages which must not exceed 2 per cent. of the wages nor $9.60 per year, by payments by the employers of a sum equal to one-half the aggregate amount paid by members, by subsidies from the government, by sums donated or bequeathed by charitable persons, and by fines incurred for infringement of rules or regulations. The government looks on these societies with great favor. In 1907 about 6,000,000 wage earners were thus protected, leaving probably an equal number of the industrial workers of France still uninsured against sickness.

Switzerland.—Switzerland, having passed its law of subsidized sickness insurance in 1912, has the latest and best law of this type. According to Rubinow, the Swiss law not only aims to stimulate the formation of sick benefit societies but also to improve the nature of their service. This law provides a schedule of subsidies adjusted to the extent of the society's activities, 67.5 cents for children under 14 and the same amount for each male adult, 77.2 cents for each female adult if only one of the two mentioned functions—sickness benefits or medical aid—is provided, and 96.5 cents if both features are furnished, and $1.06 if sick benefits are furnished for 310 consecutive days. This subsidy may be increased in mountainous districts to $1.35. An additional subsidy of from $3.86 to $7.72 is given in cases of confinement. The Swiss law further stipulates that sick benefits shall not be less than 19.3 cents per day. It requires, also, that not less than three months must expire after entrance into the society before the new member may draw benefits, but a waiting time after falling sick must not be longer than three days, and the confinement benefits must be granted for at least six weeks. The law also requires that the society shall be financially sound, and it prescribes a definite system of organization of medical and pharmaceutical help which prevents excessive cost of services and gives to the sick member a certain selection of physician. This last factor of cost and choice of physician, we shall see later, has been the stumbling block in all countries.

It has been a noticeable feature in the subsidized state insurance schemes that the rapidity and energy of their growth seems to have been in ratio to the subsidies obtained from the state. Without state aid only the more thrifty and well-paid of the workers seem voluntarily to insure, and many of these often are unable to keep up their insurance, and drop it. As long as the state held aloof and simply regulated the control without giving assistance, the growth of this voluntary insurance has always been slow. The more the state has given assistance, the greater has been the number of workmen who have been able to obtain the protection they seek. After twenty-five years' experience in various voluntary forms of sickness insurance, subsidized or not, several nations in Europe have realized that the logical conclusion was compulsory state insurance in which workmen and employers alike contributed and the state assisted with amounts sufficient to insure the payment of the management of the huge machine. The ratio of those insured to the total population is interesting, comparing it in the countries of voluntary insurance and compulsory insurance.

Denmark has a total population of 2,757,000, insured 710,000, which is 25.8 per cent. of the population. In France the 6,000,000 insured equals about 10 or 12 per cent. of the population, in Great Britain the 14,000,000 insured of the 45,000,000 population is 31 per cent. of the population. In Germany, in 1912, there was a total population of 64,000,000 and there were 19,000,000 insured, giving about 31 per cent. insured. It is very noticeable that five countries of Europe between 1909 and 1912 passed acts of compulsory insurance: Norway in 1909, Serbia in 1910, Great Britain in 1911, Russia in 1912, and Roumania in 1912.

In discussing workmen's compensation last year, it was shown that 6 per cent. of the industrial workers suffered from accident during the year, and it was also stated that from 40 to 50 per cent. suffered from some form of sickness. It was shown last year how clearly certain occupations increased the liability to accident, and attention was drawn to a table published showing the influence of sex and occupation on certain diseases. Every important occupation has its own definite sickness rate. This is outside of the so-called well recognized occupational diseases. These two tables are published in page 39 of the Judicial Council Report for 1915.

In the Report on Sickness Insurance of the Committee for Immigrants of America, discussing these same tables, it is shown that the data coming from the Leipzig sick fund eliminate the variations produced by race, sex and age. The industrial factor is isolated and is evidently a strong one. The variation between industries is less marked than in the case of accidents. All excess of sickness found above the minimum rate of those of office employees can be charged in a great measure to industrial conditions. For example, if the chance of taking sick is only 21 per cent. for office employees, for men, and 21.4 per cent. for women, and in hotels and restaurants the rate is 32.5 per cent. for men and 40.9 per cent. for women, and the annual loss of days through sickness per person is, for the office employees, 5.8 for men and 7 for women, and for hotels and restaurants it is 8 days for men and 12.2 for women, then the extra 2.2 days' loss per person per year for men and 5.2 per person per year for women can be justly laid to the difference in the environment of those working in hotels and restaurants and those working as office employees. The loss, therefore, should be distributed as in accident insurance, so that the industry may bear its just share and the state not only accept equal responsibility for sickness as for accidents to assist those who need it. It would also seem that there was equal justification for such aid as that in which the states and municipalities now accept the responsibility of spending large sums in preventive hygiene, as seen in health department work, and also large sums in public hospitals and dispensaries.

COMPARISON OF METHODS ABROAD

To understand compulsory insurance and its workings, a comparison of the methods of Norway, Russia, Austria Hungary, Germany and Great Britain will give the clearest idea.

Russia.—The mining industry was the first one of the great industries to develop in Russia, and as long ago as 1806 there was a law requiring proprietors of mining and metallurgical industries to establish hospital facilities for sick or injured employees, and many of these establishments were owned by the state or crown. This idea was developed further in 1866 when an epidemic of Asiatic cholera broke out in Moscow. The governor of Moscow, considering the large factories where the insanitary conditions and large number of workers were the means of spreading the cholera epidemic, in a letter to the minister of the interior requested that they be required to establish hospitals and employ physicians in connection with their industrial hospitals. The law of 1866, therefore, provided that there should be established in connection with each factory employing 1,000 workers a hospital with ten beds, and at each factory employing more than 1,000 workers fifteen beds or more, and at each factory employing less than 1,000 workers five beds or more at the rate of one for each hundred workers. Although this law was declared to be a temporary measure, it is still in force. The establishment funds connected with all large industries in Russia are based on the existence of this original order of the emperor.

Outside of the city of Moscow the following regulations established by the provincial factory commission is given as a type.[3] Factories employing 500 or more workmen are required to have a factory hospital with one bed for each hundred workmen, a resident physician and a "feldsher," who is a medical assistant of higher grade than a trained nurse. When the number of workmen exceeds 3,000, two physicians must be employed, one of whom must reside at the factory. Factories employing from seventeen to 500 workmen may make arrangements with the zemstvo hospitals, or several factories may combine for establishing a common hospital When the factory hospital has less than five beds, the physician need not reside at the factory but must not live more than 7 versts (4.7 miles) from it and must visit it at least three times a week, but the hospital must have a resident feldsher If the factory has no hospital of its own and is more than 2 miles from the hospital to which it can send its workmen, this factory must have an emergency room with all necessary appliances for first aid, and if the number of workmen exceeds 200, it must also have a feldsher The hospital which cares for more than 500 workmen must have a general ward and contagious ward with facilities for isolation, and a dispensary for outside patients, where both men and women are employed, there must be wards for each sex. In factories employing from 200 to 500 workmen, the hospital must contain at least two wards an examination room, and a waiting room for outside patients In factories employing less than 200 workmen two wards are required one for the beds and one for the outdoor patients Where 200 or more women are employed, a special maternity room must be provided and also the services of a resident trained midwife, where less than 200 women are employed such room and the services of a midwife must be furnished by the employer when necessary

---

[3] Twenty Fourth Annual Report, Commissioner of Labor, vol. ii.

While these regulations here are given as a type, apparently only the commissions of Petrograd Moscow and the Warsaw provinces require maternity wards in factories, and the regulations by different commissions vary considerably in detail The factory owners are forbidden by the law of 1866 from charging their employees for this hospital service. There is a tax in sixteen of the large industrial centers of Russia, which is a hospital tax on the wage earners, and in return for this tax the wage earners obtain the right of free medical treatment in hospitals not only for themselves, but also for their minor children In Petrograd there are sufficient municipal hospitals so that the factories are relieved of their responsibility in this matter Moreover, the employees are not taxed as in other cities and because they have no right of free medical treatment in the municipal hospitals the factory owners are required to meet the cost of treatment of their employees in the hospitals and the factory physician must visit the factory at stated intervals, for the factories are required to provide for treatment of outside patients by a physician as well as an emergency ward for first aid. Besides the daily visits to the factories employing over 1,000 persons the factory physician must treat the patients at his house or at their houses

In the rural parts of Russia there has developed a system of state medicine under the zemstvos, which are equivalent to our board of overseers of each county, and are elective in character These zemstvos have established hospitals presided over by physicians who are men or women, with whom there are nurses and feldshers, and midwives These give the entire medical care free to the peasant population of the district. The well-to do nobles employ other physicians or the same physicians on a fee system Thus it seems that 90 per cent. or more of the people of Russia are cared for under a system of free state medicine Often there is a combination between the special factory hospitals and the establishment funds and the zemstvos supplying hospital and medical facilities to the employees of the establishment funds The Russian system of compulsory health insurance, therefore, seems to be a combination of establishment funds, especially in the urban districts and a rural system of free state medical service This, in practice seems to give excellent results

Norway—In Norway when the workmen's insurance against accident was considered compulsory sickness insurance was also recommended This however, was not adopted until some years later The organization of that is a series of district or communal organizations with a central state body This state organization has an equalization fund taken from part of the contributions for the state which protects the different communal societies against excessive sickness and mortality losses The societies pay benefits for the first six months of illness with not more than thirteen weeks in the second half year if sickness continues that long Industrial and agricultural workers are included, as well as unskilled laborers and inland sailors under certain conditions, but the insured must have been employed at least six days, which excludes a certain number of day laborers But if these are not insured under the sickness insurance, they are provided for under the accident insurance law Seamen engaged in foreign trade are excluded, but sailors engaged in coastwise trade are included, even though they visit foreign shores for a period of ten days The workmen pay six tenths of the cost under this law, the employer one tenth, the state two tenths, and the commune one tenth For voluntary insured persons, not included under the compulsory section, the workman pays seven tenths, the state two tenths, and the commune one tenth All disputes between societies, workmen and employers are settled by a jury of those chosen by the communal authorities for three years, one a member of the committee, one an employer, and one a workman These decisions may be final or appealed to the Royal Institution of Insurance In case of questions of law, the appeal goes to the courts If a commune is a party in the case, the appeal goes to the Commission of Royal Insurance About 1,000 000 persons are insured under this law Besides this state law, there are some mutual insurance societies in Norway not under the state commission

Germany—Just prior to the passage of the sickness insurance law in Prussia, statistics show that 839,602 members belonged to registered friendly societies, 220,000 to miner societies, and about 200,000 to nonregistered friendly societies Only about half of those for whom the insurance law was intended had availed themselves of its protection

In the sickness insurance law first passed in 1883 no attempt was made to centralize control It apparently was realized that it was wisest to utilize existing agencies as far as possible The aim sought was mutual insurance with self-administration, and the development was through the already existing societies, and the various associations composed of members of the same trade or locality best lent themselves to this purpose Eight distinct classes of society, each absolutely independent of the other, were recognized the only common requirement being that they should make annual reports and conform to provisions of the law with reference to minimum benefits and methods of investing funds[4]

1 Communal societies (*Gemeindekrankenkassen*) These were not really societies but local institutions, founded by the authorities and required to accept all, of whatever occupation, who were obliged to insure but did not belong to any other sickness insurance society

2 Local societies (*Ortskrankenkassen*), established by townships, for the various trades, two or more townships often uniting to form one society At present the most popular of all because of their elastic management

3 Factory societies (*Betriebskrankenkassen*), created by proprietors of factories in which more than fifty workers are employed, particularly in trades in which the risk of sickness or accident is high Management is under the joint control of the workingmen and the employers

4 Builders' societies (*Baukrankenkassen*) which are practically establishment funds founded by contractors in building operations and in public works because of the great risks of these trades

5 Guilds, sick-clubs, or trade societies (*Innungskrankenkassen*), authorized by the national trades regulation law These do not possess legal personality, but are considered a mere function of the guilds or trade unions

6 Miners' societies (*Knappschaftskassen*), formed in accordance with the mining laws of the several kingdoms

7 Voluntary mutual aid societies (*Hilfskassen*) These are the friendly societies supported and controlled solely by members without any participation by employers Membership is usually without regard to trade They are not under the control of authorities except that they must grant the minimum benefits required by law

8 Independent state societies (*Landesrechtlichehilfskassen*) These are voluntary associations, organized under the auspices of certain kingdoms of the empire

The act of 1911 included the two large groups of domestics and farm hands which led to the establishment of a new type of so-called rural fund, which is also a local fund for workers mutual sickness societies exist to which both employers and employees must contribute, medical attendance is furnished and medicines and sick benefits to disabled members, and in case of death, relief to their families Cash benefits or annuities to widows and orphans or dependent parents may also be paid Assistance for wives and children of members called into the territorial or reserve military services may also be provided, and special pensions for widows and orphans of such deceased members

---

[4] Frankel and Dawson Workingmen's Insurance in Europe.

These obligatory societies are maintained by deductions from wages which must not exceed 2 per cent of the wages nor $9 60 per year, by payments by the employers of a sum equal to one-half the aggregate amount paid by members, by subsidies from the government, by sums donated or bequeathed by charitable persons, and by fines incurred for infringement of rules or regulations The government looks on these societies with great favor In 1907 about 6,000,000 wage earners were thus protected, leaving probably an equal number of the industrial workers of France still uninsured against sickness

Switzerland—Switzerland, having passed its law of subsidized sickness insurance in 1912, has the latest and best law of this type According to Rubinow, the Swiss law not only aims to stimulate the formation of sick benefit societies but also to improve the nature of their service This law provides a schedule of subsidies adjusted to the extent of the society's activities, 67 5 cents for children under 14 and the same amount for each male adult, 77 2 cents for each female adult if only one of the two mentioned functions—sickness benefits or medical aid—is provided, and 96 5 cents if both features are furnished, and $1 06 if sick benefits are furnished for 310 consecutive days This subsidy may be increased in mountainous districts to $1 35 An additional subsidy of from $3 86 to $7 72 is given in cases of confinement The Swiss law further stipulates that sick benefits shall not be less than 19 3 cents per day It requires, also, that not less than three months must expire after entrance into the society before the new member may draw benefits, but a waiting time after falling sick must not be longer than three days, and the confinement benefits must be granted for at least six weeks The law also requires that the society shall be financially sound, and it prescribes a definite system of organization of medical and pharmaceutical help which prevents excessive cost of services and gives to the sick member a certain selection of physician This last factor of cost and choice of physician, we shall see later, has been the stumbling block in all countries

It has been a noticeable feature in the subsidized state insurance schemes that the rapidity and energy of their growth seems to have been in ratio to the subsidies obtained from the state Without state aid only the more thrifty and well-paid of the workers seem voluntarily to insure, and many of these often are unable to keep up their insurance, and drop it As long as the state held aloof and simply regulated the control without giving assistance, the growth of this voluntary insurance has always been slow The more the state has given assistance, the greater has been the number of workmen who have been able to obtain the protection they seek After twenty-five years' experience in various voluntary forms of sickness insurance, subsidized or not, several nations in Europe have realized that the logical conclusion was compulsory state insurance in which workmen and employers alike contributed and the state assisted with amounts sufficient to insure the payment of the management of the huge machine The ratio of those insured to the total population is interesting, comparing it in the countries of voluntary insurance and compulsory insurance.

Denmark has a total population of 2,757,000, insured 710,000, which is 25 8 per cent of the population In France the 6,000,000 insured equals about 10 or 12 per cent of the population, in Great Britain the 14,000,000 insured of the 45,000,000 population is 31 per cent of the population In Germany, in 1912, there was a total population of 64,000,000 and there were 19,000,000 insured, giving about 31 per cent insured It is very noticeable that five countries of Europe between 1909 and 1912 passed acts of compulsory insurance Norway in 1909, Serbia in 1910, Great Britain in 1911, Russia in 1912, and Roumania in 1912

In discussing workmen's compensation last year, it was shown that 6 per cent of the industrial workers suffered from accident during the year, and it was also stated that from 40 to 50 per cent suffered from some form of sickness It was shown last year how clearly certain occupations increased the liability to accident, and attention was drawn to a table published showing the influence of sex and occupation on certain diseases Every important occupation has its own definite sickness rate This is outside of the so-called well recognized occupational diseases These two tables are published in page 39 of the Judicial Council Report for 1915

In the Report on Sickness Insurance of the Committee for Immigrants of America, discussing these same tables, it is shown that the data coming from the Leipzig sick fund eliminate the variations produced by race, sex and age The industrial factor is isolated and is evidently a strong one The variation between industries is less marked than in the case of accidents All excess of sickness found above the minimum rate of those of office employees can be charged in a great measure to industrial conditions For example, if the chance of taking sick is only 21 per cent. for office employees, for men, and 21 4 per cent for women, and in hotels and restaurants the rate is 32 5 per cent for men and 40 9 per cent for women, and the annual loss of days through sickness per person is, for the office employees, 5 8 for men and 7 for women, and for hotels and restaurants it is 8 days for men and 12.2 for women, then the extra 2.2 days' loss per person per year for men and 5.2 per person per year for women can be justly laid to the difference in the environment of those working in hotels and restaurants and those working as office employees The loss, therefore, should be distributed as in accident insurance, so that the industry may bear its just share and the state not only accept equal responsibility for sickness as for accidents to assist those who need it It would also seem that there was equal justification for such aid as that in which the states and municipalities now accept the responsibility of spending large sums in preventive hygiene, as seen in health department work, and also large sums in public hospitals and dispensaries

COMPARISON OF METHODS ABROAD

To understand compulsory insurance and its workings, a comparison of the methods of Norway, Russia, Austria Hungary, Germany and Great Britain will give the clearest idea

Russia—The mining industry was the first one of the great industries to develop in Russia, and as long ago as 1806 there was a law requiring proprietors of mining and metallurgical industries to establish hospital facilities for sick or injured employees, and many of these establishments were owned by the state or crown This idea was developed further in 1866 when an epidemic of Asiatic cholera broke out in Moscow The governor of Moscow, considering the large factories where the insanitary conditions and large number of workers were the means of spreading the cholera epidemic, in a letter to the minister of the interior requested that they be required to establish hospitals and employ physicians in connection with their industrial hospitals The law of 1866, therefore, provided that there should be established in connection with each factory employing 1,000 workers a hospital with ten beds, and at each factory employing more than 1,000 workers fifteen beds or more, and at each factory employing less than 1,000 workers five beds or more at the rate of one for each hundred workers Although this law was declared to be a temporary measure, it is still in force The establishment funds connected with all large industries in Russia are based on the existence of this original order of the emperor

Outside of the city of Moscow the following regulations established by the provincial factory commission is given as a type[3] Factories employing 500 or more workmen are required to have a factory hospital with one bed for each hundred workmen, a resident physician and a "feldsher," who is a medical assistant of higher grade than a trained nurse When the number of workmen exceeds 3,000, two physicians must be employed, one of whom must reside at the factory Factories employing from seventeen to 500 workmen may make arrangements with the zemstvo hospi-

---

[3] Twenty Fourth Annual Report, Commissioner of Labor, vol ii

In the *Bulletin* of the United States Bureau of Labor, which gives this law in full, it is shown that the title of the act is to provide for the insurance against loss of health and for the prevention and cure of sickness and for insurance against unemployment, and for purposes incidental thereto. Under its provisions health insurance is compulsory on all employed persons aged from 16 to 70, except those in the naval or military services of the crown, those in other employment under the crown or under local or other public authorities for whom adequate provision already exists, employees of railway companies and the like provided for by suitable benefits, teachers provided for under other acts, etc. Those affected by the exceptions are comparatively few, and may, in the discretion of the insurance commissioners, be transferred to the compulsory insurance scheme. Persons who are not subject to the compulsory insurance mav voluntarily insure if they are engaged in some regular occupation and are wholly or mainly dependent for their livelihood on their earnings in such occupation or have been insured persons for a period of five years or upward, no person may become a voluntary contributor whose annual income from all sources exceeds $778.64, that is, 160 pounds, unless he has been previously insured for a period of five years or upward. There is no discrimination in respect of sex or of citizenship, but all insured persons must be residents of the United Kingdom.

TABLE 2.—AVERAGE NUMBER OF CASES OF SICKNESS FOR BOTH SEXES PER HUNDRED INSURED IN SICKNESS INSURANCE SOCIETIES, 1888-1907 *

Sex	Communal	Local	Factory	Building	Guild	Mutual Aid	Independent State	Total
Men	27.3	37.5	44.7	58.3	34.4	37.3	31.2	38.0
Women	22.2	33.6	37.4	47.3	26.6	33.7	28.8	32.1

* Frankel and Dawson. Workingmen's Insurance in Europe, Table 71.

The standard rates of insurance are 14 cents for men and 12 cents for women. This amount is made up of contributions from employer, employee and public funds, the amount paid by each depending on the insured person's rate of wages. If this reaches or exceeds 60.8 cents per working day, the employer pays 6.1 cents, male employees pay 8.1, and female employees 6.1 cents per week, nothing being contributed from the public funds. If the rate of wages falls between 49 and 61 cents a day, the employer pays for male employees 8 and for female employees 6 cents a week, and the employee, regardless of sex, pays 6 cents. When the rate of wages is between 37 and 49 cents a day, the employer pays 10 cents per week for men and 8 cents for women, the employee pays 2 cents, and 2 cents is contributed from the public funds. When the rate of wages does not exceed 37 cents a day, the employer pays for men 12 and for women 10 cents a week, the employee pays nothing, and 2 cents a week is provided from the public funds. These provisions relate only to employees of the age of 21 or upward. Employers are authorized to make payments in behalf of their employees and to deduct the employees' contributions from any wages payable by them to such employees. Contributions by voluntary contributors are made at rates fixed in accordance with a table prepared by the insurance commissioners and are payable weekly or at other prescribed intervals by the contributors themselves. No contributions shall be payable in behalf either of employed persons or of voluntary contributors after they have attained the age of 70 years.

A central administrative body known as the insurance commissioners was created as a body corporate, with the power to appoint officers, inspectors, referees, etc., subject to the approval of the treasury. An insurance committee was also constituted for every county and county borough, its membership consisting of not less than forty nor more than eighty persons, some of whom must be women. These committees are authorized to subdivide the counties or boroughs into areas over which district insurance committees shall have supervision and are required to make reports as to the health of insured persons and the conditions affecting the same within their respective counties and county boroughs, and also to disseminate information on matters relative to health, cooperating, if thought best, with local educational and other institutions. Causes of excessive sickness may be inquired into at the instance of insurance commissioners or of an approved society or by an insurance committee, and where such excess is due to neglect or insanitary conditions the costs of any extra expense may be demanded from the persons chargeable with such neglect, and an inquiry may be made by a special appointee of the secretary of state or local government board to determine as to the facts in the case and the justice of such claim.

The administration of the sickness, disablement and maternity benefits is committed, in the case of insured persons who are members of an approved society, such as friendly societies, trade unions, provident societies, etc., to the societies of which they are members, which societies are also charged with the duty of receiving contributions of their members in this behalf. Medical and sanitary benefits are administered through the insurance committees described below. This separation of the bodies administering the medical benefits from those administering the sick cash benefits has been the cause of serious administrative trouble. Persons not members of an approved society may pay their contributions through the postoffice, the fund thus created being subject to the control of the insurance committees.

There is a second part of compulsory insurance providing for benefit in cases of unemployment in certain trades. The board of trade administers this portion of the act, and the list of trades may be extended by this board. At present there are seven in number: building, including the construction, alteration and demolition of buildings, construction of works, including railroads, docks, harbors, canals, etc., shipbuilding, mechanical engineering, including the manufacture of ordnance and firearms, iron founding, the construction of vehicles, sawmilling, and machine woodwork. Employers and workmen pay equal shares of a weekly contribution of 10 cents for this form of insurance. While Parliament contributes annually a sum equal to one third of the total contributions received from employers and workmen during the year, in general the employer is expected to pay the contributions of both himself and his workman, deducting the workman's portion from wages payable to the latter.

Applicants for benefits under this branch of the act must show they have been employed in an insured trade in each of not less than twenty-six separate calendar weeks in the preceding five years, that they are capable of working but unable to obtain suitable employment, and have not exhausted their right to benefits under this part of the act. Workmen are not required to accept employment in place of striking workmen, or at a lower rate of pay than is customary in their line of employment in their district. Where, however, the employment is lost by reason of a stoppage of work due to a trade dispute in the establishment in which the workman was employed, he can receive no benefits so long as such stoppage of work continues unless he has during such stoppage become actively employed elsewhere in an insured trade. Workmen losing employment through misconduct, or voluntarily leaving employment without just cause, may receive no benefits for a period of six weeks from the date of such loss of employment. The benefits payable in cases of unemployment begin after the first week of the period of unemployment, and are fixed at $1.70 per week unless some other rate is prescribed. Employment benefits are not payable for more than fifteen weeks within a period of twelve months unless some other benefit period is prescribed, nor shall workers in general receive any unemployment benefit in excess of one week's benefit for every five contributions paid by them under the act.

Duration of Sickness	Per 100 Cases of Sickness Males	 Females
From fourteen to twenty five weeks	3.5	5.7
Twenty six weeks and over	2.3	2.8

* Twenty Fourth Annual Report Commissioner of Labor, vol. 1.

of a lower wage scale Out of some 20,000,000 insured, about 7,500,000 are insured in local funds, another 7,500,000 in rural funds, and 3,000,000 in establishment funds, leaving only 2,000,000 for all other forms of funds Membership in mutual aid funds, which are equivalent to the friendly societies or fraternal orders, as a substitute for insurance in the compulsory institutions is only tolerated and at the price of forfeiting the employer's contribution

Contributions to voluntary societies are not fixed, but those to the communal societies are limited by law to from 1 to 2 per cent of the daily wages of daily laborers In others, contributions must not exceed from 3 to 4 per cent of the same In this the workingmen pay two thirds and employers one third. In practice, employers pay all and deduct the proper amount from wages This method avoids all necessity for collectors, contributions both of employers and employees being turned over to the societies at convenient intervals

The employer must enforce on his men the duty of insuring The workingman may or may not insure, as he pleases But whoever employs an uninsured workingman renders himself liable both to a fine and to the payment of all costs in case of sickness or accident In such cases the communal society of the district assumes the entire care of the employee gives medical care, and gives the usual cash benefit during disablement, for all of which the employer becomes liable to the society

Frankel and Dawson further draw attention to the strong tendency toward the disappearance of smaller societies by consolidation into larger central organizations, and in Leipzig and Dresden, where the sickness societies have merged into one local organization, the work is most effectively carried out The administration of a single large society has proved much more economical than in the numerous smaller societies displaced In 1907 there were 23,271 total societies with 8,972,210 men and 3,166,757 women members Table 1 shows the percentage and duration of sickness and the percentage of deaths in sickness insurance societies from 1888 to 1907

* Frankel and Dawson Workingmen's Insurance in Europe, Table 70

In Division 1 of this table there is a steady progressive increase in the amount of sickness in the period under observation, women enjoying more freedom from sickness than men not only in the total but also in each type of society This is probably due to the greater risk of accident in the trades in which men are employed, because for the first thirteen weeks the sickness society cares for both accident and sickness It is also due to the higher average age of the men The number of cases of sickness among the two sexes, as shown by Frankel and Dawson, differs considerably with the type of society

It is evident that the average duration of sickness, in the division of Table 2, so-called, has also increased, showing longer periods This is so marked that in spite of the fewer cases of sickness, the duration of sickness per member each year is greater than among the men This is probably due to the fact that the cases of brief duration are almost twice as numerous for males as for females, the cases of sickness of longer duration (lasting over three weeks) show the contrary

Austria-Hungary—Austria-Hungary follows closely the plan of Germany Previous to the passage of the compulsory law, Austria also had had large establishment funds and voluntary organizations, in some of which the employers were contributing, in some only the workmen, and in some instances both The number of workmen thus insured was relatively small, for there were only about 300,000 members in 748 societies, and the benefits given were inadequate to meet the situation All workmen and working women are included, as well as the employees in all branches of industry, trade and transportation, those engaged in navigation, forestry, agriculture and home industries, as well as those employed by the states and communes, may insure voluntarily Trade guild societies, private friendly societies and miner's societies which were willing to grant the minimum benefits of the new law, were continued District, building, trade and factory societies were distinctly the creations of the compulsory law The following six types of societies are recognized

1 District sickness insurance societies (*Bezirkskrankenkassen*) which, like the local and communal sickness societies of Germany, correspond to geographic districts

2 Factory sickness insurance societies (*Fabrikskrankenkassen*) organized by owners of large factories, not connected with trade guilds

3 Building trades sickness insurance societies (*Baukrankenkassen*), usually temporarily established by builders

4 Trade-guild sickness insurance societies (*Genossenschaftskrankenkassen*), corresponding to Class 5 of the German system

5 Private friendly societies (*Vereine*)

6 Miners' societies (*Bruderladen*)

To these original six classes there have since been added mutual sickness insurance societies comprised chiefly of employees, and there is also an eighth class—societies composed of apprentices The latter are offshoots of the trade-guild sickness insurance societies and are associated with them

In all organizations, except in the private friendly and miners' societies, contributions of employers and workingmen amount to two thirds and one third, respectively In private friendly societies, the employers need not contribute at all, and in the miners' societies only as required by separate statute In practice, the employers' friendly societies do more than the law requires, paying more than the legal proportion in the various organizations As in Germany, it is obligatory on the employer to enforce payments of workingmen If a newly engaged employee does not already belong to some society, the employer must report his name to the authorities not later than three days after work is begun For each neglect to do this, he may be compelled to pay a fine of about $5 and suffer imprisonment for two days

The system of sickness insurance is less developed in Austria than in Germany In Austria the first four weeks of accident insurance are taken care of by the sickness societies, and in Hungary the first ten weeks

Great Britain—In Great Britain, previous to 1911, insurance was carried on by so-called friendly societies, the membership of which was made up of the able-bodied active workingmen of England

The most complete and most recent scheme of social insurance is the national insurance act of Great Britain, of 1911

In the *Bulletin* of the United States Bureau of Labor, which gives this law in full, it is shown that the title of the act is to provide for the insurance against loss of health and for the prevention and cure of sickness and for insurance against unemployment, and for purposes incidental thereto Under its provisions health insurance is compulsory on all employed persons aged from 16 to 70, except those in the naval or military services of the crown, those in other employment under the crown or under local or other public authorities for whom adequate provision already exists, employees of railway companies and the like provided for by suitable benefits, teachers provided for under other acts, etc. Those affected by the exceptions are comparatively few, and may, in the discretion of the insurance commissioners, be transferred to the compulsory insurance scheme Persons who are not subject to the compulsory insurance may voluntarily insure if they are engaged in some regular occupation and are wholly or mainly dependent for their livelihood on their earnings in such occupation or have been insured persons for a period of five years or upward, no person may become a voluntary contributor whose annual income from all sources exceeds $778 64, that is, 160 pounds, unless he has been previously insured for a period of five years or upward There is no discrimination in respect of sex or of citizenship, but all insured persons must be residents of the United Kingdom

Duration of Sickness	Per 100 Cases of Sickness Males	Females
From fourteen to twenty five weeks	3 5	5 7
Twenty six weeks and over	2 3	2 8

* Twenty Fourth Annual Report Commissioner of Labor, vol 1

Provision is made for the determination of claims and the arbitration of disputes in both branches of the act It was estimated that there were 14,000,000 insurable persons in the compulsory class and approximately an additional 2,000,000 who could become voluntary members According to the Fabian Society report, only about 21,200 did actually in the first two years become voluntary members

The approved *societies mentioned* here are the various friendly societies equivalent to our fraternal societies and trade unions, provident societies and lodges, which had been giving sick benefit and insurance in England for so many years, and also specially approved societies of the Prudential Insurance Company called *into* existence to care for persons already insured in this company These societies differed from the German approved societies in that they were not necessarily confined to any locality or trade, but their membership was scattered through many trades all over the kingdom Some *contained women and men, some had lodges* of women and men separately, most were probably confined to men alone All these societies were actuarially independent

These approved societies[5] operating in 1914 in England ranged in size from the great centralized societies and the *great affiliated orders with many hundreds of thousands of* members down to the small village or local clubs whose membership in some cases did not exceed 100 Every conceivable variety or type of administration seems to be allowed Some societies are centralized both as to control and as to finance, some permit their lodges to control the funds, and some have a central body supervising and equalizing the funds that are managed by the local lodges This last method has given the best results The trade union societies are composed usually of workers engaged in one occupation or a number of allied occupations, and therefore the risk of the industry is relatively evenly distributed and constant In some of the big friendly societies, all trades are mingled together in one lodge and the uneven hazard of the various trades causes serious actuarial difficulties in the administration This lack of homogeneity in many of the societies and local lodges, the scattering of the membership of the societies all over the United Kingdom, has proved to be a real defect in the English law

ADMINISTRATION AND EXTENT OF BENEFITS

Sickness insurance, as is pointed out by Rubinow, is primarily a matter for local administration Political exigencies forced the British government to accept the friendly societies as approved societies, because it is doubtful if any bill could have passed against the opposition of five or six million members *of these friendly* societies, one result being the establishment of approved societies of private industrial life insurance companies the membership of which exceeds 4,000,000 It is doubtful *if this* use of the private industrial casualty companies was *contemplated* or expected in England Germany, *on the other hand, used the same* established funds and societies, but insisted on their localization either by trade establishment or geographic distribution The great advantage of localization is that the administration of benefits—both medical and cash benefits—is greatly simplified The establishment fund *is* less desirable because of the predominating importance of one employer and the financial danger which may develop out of one localized epidemic

Considering the benefits given in the various countries under the sickness funds, Austria insists that the benefits provided by a sick fund *must not be less* than the following From the beginning of a sickness free *medical* treatment, as well as free medicines and therapeutic appliances, as eye glasses, crutches, etc Medical treatment *includes* lying-in treatment. In case the sickness lasts *more than* three days and the sick person is unable to work, *he shall receive* a cash benefit equal in amount to 60 per cent of the current wages for ordinary day labor in that district, this cash benefit to be paid for a period of twenty weeks In cases of normal childbirth, sick benefit *is* to be paid for at least four weeks after delivery In case of death, the heirs shall be paid a funeral benefit not less than twenty times the rate of wages for ordinary day labor, as above The benefit is paid if the death occurs after the twenty weeks, provided the sick person has retained his membership in the sick fund by continuing payment of dues, *and if the* disability is caused by an accident covered by the *accident* insurance laws, the funeral benefits may be claimed both from the sick fund and from the accident insurance institution This rate of wages is revised from time to time, and under both sexes is rated as for adults and for young persons, that is, 16 years of age or younger Apprentices are rated as *young persons*

Hospital treatment may be given at the expense of the sick fund with the consent of the sick person, if the latter is living with wife or husband or with other member of the family in the household, or otherwise receiving home care, without the consent of the sick person when the nature of the sickness requires special treatment, in other cases regardless of whether the sick person consents thereto If a person placed in a hospital has dependents on him, the sick fund must provide the dependents with at least half the sick benefit. The sick funds are expressly prohibited from engaging in invalidity insurance or the insurance of widows and orphans

No sick fund can use as a basis for computing a sick benefit an average rate of wages lower than the official rate or higher *than 81 cents per day*, the sick benefit cannot exceed 25 per cent *of the* wage rate used as a basis for computation, and the benefits cannot be paid for more than a year, and the funeral benefit cannot exceed $20 30

The workmen and physicians have advocated free choice of physicians on the part of sick persons, but the funds have insisted on retaining the system of a corps of fund physicians, to any one of whom the sick person may apply for treatment. The compensation of the physician who is under contract with the fund is in the form of a fixed salary or in the form of a salary varying with the membership of the fund, although occasionally in the form of a fee for services in each individual case In rural districts where there is a scarcity of medical practitioners, there are other *systems of payment in vogue* Any expense which *may be caused through the treatment of a member by any other than a fund physician will* be reimbursed by the district sick fund only if the treatment has taken place at its order or by direction of the board of directors in case of emergency

In Germany the sickness insurance includes the first thirteen weeks of accident insurance Such accident must have taken place in the course of the employment, it must have befallen an insured person, and the death must have a causal connection with the industrial accident The term "sickness" is defined to be an abnormal condition of health to remove which *necessitates medical attendance and medicine* The period of convalescence following a sickness is not properly sickness, but when there is a recurrence of sickness during the convalescence, the disabled person becomes entitled to relief Thus the sickness insurance in the first thirteen weeks provides benefits for both the disability of sickness and accident As a measure of administrative convenience, maternity benefits paid in case of normal childbirth are provided for by the sick funds, in other words, maternity insurance has been combined with sickness insurance If childbirth is not *normal,* it is a basis of claim to the regular sick benefits The cost of burial of insured persons is defrayed by the funds, but not by the communal benefits

The minimum benefits provided by the sickness insurance *system consists* of medical attendance, medicines and therapeutic supplies, and from the date the sickness or disability begins, regardless of whether it causes inability *to continue* working If the sickness or disability prevents the insured workman from continuing work, he must be granted a pecuniary benefit which must not be less than *half the rate* of wages paid in the locality for ordinary unskilled *day* labor, this benefit to be paid for disability of not *less than* twenty-six weeks and not more than fifty-two A pecuniary benefit of the same amount is paid for six weeks after the date of confinement to a female insured person in case of childbirth, and funeral benefit of *twenty* times the rate of wages in computing the benefit, but not less than $11 90 *A person* included *in* both the sickness and accident insurance, who is disabled by industrial accident, receives sickness insurance for thirteen weeks and in addition receives, at the beginning of the fifth week, the accident benefit If, at the end of thirteen weeks, the disabled person has not recovered, the accident insurance or other associations then provide the regular accident benefits A person included in both sickness and invalidity insurance, who is disabled by sickness, receives the regular sick benefit for a period of twenty-six weeks If he has not recovered at that time, the invalidity insurance institutes then provide the regular invalidity benefits If there is good reason to believe that by special courses of treatment a person disabled either by industrial accident or disease, causing extended invalidity, can be restored to health, then the agencies conducting the invalidity insurance are authorized to relieve the sick fund of the care of the disabled person and provide the treatment at their expense, or they may authorize the sick fund to provide such treatment at their expense A pecuniary benefit, but not the medical benefits, may be refused by the sick funds if the disabled person has purposely caused the sickness or accident, or if the disability results from rowdyism or similar misconduct, or results from intoxication

---

[5] Report of Departmental Committee on Sickness Benefit Claims Under National Insurance Act, 1914

The services of physicians are to be provided in accordance with the regulations established by each fund The usual plan is for the fund to make contracts with a number of physicians who give their services in return for an annual sum fixed in advance or for a specified sum per patient also fixed in advance That is, in Dresden the physicians are under stated salaries, or, as in Leipzig, there may be a capitation fund of a stated amount divided according to services rendered to each patient, each medical service rendered counting so many points, that is, a day visit one point, a night visit two points, etc. In no instance is a charge fixed on the number of visits or number of prescriptions Many of the sick funds, as in Leipzig, make contracts with a large number of physicians, and the insured persons may choose among them In Leipzig the fund employs the services of 80 per cent. of all physicians in the city, while other funds, in order to secure through competition low rates of fees from physicians, provide only the services of a limited number of physicians The competition among physicians to secure the position of medical officer has reduced the cost to funds to a very low level, but on the other hand it has caused intense quarrels between physicians and the funds Such disputes were discussed last year in the case of the Leipzig and Cologne societies The determination on the part of the sickness funds to control the physicians and the resentment on the part of the physicians to such control is shown in the number of disputes that continually arise Up to 1911 in some 1,020 disputes, 961 have been decided in favor of the physicians There is no question that some control, either medical or lay, must be exerted over the carrying out of any insurance scheme It is also unfortunately a fact that a small percentage of all professions is dishonest and such dishonesty must be controlled

In Leipzig the control of the medical service is brought about through the following committees* a representative medical committee of the society doctors, a conciliation committee and an arbitration committee The representative medical committee of the society doctors consists of twelve members chosen every two years by the doctors in the service of the society, four deputy members being elected at the same time to take the place of members who cease to hold office. A quorum of the committee consists of the chairman or vice chairman and not less than six members Clerical work is provided for by the society if required by the committee The duties of the committee relate primarily to the constant supervision and control of the society doctors, also to calculating and dividing the remuneration of the doctors and to the maintenance of their rights and interests The committee controls all the accounts of the doctors after they have been checked so far as the figures are concerned at the office of the society The committee sees that the charges are right and reasonable, amounts in excess of what should be charged are deducted, and it supervises the prescriptions of the doctors for drugs and other medical and surgical requirements, medicinal baths, etc. After audit of the figures and statistics of the society, the committee judges whether or not the prescriptions are economical, whether they are within the limits fixed, and whether proper provision is made for reuse of bottles, etc The committee objects to the use of secret remedies, and deducts from the remuneration of the doctor for the benefit of the society, the amount of charges which should not have been incurred

The committee supervises the number of persons certified by each doctor as unable to work and the length of time of the inability, according to statistics prepared by the society The committee determines whether there has been an improper excess of the normal average In case of serious default, such as wrongly certifying patients as unable to work, the society deducts from the remuneration of the doctor, for the benefit of the society, the excess charges incurred The committee communicates semiannually to all society doctors the results of the statistics prepared to which reference has been made above If the committee finds that a doctor has been seriously at fault in the foregoing matters, it may take one of the following actions, in addition to making the deductions from the doctor's remuneration give advice or written warning, after two unheeded warnings, temporary suspension for from one to twelve months from attendance on society patients Before giving warning of suspension, the doctor concerned must be heard If a doctor has been twice temporarily excluded from the society practice without result, and if the society does not give the doctor notice to terminate his contract, the committee may make a request to the Arbitration Committee that the doctor be permanently excluded from society practice Complaints made by a patient or by the society with regard to the practice of a doctor are to be brought before the Representative Medical Committee for its opinion The opinion on the case is to be communicated to the doctor by the committee The rights of the society with regard to giving notice to terminate a contract are not affected by any action under this provision The society has to prepare for the committee all the information necessary for the duties imposed on it by the foregoing rules Circulars and directions which the society proposes to issue to its doctors are first to be submitted to this committee for its information Complaints by the doctor against the society have first to be submitted to the committee which gives an opinion to the doctor on the complaint Complaints by doctors of members of the society have to be communicated to the committee only if the managing committee of the society does not give satisfaction to the doctor in regard to the complaints

The Conciliation Committee is appointed for deliberation on questions which appear to require consultation between the society and its doctors, and for the friendly consideration of all kinds of differences This committee consists of two chairmen, two deputy chairmen and one member each, to be chosen for a year, of the managing committee of the sickness society and of the Representative Medical Committee The deputy chairmen act as deputies for the chairmen Persons specially appointed for the purpose, and for the same term of office, shall act as deputies for the deputy chairmen and for the other members Either one of the two chairmen may call a meeting of the committee Resolutions are valid only if all six members or their respective deputies are present and if at least four votes are cast for them

The Arbitration Committee is composed of nine members The chairman of the managing committee of the sickness society, the deputy chairman, and one other member of the managing committee chosen by the committee for a year, are the members of the Arbitration Committee. Three other members of the managing committee are chosen in case any of the other three are prevented from doing so The chairman of the District Medical Association of Leipzig Town, the District Medical Association of Leipzig Rural District and the Representative Medical Committee are also members of the committee, and each of these are represented by his deputy chairman if the chairman is prevented from acting To these six representatives of the society and of the doctors are added two members of the royal district government, and the medical councilor of that authority for the district. The material expenses of the Arbitration Committee are borne by the doctor whose appeal is being considered if his appeal is not upheld, if his appeal is upheld, by the two doctors' associations and by the society in equal shares

---

* Gibbon Medical Benefit in Germany and Denmark.

The Arbitration Committee meets on the invitation of the local royal insurance authorities on their premises A member of this local insurance office is chairman Five members are a quorum and resolutions are valid if passed by a majority If the votes are equal, the chairman shall have a casting vote The Arbitration Committee decides definitely on matters referred to it in accordance with the agreement of Dec 31, 1910, or in accordance with individual agreements made with the doctors, or on such matters as may in future be referred to it, also on appeals against measures taken by the Representative Medical Committee, also, on any proposal for permanent exclusion of a doctor, or for any change of the present stipulations The committee also decides definitely on the interpretation of the various provisions of the agreement or agreements with the individual doctors, or of these conditions The ordinary courts of law decide disputes which may arise in regard to remuneration and claims of those doctors who are employed at fixed salaries These agreements are to remain in force until the end of 1916 and then continue in force for another year, unless a written notice to terminate the agreement is given by the society or by the district medical association, and the notice must be submitted to the Arbitration Committee for an expression of its opinion The Arbitration Committee may decide to make its decisions public, but not decisions which touch the failure of duty or other personal circumstances of a doctor, or which, if published, would touch the interests of a third person All appeals to the Arbitration Committee, to prevent their being excluded, are to be made to the chairman of the committee within four weeks after the decision against which appeal is made has been communicated to the doctor

LEIPZIG REGULATIONS

The following extracts from the regulations relating to the medical practitioners of the District Sickness Society of Leipzig are given as being useful for reference in compiling such regulations[6]

The Representative Medical Committee has to take notice, not only of contraventions of the terms of the agreement itself, but also of the regulations relating to doctors

Medical Treatment—If it is not clear from the membership book that the insurance contributions have been made in respect of the person up to the date on which medical assistance is sought, or if the receipted membership book cannot be produced, the doctor shall give to the person requesting treatment such primary treatment as may be necessary, if there is any danger in delay, but any further treatment, especially the giving of a prescription or a sickness book, shall be expressly contingent on the production of receipts in the membership book

The treating doctor shall enter in the sickness card of the membership book the date of every first consultation, and, if possible, the date of every last consultation (or visit) Medical attendants at polyclinics shall do likewise

Change of Doctor—Patients may change their doctor in the course of an illness only with the consent of the society The society shall not exercise any influence in the choice of doctor, and, if a change of doctor is approved, shall at once inform the doctor changed, with a statement of the reasons for the approval, according to the provisions of these regulations The sending of a patient by one doctor to another society doctor does not require the approval of the society, but the change must be noted in the membership book and, if the patient is unable to follow his employment, in the sickness book

The following rules shall apply to the granting or refusal of approval of a change of doctor

1 Approval shall be given to the change of doctor by a member or dependent

(*a*) If the society doctor refuses to continue the treatment of a patient and does not send him to another doctor, or if the patient does not wish to go to a proposed doctor

(*b*) If the patient cannot be required to retain the same doctor because of the change of address of the doctor or of the patient, or of a change in the consultation hours

(*c*) If the doctor who has given the first attendance in the case of an illness resides so far away, or his consultation hours are so inconvenient that there would be undue difficulties to the patient in being attended by him

(*d*) If the contemplated change is from a general practitioner to a specialist, or from a specialist to a general practitioner

(*e*) If change of treatment is contemplated, more particularly when the doctor advises a course of treatment or an operation which the patient rejects

(*f*) If the deputy of the treating doctor does not possess the confidence of the patient

(*g*) If the treatment has continued for a long time without apparent result (to give ease of mind to the patient)

2 In addition, change of doctor shall be approved in the case of members who continue at work and of dependents

(*a*) In case of differences between the doctor and the patient (in order to prevent further difficulties)

(*b*) In all other cases in which the foregoing conditions seem to exist (In doubtful cases, the approval shall only be given after inquiry has been made of the treating doctor, and, in suitable circumstances, also only after a certificate has been obtained from a confidential medical adviser)

3 Approval to change of doctor shall be refused

(*a*) If the patient is not satisfied with the prescriptions of the doctor, or if he desires particular drugs or other means of cure.

(*b*) If the patient has made improper proposals to the doctor

(*c*) In the absence of any adequate reasons

4 In addition, approval to change of doctor shall be refused in the case of members who cannot follow their employments

(*a*) If there is suspicion of malingering

(*b*) While examination by a confidential medical adviser is pending

(*c*) In case of dispute with the doctor as regards inability to follow employment (In these cases the patient shall be speedily examined by a confidential medical adviser The result of the examination shall be immediately communicated to the treating doctor If the result agrees with the diagnosis of the latter, the refusal to a change of doctor shall hold good Otherwise approval is to be given to the change)

The following cases are not considered to constitute a change of doctor and do not require approval

(*a*) If at the commencement of an illness, notwithstanding repeated requests, the doctor does not attend and the patient goes on to another doctor

(*b*) If a patient, in consequence of a sudden change in his condition and inability to obtain readily the services of the treating doctor, obtains the services, for the time, of another doctor

(*c*) If a doctor discharges a patient from his care as cured and the latter still considers himself ill (If a patient in such a case is certified as unable to follow his employment by the new doctor, he shall forthwith after receipt of his sickness book be examined by a confidential medical adviser

The Sending of Patients to Hospital—The doctor shall send sick members to hospitals, etc., (even against the will of the member in the circumstances set out in Section 12, Part 3, of the rules of the society) in cases of

1 Illnesses which require long surgical attention or serious operations

2 Illnesses of all kinds when, because of the conditions of the dwelling place and the like, treatment in a hospital is desirable

3 Infectious venereal diseases, especially if the patient is unable to follow his employment

4 Enteric fever, cholera, smallpox, scarlet fever, diphtheria, epidemic cerebrospinal fever

5 Suspicion of malingering

6 Request of the managing committee of the society

Members who, according to Section 12, Part 3, of the rules of the society, have the right to refuse hospital treatment may be treated in their homes, after the advantages of hospital treatment have been repeatedly brought to their notice Since patients who have not the right to refuse hospital treatment lose their claim to money benefit in case of refusal, the doctor must forthwith report to the society any such case of refusal

Members who are declared able to follow their employment but who assert that they are still unable to do so are as a rule to be sent to hospital for observation if they so desire

Request for reception into a hospital has to be made as a rule to the administration of the society As an exception members may be sent directly to a hospital when there is danger in delay as at times when the offices of the society are closed The necessity for conveying the patient by ambulance or carriage is to be indicated on the certificate

Dependents of members cannot compulsorily be sent to a hospital, but, in circumstances such as those mentioned above the doctor shall also in these cases endeavor to persuade such patients to go to a hospital

When patients are recommended to go to a private clinic, they shall be informed that treatment in a public institution is without charge to them, but that they have, as a rule, to pay (in part) for treatment in a private institution

---

[6] Gibbon Medical Benefit in Germany and Denmark.

Certification of Inability to Follow Employment—Care is to be exercised in determining the first day when the patient is able to resume work, and, in doing this, account is not to be taken of the first day of the week, but the first day shall be certified which succeeds the last day of inability to follow employment, even when the day is a Sunday or a holiday

Sickness Book— If there is any suspicion of malingering, the patient shall as a rule not be allowed to go out, at least not beyond the visiting of the doctor during his consultation times, in suitable cases, the patient is to be ordered to remain in bed

In recording diagnosis, general indications are to be avoided as much as possible—for example, recording simply lead poisoning, nervous disease, stomach trouble, throat trouble, kidney disease, abdominal complaint, venereal disease Occupational accidents are to be indicated as such

During the continuance of inability to work, the doctor shall give to the patient, after examination, a certificate of sickness at the end of every week as a rule not before Friday

Control Inquiries—The time and place of the control inquiries respecting patients unable to follow their employment will be communicated to the treating doctor beforehand, and it is permitted to him to attend If he, the treating doctor, does not agree with the results of the inquiry and is not satisfied with the action taken by the society, he shall inform the latter of the grounds of his objections If an agreement cannot be reached between the confidential medical adviser and the treating doctor, the patient shall be sent by the society to a medical arbitrator, whose decision shall be final These arbitrators shall be annually appointed by the committee of the society in agreement with the Representative Medical Committee, and an arbitrator and a deputy shall be appointed for each specialty in which question may arise

The services of the arbitrator may also be requisitioned by the society in cases in which a member who has been certified able to work strongly declares his inability, and this notwithstanding that the treating doctor and the confidential medical adviser agree on the case.

ADDITIONAL BENEFITS

The insurance of dependents mentioned here ranks among the additional benefits for which the law provides A sickness fund desiring so to extend insurance must adopt a rule to that effect which may provide for the granting of family benefits generally or only to those members who especially apply Where sickness funds provide family benefits, they either pay the doctor an inclusive fee for his attendance on family and dependents, if any, or separate fees for members and families The former method of payment appears to be the more common, and the effect of this arrangement is that the accounts of sickness funds seldom afford any indication as to the actual cost to members of attendance on dependents The medical benefits to dependents are limited in some instances to ordinary attendance, in others, drugs are given in addition, and some even give appliances The benefits are given, however, for thirteen weeks only instead of twenty-six applicable to members Sometimes hospital treatment is given or a contribution is made toward its cost.

Family insurance seems to be common in Leipzig, Stuttgart and Dresden but rare in Berlin Of twenty local sickness funds for large towns, twelve give and eight do not give family benefits Of twenty-three important factory funds, each having over 1,000 members, eleven give and twelve do not give this benefit. The foregoing twenty local sickness funds had, in 1911, an aggregate membership of 1,218 048, those with family benefit having 740,000 members, or 60.8 per cent., of the whole, and those without family benefit having 337,000 members, or 22.9 per cent., of the whole The factory funds had an aggregate membership of 140,223, those with family benefit having 86 636 or 61.8 per cent of the whole, and those without family benefit having 53,517, or 38.2 per cent., of the whole Combining the two groups of funds, 60.9 per cent. of their members received family benefit and 39 1 per cent. did not. This is too small a number from which to draw any general conclusions as to the extent to which family benefits are given throughout Germany, but are given as types

The amount of medical attendance necessary where family insurance is provided is probably determined more by the definition of the term "dependents" than by the duration of medical benefits Every sickness fund defines this term for itself For instance, in Bremen the following dependents are given the foregoing insurance wife or husband and children, including adopted children, in Dresden, wife or husband, and children and stepchildren under 15 years, in Leipzig, wife or husband, parents, grandparents, parents-in-law and children under 16 years, in Stuttgart, wife and children under 14 years, in Remscheid, wife or husband or relative in charge of household, children and foster children, parents and parents-in-law, and in the case of unmarried members having their own households, the mother or sister in charge, in Essen (Krupp), wife, children and other relatives of member by blood or marriage resident with him and wholly or mainly dependent on his earnings, but not a housekeeper or a servant.

An estimate of the cost of medical attendance per head on members and dependents together can be made, but no accurate data are available to separate the difference between the dependents and the members where such additional benefits are given The data[7] available, however, seem to justify the assumption that one third of the members of the large federations of sickness funds, formed for miscellaneous trades and occupations, are married, and that three dependents per household is not an excessive average On this basis of computation where a sickness fund provides family insurance, any given number of members would double that number entitled to medical attendance Applying this numerical test it is possible to form an approximate idea of the cost of attendance per person entitled to it In 1911 the federation of local sickness funds at Leipzig, Dresden and Stuttgart, with an aggregate membership of 412,000, paid $1 82 per member for general treatment by general practitioners and specialists, exclusive of dental treatment. Counting one dependent extra for every member, this would be equal to about 91 cents per individual entitled to attendance On the other hand, eight other important sickness funds dealt with in this report paid separate fees for attendance on dependants, the mean rate being $2 06 per family exclusive of the insured head Assuming an average of three dependents per family, the cost per individual would be 68 cents

There is considerable variation in the cost of medical attendance in Germany between sickness funds of the same type and also those of different localities In Berlin, where attendance to members only is provided, the cost of attendance by general practitioners and specialists, dental treatment being excluded, ranges from 91 cents to $1 15 a head, and the mean rate expenditure on this point of six important funds is $1 08 per head In other parts of the country the cost of similar attendance for members only ranges from $1 095 in the case of the Frankfort-on-the-Main Federation of Sickness Funds to $1 43 in the case of the Munich federation and $1 44 in the case of that at Düsseldorf Similarly, the cost of ordinary medical attendance where dependents are treated ranges from $1 40 per member in Dresden, where the system of district doctors with fixed salaries prevails, to $2 065 per member in Leipzig where the doctors are engaged on the organized free choice principle.

The data available indicate that the extension of medical treatment to dependents greatly swells the drug bill. In Leipzig of a total payment for drugs and dressings 39.5 per cent was incurred on behalf of dependents, in Stuttgart, 43 per cent. on account of dependents

REMUNERATION OF PHYSICIANS

In considering the methods of remuneration of physicians which had been adopted under the German sickness insurance law it has to be remembered that the practitioner does not dispense his own prescription but refers his patients to the pharmacist of his choice Another thing to remember is the existence of official scales of medical, surgical and dental fees for use in the absence of agreements for fixing a minimum and maximum charge, as a rule within a very large range The government of each state has the right to use an independent scale of charges, and while the larger states—as Prussia, Bavaria, Wurttemberg, Saxony and Baden—have their own scales, many of the smaller states adopt the scale of Prussia In some towns the doctors, when organized, agree to the modification of the official scale, but they cannot increase the minimum fees The law requires that these minimum fees must be charged to workmen's sickness insurance funds, poor law administrations and poor persons

---

[7] National Health Insurance Cd 6 81

Each sickness fund has an entirely free hand in the method of remunerating the physicians The law does not set the amount of payment, although in the absence of formal agreement with the physicians it follows that payment will be by attendance according to the minimum fees of the official scale The adoption of this scale as the basis for payment or for the division of the medical remuneration fund is one of the demands on which the medical profession, as organized on the Leipzig basis, is most insistent In few towns is the *system of medical remuneration uniform* Owing to the multiplicity and diversity of the sickness insurance societies, each independent and free to make its own arrangements with the physicians, various systems exist side by side Whatever the method on which the physicians are paid, no restriction is made on private practice, and if physicians devote their whole time to attending members of the sickness funds, and this is often the case, it is done voluntarily

The various methods of remuneration are as follows Payment by attendance, under this system the fees charged are as a rule the minima of the official scale, though in some cases a reduction is made on these minima in the case of often recurring services, or, again, an agreed reduction varying from 10 to 20 per cent may be allowed on all official minimum fees alike Here the position of insured persons is exactly like that of private patients The only large federation of sickness societies known to pay its medical staff unconditionally on this principle, though there may be others, is that of Bremen with a membership of about 30,000 On the other hand, the unattached factory and trade guild funds of the town very commonly pay the physicians on this principle In the rural districts the plan of payment by attendance is common and often found to be a condition of efficient medical service or any service at all In Stuttgart the factory and guild funds, as a rule, pay for all attendances at the minimum rates less a deduction of 20 per cent and this is the case with many of these funds in Munich In Leipzig the reduction is usually 5 or 10 per cent

The sickness fund federation in Bremen serves for all trades and occupations and includes also most municipal work people Voluntary arrangements are made for the treatment of dependents, 3,000 members paid special contributions for family treatment in 1911 All services of general practitioners are paid for separately, according to the schedule of fees embodied in the agreement with them Specialists are not paid by agreement The average inclusive cost of medical attendance for members only, in 1911, was $1 522, made up of $1 004 for general practitioners, 31 4 cents for specialists and 20 4 cents for dentists, etc The cost of medicines and appliances for members only was 97 6 cents a head, and hospital treatment cost $1 474 a head Although there are striking exceptions, it is found that sickness funds which pay the physicians by attendance without the common device of a pooled capitation payment, limiting their liability in advance, have to spend more on medical treatment than those which stipulate for this protection Where in Munich sickness funds pay for medical attendance according to the minimum rates of the official scale, the cost per member usually ranges from $2 to $2 50 per annum, where the system of remuneration is a pooled capitation payment plus fees for special services, the cost usually ranges from $1 43 to $1 87 per member, and where the capitation fee includes all services, the usual cost is $1 50 per member

In other towns it was possible to compare the experience of funds which under pressure had changed the method of a pooled capitation payment for that of payment according to attendance without limit In the case of a large factory fund the effect was an increase in the cost of medical treatment from $2 33 per member, including attendance on dependents, on the average of the years 1906-1908 to $3 95 on the average of 1909-1911 The cost of medicine and appliances also increased from an average of $1 31 to $1 44 per member, while the cost of hospital treatment remained unchanged Conversely, a fund which sometime ago commuted its payment for special services into a fixed annual sum finds that by so doing it has prevented an increase of 40 per cent in that item

CAPITATION FEES TO THE INDIVIDUAL PHYSICIAN

Under this system each physician engaged receives a fixed fee per head per year in respect of all insured persons whom he undertakes to attend, with or without certain special services according to the terms of the agreement If there be a choice of physician, it is made at the beginning of each year This is the method of remuneration adopted by the miners' societies in Prussia and by some of the railroad employees It also occurs in many factory funds The specialists were paid $1 62 or $2 50 for the treatment during six months, if necessary, of each case referred to *them by* a general practitioner, the lower fee being paid to oculists and the higher to the specialists for ear, nose, throat and genito-urinary diseases Surgeon dentists are paid $1.25 per case, this fee covering six months' treatment if necessary Each general practitioner is appointed to a district, and capitation fees are paid to him for all the insured miners in the district

In Cologne the State Railroad Board pays the physicians on the same system The physicians are appointed for fixed districts In the towns of the district the insured persons have free choice, in the rural districts they call in the nearest physician The general practitioners are paid as a rule $1 each for single members, with modifications according to local circumstances, for married members $1 75, with additional fees of $3 50 for confinements, night visits $1 99, night consultations 50 cents, and for assistance to other physicians and attendance on members of other sickness funds A physician also receives a free ticket entitling him to travel second class by all trains within his district Specialists are paid the minimum fees of the Prussian official scale

Capitation *payments into a pooled fund, with or without extra* fees, for prescribed reserved services is another system The pooled fund is divided among the physicians according to the services performed, and the extra fees are paid to the physicians who have earned them In some cases special fees are deducted from the pool before it is divided The physicians usually are paid quarterly, the capitation fees being based on the monthly average membership figure reckoned for each quarter separately This method is the most frequently adopted From the point of view of the sickness funds it has the advantage that liabilities can be estimated in advance within narrow limits from year to year and their budget arranged From the standpoint of the physicians, remuneration is proportionate to services performed The extra services most commonly paid for are obstetric services, night and urgent visits, attendance on members of other sickness insurance funds, and sometimes mileage allowances are added to these extra services Where a sickness fund pays for operations outside the pool, it is usually stipulated that extra charges *shall be paid only for services* carrying minimum fees in excess of 75 cents or $1, according to the official scale

The Munich Federation of Sickness Funds with a membership in 1911 of 136,477, which does not provide family benefits, pays a capitation fee of $1 06 and in addition pays for all operations carrying fees from 75 cents upward, according to the official minimum rates These special fees are laid down in an exhaustive schedule and are in some cases *below the* official minimum The total cost in 1911 of all medical attendance, including dental treatment, massage, etc, was $1 658 per member The Stuttgart Federation of Sickness Funds, with an average membership in 1911 of 89,777, which provides attendance to all dependents, pays capitation fees of $1 072 and $1 25 for single members and $2 68 *to* $3 75 for married members, these fees being pooled, and extra fees to the physicians earning them for operations and certain special services But all operations carrying a fee in excess of $3 75 are performed in the municipal hospitals The total cost of medical attendance cannot be separated as between members and dependents, but togther it averaged, in 1911, $2 41 per member

The Essen Federation of Local Sickness Funds, with an average membership of 27,158 in 1911, though paying nominally under a pooled capitation fee arrangement, guarantees to the physicians remuneration equal to 90 per cent of the value of their individual services based on the rate of 25 cents for a consultation and 37 cents for a visit The pooled capitation payment is now 87 cents in respect of general practitioners and 7.2 cents in respect of specialists, or together 94.2 cents with $1 87 extra where attendance is given to dependents, family insurance being voluntary The total cost of medical treatment, including 1,300 families, was $1.29 a head, the cost of medicine and appliances 85 cents, and the cost of hospital and other institutional treatment $2 22

In Düsseldorf the capitation payment is based every year on the average value of the services performed during the three preceding years when charged according to an agreed scale of fees On this sliding scale of payment, the capitation payment ranges from $1 50 to $1 62 without family attendance

PAYMENT PER CASE OF SICKNESS ATTENDED

This is an uncommon method of remuneration, adopted under special conditions which make the other methods inapplicable, though pooled funds are often divided on this principle. The Frankfort Federated Sickness Funds use this method in treating their members in the rural districts The fee in this case is $1.25 per case of sickness subject to the conditions that for this fee a patient must be attended for twenty-six weeks if necessary, and that three cases of sickness at the most may be charged for in one year in respect of the same member Specialists also are paid by this method, for example, the specialists who attend the members of the General Miners' Sickness Fund at Bochum in Westphalia The Bochum Sickness Fund formerly paid specialists $2.50 per case attended, but at present pays by a pooled capitation system of 7.2 cents per member, being the ratio per member set aside by the fund for this payment

Payment by fixed salaries is an unusual method of payment, although adopted by some sickness funds and by some of the miners' funds The Dresden Federation of Sickness Funds is the best known example of this, which had an average membership in 1911 of 127,938 and which gives medical attendance, without medicine or appliances, and partial hospital treatment to dependents The area served by the Dresden fund is divided into 160 districts of unequal extent, and a physician is assigned to each district The insured persons in a given district are expected to consult the physician in that district. In case of dissatisfaction, their wishes are considered as far as possible. All appointed physicians, as a matter of fact, engage in private practice. Salaries range from $1,250 a year to $150 The only extra payments are fees for night visits in special cases of 75 cents and mileage in the case of rural physicians, and also all dressings and drugs needed by the physicians as distinguished from those prescribed

In the beginning of 1912 there were 109 town physicians engaged by this federation fifty-four country doctors, sixty-five specialists, with two whole-time confidential or certifying physicians The salary of town physicians in 1911 averaged $939, the country physicians $377 75, and the specialists $754.25 The total cost of medical attendance, including attendance on dependents, averaged $1 592 per member, the cost of medicine and appliances as supplied to members only $1 106, and the cost of hospital and institutional treatment, only partially given to dependents, $1.322 Some towns vary the Dresden system by guaranteeing the physicians appointed a minimum salary with an addition depending on the number of their services

The plan of employing whole time physicians at fixed salaries has been adopted at different times and places, but only experimentally At Remscheid, in Prussia, it was tried from 1898 to October, 1905 Six physicians were appointed to attend about 10 000 members and their families, but the number was later increased to eight. These physicians were paid fixed salaries of $1 500 increasing to $1 750, except an eye and ear specialist, who received $1,750 increasing to $2 000 Each physician had an assigned district but in case of excessive work a physician could assign to a colleague During the time this method of appointing and remunerating physicians was in force the cost of medical attendance, including attendance on dependents as stated ranged from $1 436 to $1 814 per member During 1905 the system of limited free choice of physicians was introduced with payment out of a pooled fund according to the number of cases attended In Table 4 is given the cost of attendance for members and dependents from 1896

In medical benefit associations in several towns—Berlin, Munich and Cologne, for instance—groups of sickness funds have established associations for the provision of medical attendance, with or without medicine and appliances, independently of the other benefits secured to insured persons by statute, leaving these other benefits to be administered by the affiliated funds in the usual way An old established association of this kind in Berlin, comprising forty-eight sickness funds with an aggregate of 191,000 members, administers all the statutory medical benefits on behalf of the affiliated funds, but while it concludes agreements with and pays the physicians, the cost of medicine and hospital treatment is paid direct by the funds concerned Attendance on dependents is not provided The city and suburbs are divided into medical districts, and at least one physician is appointed for each at a fixed salary In 1912 the number of physicians was 200, of whom 160 were general practitioners and 40 specialists All members are free to consult any physician on the list, but if visits are desired, a physician of the neighborhood must be called in The affiliated sickness funds paid to the association for medical attendance 93 cents for each member, and the physicians received on an average a salary of $750 The physicians were free to attend members of other sickness funds

A somewhat similar association in Munich undertakes to provide medical attendance for twenty-six weeks, exclusive of medicine and hospital treatment, on behalf of a number of factory and other sickness funds It deals with a membership of 26,000, with about 44,000 dependents, $1 31 a head is paid for individual members, and $2 75 for dependents, wife and children, with no extra payments for operations The physicians are paid by a pooled capitation system according to the services they perform Office visits are reckoned as worth 18 cents, house visits at 50 cents, and operations according to the Munich schedule of medical fees In the early days of compulsory insurance in Germany, some of the largest funds were able to obtain medical attendance at a cost of 25 cents a head In 1891, when the Berlin free choice association of physicians was formed, the average cost was 39 cents per member The largest of the Berlin sickness funds, that for commercial employees, working under a system of district physicians, did not for several years pay more than 25 cents per head for medical service, in 1894 it was paying 75 cents, from 1902 to 1909 the pooled capitation fee was 81 cents with fees for a few special services although in the meantime the duration of treatment had been doubled, and in 1912 the capitation fee was $1, and, exclusive of dental treatment and massage, in 1911 the total cost of medical treatment was $1 074 per member

TABLE 4 —COST OF ATTENDANCE FOR MEMBERS AND DEPENDENTS

Year	Amount	Method
1896	$1 048	Limited number of physicians paid by pooled capitation fee, plus extra fees
1897	1 422	
1898	1 44	
1899	$1 52	Whole-time physicians, paid fixed salaries
1900	1 546	
1901	1 446	
1902	1 476	
1903	1 388	
1904	1 658	
1905	1 814	
1906	$1 93	Free choice among all organized physicians and payment by case from pooled fund with special fees
1907	1 956	
1908	1 926	
1909	1 968	
1910	1 966	
1911	2 02	

SCOPE OF TREATMENT

This increase in the cost of medical treatment has been due only to a certain extent to the higher fees paid to physicians The main increase has evidently been due to the broader scope of treatment due to the progress of therapeutics, to the extension of treatment by specialists, and to the increased recognition by the working classes of the importance of health and their willingness to make large sacrifices to obtain it

The sickness funds are usually disposed to give a very liberal interpretation to medical treatment The treatment by specialists under most funds depends on the recommendation by the general practitioner first consulted, but in some towns, such as Munich, members are allowed to go directly to any specialist on the medical list without previous recommendation Specialists with whom the large sickness funds conclude agreement are those for eye, ear, nerve, skin, throat, stomach and women's diseases Medical treatment often comprises Roentgen-ray applications, electric treatment, mechanical exercises, such as the Zander institutes, and the like In 1912 the central committee of the sickness funds of Berlin completed the equipment of an establishment for general use, including Roentgen-ray, hydrotherapeutic, electric and physical treatment on a large scale, and in the course of the first fifteen months, 6,800 persons were treated Some of the large federations of sickness funds, like those of Leipzig and Dresden, have well equipped rooms attached to their central offices in which mechanical treatment is given in the most approved methods The large sickness funds in the towns also provide their sick members with medical baths of great variety

The accident funds also are insisting more and more that they shall take charge in the early weeks of many of the fractures and other injuries in order that they may obtain, by proper surgical care and exercises, better results and less total permanent or partial disability The treatment of teeth is usually regarded as falling within the scope of medical benefit, but artificial teeth are seldom provided, though some funds make a contribution toward their cost Some large federations of local sickness funds, like those of Stuttgart and Düsseldorf, have their own dental clinics, equipped and worked at great expense

The drugs which may be prescribed by authorized doctors include not only all the drugs scheduled in an imperial rescript as being reserved for sale by qualified pharmacists, but also medicaments in general The rules of some sickness societies prohibit the use of drugs, the therapeutic value of which has not been sufficiently proved, and of certain expensive drugs There are certain rules, and definite care is required of the physicians that they shall prescribe economically, and the medical controlling committees criticize closely the economy or lavishness with which the ingredients of prescriptions are chosen In Frankfort all physicians about to enter the funds must spend six months in attending the meetings of the committee, during the sessions of which discussion of prescriptions takes place The appliances usually given include trusses, spectacles and similar appliances There may, however, be provided larger appliances in the way of additional benefit When this is done, a limit, of course, is usually fixed The Berlin local sickness fund for commercial employees, in addition to minor appliances, supplies artificial limbs, appliances for flat feet, corsets and other supports to a maximum cost of $12 50 for any one person The sickness fund of the General Electric Company of Berlin supplies artificial limbs to the amount of $12 50 for any one person The Leipzig federation of sickness funds provides artificial limbs and teeth and other larger appliances to a value of $18 75 for any one person Some funds leave a provision for larger appliances to the discretion of the executive The law of 1911 uses the term "other minor appliances" instead of "similar appliances" It empowers sickness funds to supply appliances to cripples to enable them to obtain employment, to fix a limit of value up to which minor appliances are provided, and to contribute up to that amount toward the cost of more expensive appliances

HOSPITAL AND INSTITUTIONAL TREATMENT

Although hospital treatment as an alternative to home treatment now ranks as a minimum benefit, the law reserves to sickness funds an unconditional right to decide as to whether the alternative shall be offered or not Hospital treatment, however, is very widely given, and the expenditure under this head forms an important part under the cost of medical benefits The provision of hospitals is, in Germany, a duty of the local government authorities, and the public hospitals are used for the great majority of patients so treated In the larger towns a certain proportion are treated in institutions managed by ecclesiastical bodies, and in state, university and private clinics Such treatment is usually made dependent on the prior consent of the executive of the fund except in urgent cases Hospital maintenance is paid for by fees which usually vary from 50 to 75 cents per day both in public and in private institutions Sometimes sickness fund patients are treated in public hospitals at bare cost or even under cost There is no extra charge for operations in public hospitals, but in private clinics these are generally paid for extra

Pension boards which administer the invalidity insurance law supervise the sanatorium treatment under the German insurance system As a rule a sickness fund and the pension board for the district agree to bear a portion of the cost of their institutional treatment The cost of curative treatment of all kinds given by the pension boards of Germany in 1910 amounted to over $6,000,000, and after the deduction of all refunds, the cost to the pension boards themselves was $5,250,000

The large sickness funds themselves do a similar curative work, and this is one of increasing importance Thus the Leipzig Federation of Sickness Funds has the use of five sanatoriums and convalescent institutions, to which 3,038 patients were sent in 1911, while 2,602 of its members were sent to baths and health resorts The Düsseldorf fund has a convalescent home, and other large funds are in the same position

MEDICAL BENEFITS IN NORWAY

In Norway the local insurance societies are required to render the following aid to a member himself free medical attendance and the first supply of such accessories as eye glasses, trusses, etc., and when surgical treatment is required, bandages and the medicaments required for such treatment according to the surgeon's order In cases of sickness coming under the accident insurance law, free medicine, in cases of invalidity, pecuniary aid equal to 60 per cent of the average daily wages of one of the four income classes defined in the law, but the pecuniary aid, together with any payment the person concerned receives for work during his sickness, or with any pecuniary aid he may receive from private sickness insurance, shall not amount to more than 90 per cent. of his actual income at the beginning of his sickness For persons who work for no wages and voluntarily insured persons who have no income, the total pecuniary aid shall not amount to more than 16 cents per day In the case of confinement, pecuniary aid for six weeks and, if necessary, physician's attendance These grants are made on condition that the woman has been a member of a public or recognized private or communal sickness society for at least ten consecutive months immediately preceding If sickness results, the usual sickness aid shall be given in place of the confinement aid Burial aid equal to twenty-five times the average daily wages in the income class concerned, but not more than 50 crowns, or $13 40 To the wife or husband of the member for whom he or she provides, and to children under 15 years living at home, free medical attendance only

In place of the benefits just mentioned, hospital or asylum care may be given by the advice of the physician In the case of an industrial accident, the Royal Institution of Insurance may, in accordance with the industrial insurance law, require that this be done During a person's care in a hospital, no pecuniary aid is given to him If he has relatives dependent on him, they are given pecuniary aid equal to 20 per cent of the average daily wages if there is only one dependent, 35 per cent if there are two, and 50 per cent if there are three or more

Money benefit is paid for six days in the week while the person is incapacitated for work, but not for the first three days of sickness and not to exceed twenty-six weeks in any one case of sickness A recurrence of the same sickness in the year is regarded as a continuation of the first case, and pecuniary aid shall not be given for more than twenty six weeks altogether If a member has received pecuniary aid for for twenty-six weeks, he shall not receive pecuniary aid for more than thirteen weeks for new attacks of the same sickness during the following year, but if no such attack occurs during this year, a subsequent attack is regarded as a new case and treated accordingly If, for the same case of sickness, a member has received aid for the thirty-nine weeks altogether, he shall receive no more aid for this sickness until two years have expired and he has been during this time free from the sickness in question Every day in the hospital is counted as one day of pecuniary aid

In the case of sickness due to industrial accident, the local sickness society is not required to give assistance for more than four weeks, but the national society, that is the Royal Institution of Insurance, may require that aid be continued beyond this time with the assurance of reimbursement by the royal institution from the funds of accident insurance In case of an injured person who did not have sickness insurance at the time of the accident and is not assured of full wages for three months, the Royal Institution of Insurance may require that the local society shall care for such person on the conditions mentioned above. If a workman, while temporarily employed in a foreign country, is entitled to aid under this law, his employer is under obligation to render this aid himself and he shall be reimbursed by the local society If a servant is receiving care in sickness in the home of his master, the latter receives the pecuniary aid due the servant under the law The master must give such servant care for six weeks unless the sick person can, with the approval of a physician, be put into a hospital

BENEFITS IN ENGLAND

Under the present English law the benefits conferred on insured persons are of two kinds the minimum benefits to which, with certain qualifications, every insured person is entitled, and the additional benefits to which an insured person may be entitled if he is a member of an approved society which shows a surplus on valuation In each case a contribution of two ninths in the case of a man and one fourth in the case of a woman will be made by Parliament toward the cost of benefits The minimum benefits are, first, medical benefits, that is, the right throughout life to free medical attendance by any physician who applies to the insurance committee for the county or county borough in which the insured person resides for a place on their list, and who consents to accept him as a patient If the physician of his choice refuses him, he will be assigned by the committee to one or other of the physicians on the list. Medical benefit includes free medicines and drugs, and such appliances as the insurance commissioners may allow It does not include any right to attendance in respect of a confinement. As one of the additional benefits, the right to medical treatment may be extended to the dependents of an insured person Second, sanatorium benefit, which is the right throughout life to treatment in a sanatorium or otherwise for an insured person suffering from pulmonary tuberculosis or any other disease which the local government board may appoint. The insurance committee which administers this benefit may also pay or advance the traveling expenses of an insured person to and from the sanatorium This benefit may be extended to his dependents if the sums available for it allow, independently of any surplus in the member's own society Third, sickness benefit a payment of $2.50 a week for a man and $1 87 for a woman beginning on the fourth day of illness and continuing for twenty-six weeks, notice of the illness must be given before the claim can be allowed An insured person will not be entitled to this benefit until twenty-six weekly contributions have been paid in respect of him, and it is this benefit which, in the case of a member of an approved society will be reduced if he is in arrear Fourth, disablement benefit, which is a continuation of sickness benefit at the rate of $1.25 a week for a man or woman, lasting as long as the illness The right to this benefit does not accrue until 104 weekly contributions have been paid in respect of the insured person but both sickness and disablement benefit will become payable as soon as the necessary period has elapsed and the necessary contributions have been paid although the illness began before that time. The right to both of these benefits ceases at the age of 70 The test for both of them is that the claimant must be rendered incapable of work, that is, of any work whatever, by some specific disease or by bodily or mental disablement, but any disease or disablement in respect of which he is entitled to compensation or damages from his employer or any other person under the workmen's compensation act of 1906 or the employer's liability act of 1880 or at common law is excluded In that case, however, his society or insurance committee may assist him to enforce his rights Any approved society may substitute for sickness or disablement benefit or part of them any of the additional benefits and may give its members an option in the matter Fifth, maternity benefit, which is a payment of $7.50 in the case of confinement of the wife, or where the child is a posthumous child, the widow of an insured person, or of any other woman who is herself an insured person Where a married woman, or in the case of a posthumous child, a widow, is herself an insured person, she will be entitled to sickness or disablement benefit as the case may be during her confinement, in addition to her maternity benefit, but any other woman, that is, any unmarried woman, will not be entitled to those benefits for four weeks after her confinement unless suffering from some illness not connected with it The right to maternity benefit will not accrue until twenty-six, or in the case of a voluntary contributor fifty-two, weekly contributions have been paid The benefit will be administered in cash or otherwise at the discretion of the society or insurance committee concerned, but in every case the mother will have the right to choose a physician or midwife to attend her whose fee must be paid out of the $7.50 benefit.

Sickness, disablement and maternity benefits will not be paid to a person in a hospital, infirmary or sanatorium, but may be applied for the maintenance of his dependents, if any, or if he has none, may be paid for the upkeep of the hospital or infirmary, or, in the case of a sanatorium, to the insurance committee Where a married woman who is herself insured and entitled both to maternity and sickness or disablement benefits goes into a hospital or infirmary for her confinement the maternity benefit will be paid to the hospital or infirmary, but the sickness or disablement benefit will be applied for the maintenance of her dependents, if any

Besides minimum benefits, there are additional benefits which an approved society can give to its insured members if at the end of each three years it is found to have a surplus available. These include an increase of the minimum cash benefits, allowances for partial disablement and during convalescence, pensions, distress payments, and remission of contributions, but not death benefits It can give him, in fact all benefits that the money will pay for, that is to say, all benefits which can be given to a man joining at 16 and paying a contribution of 14 cents a week, the amount depending on the management of the society and the health of the members

Finally, there is a prospect of extended benefits at the close of a period of eighteen years To the worker who joins as a young man and who does not expect in the course of nature to draw heavy sick pay before reaching the age of 40 or 45 this prospect of extended benefits is of real value The fact is that for a period of eighteen years a part of the contributions goes to a fund for equalizing the benefits of old and young, at the end of that time, when the process of equalization is complete and the fund provided, the whole of the contribution of 14 cents a week and the whole of the state grant of 4 cents will be available for the purpose of paying benefits unless some further small accumulation is made and the benefit so extended will be paid to insured persons when the period is complete. It is important to remember that all these benefits are guaranteed within limits, to members of approved societies only The deposit contributor will get only benefits to the extent of his balance at the postoffice, plus the state grant, and is therefore not really insured The position of deposit contributors must be reviewed by Parliament before Jan 1 1915 Whether, owing to the war, this was done or not, it is impossible to say

There are however, six classes of insured persons, in addition to those already mentioned who will not receive all the benefits in full First are persons under the age of 21 not married and having no members of their families dependent on them, second employed contributors who become insured within one year after the commencement of the act and are then over the age of 50, third, employed contributors who enter when above the age of 17 after one year from the commencement of the act fourth employed contributors whose employers with or without their consent exercise the option of undertaking the liability to pay full wages during about six weeks of sickness During the six weeks when full remuneration is received from the employer, no sick or disablement pay will be due to the insured person but it will begin when the liability of the employer ceases Fifth, those of men over 65 and under 70 at the commencement of the act, sixth those of aliens

All these six classes have certain qualifications and certain conditions under which they are partially insured, the details of which are unessential for the purpose here and must be obtained from the act itself

Working of the British National Insurance Act

There is a great advantage in studying the workings of the English sickness insurance law We are able to study a law which is in the process of reaching its equilibrium To obtain this equilibrium there has been an intense and bitter fight of the medical profession for its rights, for the government was endeavoring to bring the insurance act into operation without consultation with the profession whose duty it was to administer it To appreciate what it means to administer such a huge machine as this government insurance scheme is, a statement of the Committee on Inquiry instituted by the Fabian Research Department in July, 1913, is very instructive

"The immense organization required for issuing the benefits to these 13,700,000 of insured persons, of whom nearly 11,000,000 are in England, appears—so far as the actual payment of the money by the approved societies is concerned—to be working on the whole with a fair degree of efficiency We gather that in the aggregate something like 80,000 new claims per week are made in the United Kingdom for sickness benefit and 18,000 for maternity benefit on the 23,500 approved societies and autonomous courts, lodges or branches, and that the total number of claims paid, new or old, for both benefits amounts each week to between $1,250,000 and $1,500,000, representing a total payment that often exceeds $750,000 in a single week The 23,500 societies, lodges and courts evidently differ greatly in the rapidity with which they deal with their claims, the stringency of the examination to which these are subjected, and the promptitude with which the decision is carried out But regarding England as a whole, with respect at any rate to four fifths of the cases, the large sum involved is being got into the hands of the sick persons, and in the case of maternity benefit now into the hands of the mothers themselves, with commendable regularity and promptitude The doctors, after some initial objections, are now giving their certificates without charge in terms enabling the great majority of the claims to be at once admitted"

The last sentence is equivalent to saying that the individual animosity and antagonism to the insurance act among the physicians has practically subsided To understand the antagonism with which the insurance act was received in England by the physicians, one must understand the situation that existed previous to the passage of the act and also some of the contentions that arose before the act went into effect

CONDITIONS BEFORE THE ACT

About ten years ago it became very evident in England that the circumstances under which the general practice of medicine could take place were rapidly becoming less and less advantageous to the profession[8] The result of preventive medicine and public hygiene had brought about such a diminution of the infectious diseases that there was a very noticeable diminution in the income and in the medical practice from these sources, especially since in a vast majority of these cases, when they occurred, the patients were sent to isolation hospitals to be cared for and were not kept in the hands of the practitioners It is said that where many practitioners among the poor had ordinarily received $700 or $800 a year from this source alone, they now hardly receive $50 a year It is also said that twenty years ago the obstetric practice of a general practitioner was an important part of his income, and that at that time it was thought that 70 per cent of the confinements were attended by physicians At present, especially in the large towns, 80 per cent of the confinements are attended by midwives, and even when physicians are called in, the fees are much lower than they formerly were Not only had it become noticeable that practice among the poor meant very small fees with many bad debts, but also it was well recognized that the poor could not pay for their medical services without crippling themselves for many months to come after any illness of more than ordinary length This had caused various forms of clubs, associations and medical benefit societies to spring up, and what had been undertaken in many instances as part charity had become settled as a method of taking care of the poor, the medical fees for which were notoriously inadequate for the services rendered Lodge practice and club practice were so prevalent that the British Medical Association undertook to investigate the situation, and made a report in 1905 It is evident from this report that the usual method of payment was by capitation with all its usual evils, inadequate payment for excessive work, and the resulting poor medical return to the patient This, in return, placed the club physician on a contemptible footing, and if anything serious was the matter, in which an ordinary fee would be paid, the patients invariably sent for what they called a "proper doctor" There was no possible security of tenure of the position as physician to these lodges, and physicians were under lay control and were liable for the most trivial causes to be dismissed As the complainants were also the judges, physicians were dismissed for what patients considered to be harshness when the physician was often conscientiously endeavoring to prevent malingering The remuneration in the lodge practice was difficult to obtain, but in 269 clubs providing attendance for males only, records were kept, and Table 5 shows the results[8]

The average fee obtained, according to this table, per visit is almost exactly 21 cents, and each club member on the average had been attended four times during the year This table does not take in the attendance for giving of certificates for unfitness to work, as the physicians did not keep record of these visits because they did not charge for them, but making out certificates, as is well known, is time consuming It was further stated that most club physicians did not keep record of attendance on club patients when no medicine was given, so these statistics are understatements rather than overstatements of the situation Moreover, when the club or lodge only cared for the head of the family, the lodge physician had no guarantee, if he cared for the insured, that he would be called in to care for the rest of the family, because, as stated above, the lodge physician was looked down on even by the patients as being an inferior sort of doctor

TABLE 5 —REMUNERATION IN LODGE PRACTICE BEFORE THE NATIONAL INSURANCE ACT, 1911

Annual Capitation Fee	Members	Average Capitation Fee	Average Attendances per Member per Year	Average Fee per Attendance
$0 50 to $0 75	9,630	$0 59	$3 59	$0.159
75 to 1 00	9,311	81	3 67	.211
1 00 to 1 25	17,741	1 02	4 46	2196
1 25 and upwards	4,211	1 35	5 43	.2672

The reasons given for the hold the lodge practice had on the profession were the usual ones that the lodge work forms only part of the practice and can be done in the midst of the daily routine of visits, or that it is undertaken by beginners to gain a foothold and a living until they can obtain a better practice, and among the older practitioners it is done because, if they are willing to do it, there will be less likelihood of other physicians settling in that district and competing in other practice—all of these reasons being the practical, everyday economic questions of existence One of the practical results of the investigation of lodge practice was that the contract practice committee of the British Medical Association had obtained the approval of the Representative Meeting, equivalent to the House of Delegates of the American Medical Association, to a scheme to establish what was called a Public Medical Service organized by the profession, and in a few towns, such as Norwich, a medical association on the Association lines was actually established by the medical profession and several such services successfully competed with the friendly society clubs The lodge practice report of the British Medical Association contains a majority and a minority report In the majority report the association recommended the extension of the contract system of the clubs, and while this was preferred rather than the minority report, the British Medical Association preferred the scheme as spoken of above which it itself had started, and had it not been for the appearance of the insurance law, this undoubtedly would have been put into effect The minority report recommended that a unified medical service should be established under the control of the county and county borough public health authorities It was felt that the minority proposal for a system of whole-time medical officers could not be confined to the poorer classes and that a free medical service open to all would result The profession in general was opposed to this system because of the opposition which had arisen between the health officers and the general practitioners, and they feared that domiciliary medical attendance would arise under the control of the boards of health which the profession had universally so far opposed

---

[8] Carr, Garnett and Taylor National Insurance

CONTROVERSY BETWEEN THE BRITISH MEDICAL ASSOCIATION AND THE GOVERNMENT

It was during the discussion of the majority and minority report that the principle of free choice of physician became prominent, and it was felt that any salaried public service would prevent this freedom of choice When the insurance act was proposed, the British Medical Association presented six cardinal points which it considered as essential to be incorporated into the act. First, an income limit of $10 a week to those entitled to medical benefits, second, free choice of physician by the patient subject to consent of physician to act, third, medical benefit to be administered by insurance committees and not by friendly societies, fourth, method of remuneration of medical practitioners adopted by each insurance committee to be according to the preference of the majority of the medical profession in the district of that committee, fifth, medical remuneration to be what the profession considered adequate with due regard to the duties to be performed, sixth, adequate medical representation among the insurance commissioners on the central advisory committee and on the local insurance committees and statutory recognition of a local medical committee representative of the profession in the district of each insurance committee. Moreover, it was agreed by the majority of the profession, in the signed agreement with the British Medical Association, that they would undertake no medical service unless under such agreement as this

Without going into all the details of the dispute, four of these six demands of the medical profession were granted by the government and incorporated into the act. The first one that the act be limited to patients having a maximum of $10 a week income was not granted, it was finally decided to include up to $15 a week. In the beginning the government contemplated allowing a capitation fee of $1 12 but after a final refusal by the physicians to act and within a very few days before the act was to go into effect the government compromised and allowed a straight capitation fee of $1 62, and this further sum could be increased by 12 cents per capita to any panel physician for treating tuberculous patients A minimum capitation of 8s 6d., or $2 12, was claimed, not including extras, medicines for members of approved societies, and the recognition of payment per attendance was also claimed in which case the fees would be on the basis which should be deemed an equivalent to the foregoing by the State Sickness Insurance Committee with the recognition of a $10 maximum in a week income limit.

There was also an ingenious scheme put into effect to tempt the physician to be economical in prescribing drugs The amount allowed for each patient was 37 cents per patient for drugs and appliances There was set apart 12 cents for each patient which was called "the floating sixpense.' If, by economical prescribing the 37 cents was adequate for the drug bill then the full 12 cents went to the physicians If the latter by extravagant prescribing raised the drug bill higher than 37 cents per patient then the excess was taken out of this floating sixpense fund' and paid to the pharmacist, the remainder going to the physicians The straight capitation fee, therefore became $1.74 if a man took care of tuberculous patients and a possibility of $1 86 if the physician attained the full amount of the 'floating sixpense." The British Medical Association refused these demands advising that the medical men should demand free choice of physicians with remuneration for attendance and not capitation. This the government refused The second day after the act had gone into effect 10 000 physicians had accepted service, and a week later 15 000 were on the panels The British Medical Association acknowledged its defeat by releasing its members from their pledges, thus permitting any physician to enroll This controversy between the British Medical Association and the government was, however, the cause of many of the difficulties arising in the administration of the act which might otherwise have been avoided, and produced regulations for medical benefit that were hastily drawn

REGULATIONS FOR MEDICAL ATTENDANCE

The English act guarantees adequate medical attendance and treatment to the patient, but the panel physician contracts to give only such treatment as is of a kind which can consistently with the best interests of the patient be undertaken by a general practitioner of ordinary competence and skill, and, further, when the condition of the patient is such as to require services beyond the competence of an ordinary practitioner, the practitioner shall advise the patient what steps to take so as to obtain the treatment his condition may require These medical regulations are made by the English Insurance Commission so they are uniform throughout England On this basis, therefore, Roentgen-ray diagnoses, pathologic and bacteriologic examinations, major operations or other operations requiring an assistant in addition to the practitioner and the anesthetist are not included under these ordinary services Any physician is not expected to render any service that an ordinary practitioner cannot render even if the doctor possesses the adequate skill However, if an emergency arises which makes this extra service imperative, if the doctor is able to supply it, he is in duty bound to perform it. To all patients needing more than the ordinary care of the average general practitioner, the act and regulations simply provide that this general practitioner shall furnish advice as to how these extra services may be obtained, but there is no provision in the medical regulations or act for the furnishing of these extra necessary services Herein lies a serious weakness of the English insurance act.

These regulations state that the normal method by which the insured persons may obtain their care and treatment is by the panel system Every insurance committee is required to adopt this panel system unless the commissioners are satisfied on inquiry, that it does not afford adequate medical service when other medical methods may be adopted, provided these give as good service as the panel system should give The insurance committees form the panels of practitioners There may be formed by the committee different panels for each convenient district of the area under the committee Every practitioner has the statutory right to act on any panel on the terms and conditions offered by any insurance committee in respect to that panel. The committee cannot exclude any practitioner or remove a practitioner A practitioner may, if he sees fit, be a member of more than one panel Thus a physician living near the boundary between two counties may be on the panel of each county Every insured person who is entitled to attendance and treatment from the practitioners on the panel is free to select his own physician subject to that physician's consent. Those who make no choice and those who are refused by the physicians to whom they first apply will be distributed to the physicians on the panel This distribution as far as practicable will be made by the practitioners on the panels themselves Each physician must fix hours of attendance for seeing at some place appointed by him persons requiring his services, whose condition does not necessitate his visiting them Practitioners in the district arrange with the insurance committee for an hour to be fixed on or before which messages for visits must be sent by the insured person whenever practicable. In a district where partial or complete payment per attendance is adopted, special fees will be paid for visits made in response to a message received after the hour thus fixed and on the same day on which the message is received Physicians have to keep certain definite prescribed records, and each insurance committee makes provisions for the infliction of penalties on insured persons who make unreasonable demands on the physicians to whom they are assigned.

In 1912 disputes between two practitioners on the panel were referred to the local medical committee to take such action as they might think necessary Questions arising between physician and patient which cannot be adjusted through the principles of free choice and the physician's right of refusal of a patient may be referred by either party to the medical service subcommittee, which consists of three physicians chosen by the local medical committee, three insured persons and a chairman chosen from those members of the insurance committee who are appointed by the county or county borough council or from those appointed by the commissioners If the insurance committee finds the insured person at fault, it may transfer him to another practitioner or fine him or, in the case of repeated offense, suspend him from benefit If the practitioner is found at fault, the patient may be transferred to another practitioner, but the committee cannot remove the practitioner from the panel or inflict any penalty beyond the transfer of the patient The removal of a practitioner can be made only after an inquiry conducted by a committee of inquiry especially appointed by the insurance commissioners for the purpose This committee of inquiry must consist of two members of the medical profession and one barrister or solicitor in actual practice appointed by the insurance commissioners The commissioners can proceed only on the result of such an inquiry

After a year's working of the act it was found that this local medical committee, which was composed of all the practitioners in any county or county borough, was insufficient to give justice to physicians working on the panel, and a special panel committee was passed in the amendment to the national insurance act in 1913 and all questions regarding the attendance and treatment of the insured persons must go through this local panel committee Where no other local medical committee had been appointed, this panel committee should be recognized as the local medical committee It was further provided in 1914 that all disputes were referred to medical service subcommittees appointed by the insurance committees as follows each committee to consist of three persons or, by consent of the insurance commissioners, five persons, one person appointed by the local medical committee and a sufficient number of the panel committee so that the representatives of the local medical committee and panel committee shall equal the number appointed by persons representing the insured persons, "provided that unless the person appointed by the local medical committee or one of the persons appointed by the local panel committee is a woman, at least one of the persons of the committee representing the insured persons shall be a woman, but the woman so appointed may be a person who is or is not a member of the committee" The chairman shall be selected from the members of the committee who are not insured presons, practitioners or registered pharmacists Similar pharmaceutical service subcommittees are appointed for dealing with any complaint from a person entitled to receive treatment from a practitioner on a panel against a person supplying drugs or appliances in respect of the quality of the drugs or appliances supplied or in respect of the failure to supply such articles These committees are made up of three members of the committee representing the insured persons and three members of the pharmaceutical committee There is the same proviso that one member of this committee must be a woman There are also provided the joint service subcommittees between the medical service subcommittees and the pharmaceutical service subcommittees These joint service subcommittees deal with any disputes in which pharmacists or physicians are both involved Questions arising between two practitioners involving questions of the efficiency of the medical service of insured persons still come before the local medical committee, not before the panel committee, and the local medical committee may request the commissioners to remove any practitioners from the panels The panel committee has the further duty of investigating the character and amount of drugs and appliances ordered for injured persons by practitioners on the panel, and if it is found that the cost has been in excess of what may be reasonably necessary, the panel committee can recommend to the insurance committee the amount that should be recovered from the practitioner This may be recovered by deduction from the amount payable to him in respect of any year, and the funds so recovered shall be paid to the practitioners' fund

All decisions between the panel committee's subcommittees and insurance committees are subject to appeal to the insurance commissioners If a question arises that a practitioner has failed to perform any operation or service which can consistently, with the best interests of the patient, be undertaken by a practitioner of ordinary competence and skill, the question should be referred to the local medical committee. If the local medical committee and the insurance committee cannot agree, the questions are referred by the commissioners to referees especially appointed These referees shall be chosen as two practitioners selected from any panel of practitioners set up by the joint committee for the purpose, or if no such panel exists, from any practitioners in Great Britain and one barrister of law or solicitor in actual practice. The joint committee here referred to is the joint committee panel of insurance commissioners of England, Ireland, Wales and Scotland The decision of these referees shall be final, and the referees in giving any decision shall state whether in arriving at their decision they took into consideration the practice and medical customs peculiar to the area in which the question arose When appeals are taken to the commissioners, the commissioners may authorize any two or more of the commissioners to hear and determine questions or appeals, and any decision of the commissioners or any of them made under this article of appeal shall be final The insured persons, unless through an appeal to the local committee, cannot change their panel except at the end of the year, and must notify the committee by the first of December of each year if they so desire to change. A practitioner cannot retire from the panel except at the end of the year, and must give notice not later than six weeks before the commencement of the year If, however, a practitioner wishes to discontinue practice, he must give two month's notice or, by special arrangement with the committee, he may discontinue at shorter notice

Any insured person may, on application, be allowed by the insurance committee to make his own arrangements for medical treatment, receiving from the medical benefit funds of the insurance committee of his area a contribution toward the cost If the income limit has been fixed locally, those whose incomes exceed that limit will be required to make such arrangements if they desire to be insured

METHODS OF REMUNERATION

Remuneration to the practitioners is made through the insurance committees The method which is adopted rests with the insurance committee, subject to the approval of the insurance commissioners, but in practice it was decided in accordance with the preference of the practitioners on the panels, the amount received by each doctor depending on the method adopted As a matter of fact, a straight capitation system has been adopted in all except Salford and Manchester, where a payment by attendance has been chosen The methods permitted under the law are straight capitation, that is, so much per patient per year This is simply for attendance on the insured person and does not include any income derived from attendance on wives and families of the insured, and on the uninsured classes The physician is paid for the number of patients on his panel at a certain definite time, the payment for each quarter being the average of those on his list on the first day of the quarter and those on his list on the last day of the quarter The regulations further provide, besides this capitation schedule called Schedule A, other schedules of B, C, D and E Schedules B and C are schedules of capitation system plus the payment for special services, the details of the special service simply being different in the two schedules, Schedule C dividing more minutely than Schedule B the special work which, according to the schedules, should be left to the choice of the practitioners of the neighborhood Capitation plus special services, however, can be regarded from two standpoints They can be regarded from the standpoint that the general capitation fund shall take priority over the special service fund and shall be paid first to the practitioners In occasions in which there is insufficient amount to pay for special services given, the value for each service shall be reduced but the capitation prices shall remain fixed On the other hand, in Schedule D of the regulations, the reverse is made possible so that the fund for special services shall take precedence and be paid in full, and if there be excess of such services, then the amount in the capitation fund shall be proportionately diminished and be paid last The regulations provide for the appointment of practitioners on the panel to protect against the overcharge of any individual practitioner

The other method allowed is payment by attendance Here all services are paid according to rates fixed for special services, that is, visits to patient's residence, attendance on patient at the practitioner's residence or dispensary, special visit—that is, visit paid by the patient's desire on the same day as the call received after a certain designated hour in the morning or on Sunday, night visits—that is, calls between 8 p m and 9 a. m in response to a call received during those hours, or treatment of abortion or miscarriage so far as not included in maternity benefit, setting a fracture, reduction of dislocation, administration of general anesthetic for the purpose of any operation included in any medical benefit treatment, or tuberculosis so far as the patient is not entitled to receive sanatorium benefit There is also in the regulations a fee bill entitled "A Scale for Calculating Remuneration in Respect of the Treatment of Temporary Residents"

DRUGS AND APPLIANCES

The insurance committees have drawn up a list of drugs ordinarily supplied Anything not included in the list must be subscribed on a special form This list is a matter of agreement between the physicians, the pharmacists and the insurance committee of each area. Physicians cannot dispense medicines Except in certain rural areas, by special permission of the insurance committee, they can supply drugs and will be given a capitation fee of $2 12 per person If they care for tuberculosis in this area, their capitation fee becomes $2.25 There are also special regulations for certain sparsely populated areas in which there are special grants made for mileage.

The working of the insurance act of Great Britain has brought out many unexpected factors First that the amount of sickness among the people was vastly more than even the physicians working among the poor had any conception of It was calculated that 60 per cent. of those on a physician's panel would come to him during the year for treatment. It was found with those caring for women that the sick rate among them was as high as 100 per cent. more than was calculated, and many were surprised to find how really ill and ailing many of these women had been, although dragging on with their work In some panels in London the sickness was as high as 81 and 88 per cent of the panels, and among the very poor in the city it was realized that they really had not been able to earn enough money to give them proper food by which they could be nourished to do their work, and there was a vicious circle of poverty, starvation and unemployment and sickness which began to be broken only when medical care attempted to increase the nourishment necessary to gain some measure of health

In the drug tariff in which certain lists of appliances are given, consisting of bandages and surgical dressings of simple kind, ice bags splints and catheters were the only other appliances furnished Trusses and spectacles were not included, even in the first instances of injury This is widely different from the German system, in which the spectacles and trusses are furnished in order that the workmen may go back to their work as soon as possible and keep off the sick lists In England there has been rather a "penny wise pound foolish" policy pursued because many insured persons have been kept on the weekly sick benefit lists who would have gladly gone to work but have been unable to do so because unable to buy spectacles or trusses out of their own pocket and the societies have been unwilling to furnish them although the price for these appliances was no more than a single week's illness of an individual

FACTS BROUGHT OUT BY FABIAN COMMITTEE

In general according to the Fabian Committee report the free choice of physician has not produced anything like an even distribution of the patients among the physicians The Fabian Committee asserts that in town after town for which it has the figures, about one fifth of the physicians on the panel were caring for one half of the insured persons, while four fifths of the physicians divided among themselves in comparatively small numbers the other half This gives the inevitable results of capitation and the same evil results as under the old lodge practice The report goes on to say that there is one case of the physician who pays, it is true, four assistants whose names are on the panel, together with a secretary and a nurse, having on his list just under 9,000 insured patients in addition to an extensive private practice There are many instances of physicians undertaking from 3,000 to 4,000 insured persons, sometimes without regular assistants "We notice with some surprise that even with these crowded lists, and in addition to waiting for hours, only the smallest fraction of insured persons have for any reasons whatsoever taken the trouble to change doctors Judging from the statistics we have seen, the changes do not average *from 1 per cent. to hardly 2 per cent* per doctor We consider that the medical attendance and treatment thus provided has various defects and shortcomings, in small matters and in great, not perhaps wholly or mainly the fault of the doctors themselves, which call for prompt amendment, and that it falls far short of the medical attendance guaranteed by the Act" The Fabian report also explains that the kind of service given was only for relatively slight ailments, and that the special treatments of eyes, ears, etc., and the really serious cases requiring hospital care, were not properly cared for

The working of the act brought out the fact that England lacked adequate hospital accommodations Previous to this the Fabian Committee asserts that not one county in England had a number of hospital beds equal to the low standard of two per thousand of the population In France the law requires that there shall be one bed for every 500 or fraction of 500 inhabitants, in Germany the necessity is reckoned as at least five per thousand in towns and three per thousand in the country

THE MATERNITY BENEFIT

The most serious breakdown in the English law has been in the administration of the maternity benefit. It was early found that it was a necessity that the money payment should be made to the woman herself and not to her husband except by her order In calculating on the premiums and not including the actuarial calculation for the sickness benefits of the English insurance act, the statistics of the Manchester Unity Society were taken This was a society composed entirely of men, and the actuaries loaded the benefits of these selected lives, allowing for various contingencies The actuarial errors were that no account was taken of the varying difference in sickness of different trades and the big variation of sickness occurring between men and women and married and unmarried women Calculating from the lives of selected men, the actuaries had forgotten all about pregnancy and sickness pertaining thereto

The sum total of sickness calculated for occurred as figured Many approved societies finding that their reserves were disappearing and that they were liable to be bankrupt, decided that pregnancy or any sickness due to it was not a disease but a disturbance of the normal functions and refused to pay for sickness due therefrom This has caused a great deal of hardship and indignant criticism In the report of the Departmental Committee on Sickness Benefit Claims, under the national insurance act, it was recommended that the financial burden of benefits necessary to provide the proper care for pregnant women should be removed from the funds of the approved societies and placed under the insurance committees, special funds being provided for this purpose They made the further recommendation that the new benefit to be created should be paid to a pregnant woman in the last four weeks of pregnancy whether she was incapacitated or not and that payment should be paid to the woman who was incapacitated from following her occupation the month previous to the last month, whether she was incapacitated by her pregnancy alone or by pregnancy accompanied by some other condition.

REFEREES

It has further been found that the panel physician cannot adequately cope with the decision when a patient shall go back to work In disputed cases there must be referees, and the committee just referred to recommended that referees be appointed by the commissioners and not by the approved society or by the physicians The referees should either be paid for full time or should be part-time referees, but should have the power of deciding when the patient shall be put off the rolls and be put back to work, and should be used also as consultants when a second opinion was needed by the panel physicians

The experience of the English law shows also the necessity of the referee to prevent valetudinarianism and malingering This is in accordance with the German experience already mentioned As, for instance, insurance companies in London and Bristol appointed referees to whom both physicians and societies could send doubtful cases for a second opinion In London 700 applications were made in two months' trial of the system Of the 375 persons who were examined, 208 were declared capable of work, 167 remained on the funds of their cieties, and 76 other persons failed to attend the examinaon, saying they were going to declare off[9] In eleven months e Bristol referee had 600 cases sent him, 197 by local physicians, and 403 by approved societies Of this number 240 were declared fit, 205 unfit, and 145 either did not attend the examination or returned to work

Another valuable work of the referee would be to standardize the giving of certificates by physicians and the standardization of what constituted "incapable of work" At present there is no control of the physicians on the panel in this respect

MATERNITY INSURANCE

Maternity insurance is of such importance that it seems wise that special attention should be paid to it and that it should not be passed over with a mere casual reference in considering the insurance laws in Europe Dr Lee K Frankel[10] sums up as follows, what has been done in this subject both in Europe and in the United States

"The industrial code of Germany forbids women's work during four weeks after confinement, and permits it during the next two weeks only on the certificate of a physician In Austria the law requires a rest period of four weeks after childbirth, and in Switzerland there is a rest period of two weeks before and six weeks after childbirth France has also enacted a compulsory rest period of eight weeks, which are to be equally distributed before and after childbirth Seven weeks of rest are required in Italy A rest of four weeks after childbirth is demanded by the Belgian and Portuguese laws, and the same period, which may be extended by one or two weeks through a medical certificate, is required under the law of Spain Holland and Norway have both instituted a compulsory rest period of four weeks, and Sweden has a six weeks' rest period law Great Britain prohibits the employment of women within four weeks after childbirth It is of interest to note that in the maternity insurance legislation which has resulted from these attempts to protect motherhood, the unmarried mother, as a rule, is given the same consideration as her married sister"

In Germany the war at first cut down the sick benefits considerably and especially the maternity benefits, but in December, 1914, these confinement benefits were again voted in the war relief Those uninsured wives of insured participants in the war are entitled to a single payment of 25 marks toward the cost of confinement, with 1 mark a day for a period of eight weeks, of which at least six must be after the actual confinement, and aid up to 10 marks for the ailments of pregnancy and nursing pay up to the conclusion of the twelfth week after confinement, to the amount of one-half mark a day The maximum expenditure permissible in each case is 133 marks All costs are borne by the empire In the case of insured wives of insured participants, the confinement pay is furnished by the society and the remaining benefits are given by the empire The insured wives of uninsured participants are entitled only to the benefits guaranteed by the society, and all costs must be borne by the societies

"In the United States, legislation directly affecting motherhood is much less common than in Europe, owing in all probability to the more recent entrance of married women into factory life Laws regulating rest periods before and after confinement have been enacted in Connecticut, Massachusetts, New York and Vermont In Connecticut a compulsory rest period of four weeks before and four weeks after childbirth is provided In Massachusetts there is a compulsory rest period of six weeks, two weeks of which are before childbirth New York does not provide for a rest period before childbirth, but the employment of women is forbidden for four weeks after this time The requirements of the Vermont statute are the same as those of Massachusetts

"Indirect provision for the protection of motherhood is found in the statutes of various states Conditions of labor of women are carefully regulated in a great many Women are forbidden to engage in certain occupations For example, in Alabama mine work is not allowed, in Arizona women are not allowed to work in saloons Colorado, Illinois and Indiana have a provision similar to that of Alabama Iowa and Louisiana forbid work in saloons These laws, as well as many others for the protection of the woman wage earner, while not primarily designed to protect working mothers, have, it is safe to say, the indirect effect of protecting the children of the next generation

"Another group of laws more general than these limiting occupation, but with probably the same indirect intent and effect, are those specifying the maximum working day These laws are general in almost all states California and Washington limit the working week of eight hours a day, while South Carolina has a maximum of twelve hours a day and sixty hours a week

"It is interesting to note in these various laws that the lowest number of hours and the most stringent regulations of the conditions of work are found in the Far West. Specific regulations forbidding work during and after pregnancy, however, appear only in a few of the most densely settled manufacturing states in the East.

"Minimum wage legislation, although not specifically directed toward the protection of mothers, aims very definitely to provide women with a sufficient salary so that their health and morals may be preserved It seems reasonable to suppose that one of the underlying purposes of this is to protect the future mothers The following states have enacted such legislation California, Colorado, Massachusetts, Minnesota, Nebraska, Oregon, Utah, Washington and Wisconsin"

Frankel further quotes Mayet of Berlin that it is self-evident that the physiologic needs of the mother and of the child are fundamental at the threshold of the infant's life, and that sickness and death are the punishment for the neglect of these laws Maternity insurance is a necessity to assure the working classes of the physiologic needs of the pregnant woman and her infant The Bohemian Sanitary Report is quoted to prove that the high rate of stillbirths in northern Bohemia is explained by the fact that women work up to the end of pregnancy in order not to forfeit their membership in the societies, and in France it has been found that the average duration of pregnancy is within the normal period of 269 days among women who observe a rest period before confinement but only 247 days among those who do not It is also said that the large measure of the abdominal diseases of the women of the working class is attributable to the fact that they are unable to obtain that rest after confinement which Nature demands The extent to which this is true cannot be deduced from statistics, but in the testimony before the Departmental Committee on Sickness and Benefit Claims, in England, it was brought out that the large increase of sickness among the married working women was due, in a great measure, to the lack of care in childbirth and to their returning to work too early Moreover, the English insurance act has brought out these facts to a degree which has astonished the physicians

In the care of children after confinement, the mortality among the bottle fed is notoriously greater than the breast fed, and the mortality is determined not only by the fact of breast feeding but also by its duration Roese of Dresden found that the extent of dental decay and rickets varied inversely with the duration of breast feeding On the basis of statistics of military recruits it has been proved that the weight chest and other measurements of adults varied greatly with the duration of the period which, as infants, they were fed at the breast. The same relationship is evident between breast feeding and efficiency in school These facts have been found by Friedjung, Groth and Hahn

[9] Halsey, Ol[illegible] S Thesis on the British Health Insurance Act

[10] Frankel, L K Maternity Insurance, New York Med Jour, Dec 18, 1915

The following benefits and protection are deemed by Mayet a necessity in any scheme of maternity insurance a rest period before childbirth, with full compensation for wages lost, aseptic conditions of birth, and obstetric aid by a midwife and, if necessary, by a physician, a rest period after childbirth, with full compensation for wages lost, in case of necessity maternity care, either at home or in an institution, extension of the period of breast feeding by means of nursing benefit, and, if necessary, a pecuniary aid toward the nourishment of the infant.

"In Australia an entirely different philosophy underlies the maternity allowance provision, which also dates from 1912 In all other countries there are salary limits to the employment benefits, contributions are made by the workers, or by the employers and employees, and, in some cases, there are state subsidies In Australia, however, a gift of 5 pounds is made by the Commonwealth to each mother on the birth of a child *This covers all classes in the community,* and cannot properly be classed as insurance."

HEALTH INSURANCE IN THE UNITED STATES

The general situation in the United States today is similar to that in England and Germany before the passage of their comprehensive health insurance laws No state, municipal or other government in any way provides for or aids health insurance, according to the latest bulletin on health insurance of the Treasury Department. Medical benefit, however, is generally granted by both state and municipal authorities in the public hospitals which are supported so generally throughout the Union, for hospitals are nothing more or less than that amount of medical benefit which the community is willing to give for its own or neighboring sick poor And the same can be said of the free dispensaries Both state and municipalities go further and provide sanitation and preventive medicine through the various departments of health As a rule, this extends only to the communicable diseases under the sanction of the police power of the state In some instances, as in the New York City health department, therapeutic procedures are also added to the benefits given often in the homes, as, for instance, free diphtheria antitoxin and free meningitis serum given by trained inspectors on the advice of any physician to the poor at any time The New York health department goes farther and manufactures these substances, its laboratories adding also in no small degree to the scientific advancement of medicine in subjects relating to communicable diseases New York City also supervises the health of the children in the public schools both by physicians and by nurses Its services are mostly toward the prevention of disease, but in the special group of communicable diseases an enormous mass of work is done in their care and treatment. This care has developed from the necessity of absolute control if real prevention and limitation are to be obtained. Public care of the insane is in reality the permanent care of mental invalidity, and the public epileptic colonies are founded on a similar basis

Other evidences of health insurance are shown in the benefits given by the trade unions, both national and local, by employers' organizations for benefit of employees, such as the railroad funds and the establishment funds, mutual societies—that is, the fraternal orders, local lodges, general benefit societies and special sick benefit funds—and commercial companies operating for profit or on a mutual principle that is, industrial insurance companies and casualty companies doing industrial insurance The trade unions probably take in about 10 per cent. of the total number of the wage earners They are the only organizations which so far have successfully dealt with unemployment insurance. They are especially fitted for the carrying out of sickness insurance through their local lodges because members of the local lodge have a mutual supervision and restraint on each other All are practically subject to the same environment, and all possess approximately equal chances for health or sickness

BENEFITS BY TRADE UNIONS

In some of the large national trade unions the national body pays the disability and death benefits while the local bodies control the sick benefits Many of these unions do not pay for sickness for less than a week, and a week's waiting period is required Others begin payment after fourteen days, but pay then from the first day of illness Death benefit of various amounts is the most universal benefit paid Temporary disability, which is really sickness insurance, is not as commonly paid as permanent disability, and this last serious condition is paid by lump sum of the same amount as the death benefit, sometimes the payment of this permanent disability benefit disentitles the member to any other form of benefit, and unions paying the permanent disability benefits usually require a longer term of paid premiums for members who become entitled to this benefit than is required for members who become entitled to death benefits, the usual requirement being from one to two years In the report of the commissioner of labor,[11] it is stated that the generally accepted definition of permanent disability is the loss of a hand at or above the wrist joint, the loss of a foot at or above the ankle joint, the loss of one eye or both eyes, or a permanent disability caused by paralysis A few unions pay superannuation benefits as a lump sum per month through life, there is one union that pays $10 per month for six months in the year The cigar makers' union disguises this old age pension under the form of "out of work benefits," and a large number of recipients of this relief (according to Henderson in "Industrial Insurance") are infirm persons who cannot earn the average wages, and many of these are advanced in years This keeps them from going into the market on very much reduced wages, which they must take if unable to subsist.

Table 6 shows the kind of benefits paid in the 530 funds of the trade unions reported on nine years ago (1907) in the Twenty-Third Annual Report of the Commissioner of Labor It is given here as showing the type of relief which the trade unions give to their members

TABLE 6—BENEFITS PAID BY TRADE UNIONS

Kind of Benefit Paid	Number of Funds	Number of Members	Number of Persons to Whom or on Account of Whom Benefits Were Paid
Temporary disability	346	102 800	9 117
Death of member	401	133 821	1 472
Death of member's wife	86	26 790	111
Death of other dependents	40	10 190	179
Unemployment	10	3 398	424
Permanent disability in lump sum	3	1 730	
Permanent disability in form of pension	7	10,374	106

Of the 530 funds investigated 346 paid benefits on account of temporary disability of members, and of the 102 800 in the 345 funds which reported the number of benefits paid 9,117, or nearly 9 per cent., received benefits for temporary disability during the year previous It is further shown by this table that the death rate among these unions was about eleven per thousand members, for the death benefit funds have in the 395 trades reporting concerning this item 133 821 members and had paid 1,472 death benefits It is further interesting to note that in the ten funds paying benefits to members when out of work, nine reported statistics on this point that out of a membership of 3 898 unemployment benefits were paid to 424 members, or about 12 per cent., during the year It so happened that in the three funds paying permanent disability in a lump sum no member was entitled

---

11 Twenty Third Annual Report of the Commissioner of Labor, 1908

privilege of still having the insurance by being taken into another order by arrangement made in the liquidation These two societies are fair examples of instances in which, with inadequate rates, an attempt is made in voluntary insurance to keep up the increasing strain of advancing age and the increasing death rate Many of these fraternal orders, outside of their social or religious ceremonies, give life insurance, many of them in their lodges give medical benefits and cash benefits during sickness or injury They have generally among their membership the better paid classes of workmen and the more thrifty of employees on small salaries

Important and large as their insurance business is, it does not reach the really poor whose need is greatest, both for the protection against sickness and for death when it occurs Although many local lodges of the fraternal societies give, as it has just been said, sick benefits and medical benefits, they do not compose the majority of the so-called lodge practice When one speaks of lodge practice, what is usually referred to are usually small localized mutual benefit societies These are often formed of various races in which the binding element is origin from a single region abroad or the bond of one language at a time when its members are too recently arrived in this country to speak or understand English, or where, in the large cities, many foreigners are massed together living on low wages, and find that some form of mutual insurance against the calamity of individual sickness must be obtained to protect them from the necessity of using the dispensaries for their minor ailments and going to the public hospitals when seriously ill Their object in the latter regard is not always obtained, but it is an expression of the economic necessity which these people seek in the insurance idea for their protection

These lodges are almost invariably run on the system of capitation payment to the physicians, that is, so much per head per year There is competition among poor physicians, themselves struggling to obtain several lodges that they may eke out a meager income, and the commercial haggling by the officers of these lodges bidding down the struggling doctors to a minimum so that all the evils of the system are brought out in full force Underpaid physicians, enormously overweighted by large panels of people to take care of, result in inadequate remuneration to the physicians and inadequate care to the sick. The physician loses his self-respect from knowledge of the kind of service he is giving he is held in contempt by his patients The whole service and the capitation system under which it is possible is held as the criterion of what is dishonorable and contemptible in the practice of medicine The results to the unfortunate physician who must give this service are disproportionately severe for his responsibility in the matter The vicious circle is formed by certain economic situations, and this circle cannot be broken except by a change of the economic forces Compulsory insurance by the state can alone solve these economic problems of the very poor and release the unfortunate physician who, facing starvation, must accept this lodge practice

COMMERCIAL INSURANCE COMPANIES

There remain to be considered the commercial insurance companies giving so-called industrial insurance or giving health insurance The so-called industrial insurance is practically funeral insurance or death benefits among the poor This amounts to enormous sums in the United States In 1881 the average per policy was $91, in 1911 this had risen to $138 This does not mean any increase in the protection that a person in his last illness may obtain, but it means the increased amount of extravagance with which the standards of burial have risen among the poor The self-respect among the poor demands that their dead shall be decently buried at their expense, and a pauper burial is considered with horror among them

The proportion of the population carrying industrial insurance in the United States is nearly 27 per cent. Thirty-two companies in 1911 were doing this business There was about $785,900,000 worth of insurance written during the year There were about 24,700,000 policies in force, the amount of insurance in force was about $3,423,000,000, the premiums received amounted to about $183,500,000, and the losses paid amounted to about $50,231,000 As Dr Rubinow expresses it, "It is too well known that the greatest portion of money paid out in industrial insurance claims readily finds its way into the pockets of undertakers as a result of deplorable extravagance in funeral arrangements, encouraged by a lifelong insurance for the purpose of a decent funeral" In New York State alone, in 1914, $29,223,000 was given in premiums for this burial insurance to the four companies doing this business The recent Mills bill for health insurance in New York State, if it had passed, it is calculated would have cost $30,000,000 That is, this law offered to the people of New York State, having an income of $1,200 a year or less, sickness insurance, funeral benefits and maternity benefits for only $1,000,000 more than they now squander in funerals alone The $183,000,000 paid in 1911 in this country for funeral insurance almost equals the total cost of the German social insurance system Thus the American working class pays for funeral insurance as much as is contributed in Germany by all three parties concerned—the wage-earners, the employers and the state—for accident insurance, sickness insurance, maternity insurance, invalidity insurance and old age insurance combined[12]

The insurance companies which give the industrial insurance, or burial benefit, attempted in their earlier history to provide sick insurance, but the amount paid for burial insurance alone absorbs practically the greater part, if not all, of the available resources for insurance purposes in the families of small income There was, however, an attempt made by these companies to provide sickness insurance, but the effort generally failed and had to be abandoned Henderson[13] quotes President Dryden of the Prudential Insurance Company of New Jersey as saying that a company which has its business scattered over a wide territory, and must act through salaried agents, cannot undertake sickness insurance, and that this form of insurance is possible only in brotherhoods or small groups in which the members know each other and can detect and discipline malingerers There is no question that these industrial insurance companies are at an enormous disadvantage in their endeavor to furnish any adequate sickness insurance that is at all available to the poor

At a hearing before the Committee on Labor of the Sixty Fourth Congress, held April 6, 1916, the testimony of the Hon Charles F Nesbit, superintendent of insurance of the District of Columbia, brings out this point in a very striking manner This testimony says that there are about 90,000 wage earning negroes in Washington They form most of the casual labor, not skilled labor, but servants and day laborers and drivers, and such workers as those Among these people there has grown up a system of insurance against sickness largely confined to the District of Columbia, Maryland, Virginia and the Carolinas, and somewhat in Tennessee. The greatest problem with these people is that when they become sick their pay stops This insurance is not confined to the negroes, but is used by the poor white people of the District of Columbia as well Mr Nesbit further says that there is a very strenuous effort on the part of these poorly paid people to provide against sickness, but this commercial insurance is a very inadequate way of providing it, since they pay $500,000 a year in premiums and out of that all they get back is $200,000 The companies pay practically sixteen claims out of every seventeen claims made to them, practically 94 per cent of all claims put in, and yet the result is that every time $100,000 is collected from the poorest citizens of the foregoing territory, it costs $60,000 to collect it and $40,000 is all that is paid back The expenses, of course, of collecting this amount are extremely high because the premiums are collected in small amounts, of 10, 15 and 25 cents a week, and agents must collect it by going from house to house This 60 cents out of every dollar is made up of the administration expenses of overhead charges, of fees to the agents and of profits

This shows the difficulties of the situation of the insurance companies endeavoring to give sickness insurance Because of inadequacy of control by the companies of their insured people scattered over wide areas, because of the necessities of the manner in which they must carry on their business, it is an impossibility, with the best of intentions, to give an

adequate health insurance to the really poor who are in the greatest need of this protection

REPORT OF THE COMMISSION ON INDUSTRIAL RELATIONS

These statistics show in general the mass of systematic and yet incoordinated attempts that have been gradually developing to bring about health insurance in the United States In the final report of the Commission on Industrial Relations, which was formed by act of Congress in 1912, we find the following conclusions based on the findings of Dr B S Warren of the Public Health Service

"Each of the thirty-odd million wage earners in the United States loses an average of nine days a year through sickness At an average of $2 per day, the wage loss from this source is over $500,000,000 At the average cost of medical attendance ($6 per head per year) there is added to this at the very least $180 000,000

Accidents cause one seventh as much destitution as does sickness and one fifteenth as much as does unemployment A great deal of unemployment is directly due to sickness, and sickness in turn follows unemployment. Sickness among wage earners is primarily the direct result of poverty which manifests itself in insufficient diet, bad housing, inadequate clothing, and generally unfavorable surroundings in the home The surroundings at the place of work and the personal habits of the worker are important but secondary factors"

This emphasizes the well known vicious circle of sickness, unemployment and poverty

The commissions recent study in Indiana showed that 17 9 per cent of the unemployment among women in stores in that state was due to illness In 1901, a federal investigation of 25,440 families showed that 11.2 per cent of heads of families were idle during the year because of sickness and the average period of unemployment was 7 71 weeks Other investigations show that from 30 to 40 per cent of cases requiring charitable relief are immediately due to sickness

The responsibility for the disease-causing conditions rests on the employer, the public and the employee The employer s responsibility includes, besides conditions causing so-called occupational diseases, low wages, excessive hours, methods causing nervous strain, and general insanitary conditions The public has in part recognized its responsibility in such matters as housing water supply foods drugs and sanitation The greatest share of the responsibility rests on the individual, and under present conditions he is unable to meet it This inability exists on the fact that the majority of wage earners do not receive sufficient wages to provide for proper living conditions and because the present methods of disease prevention and cure are expensive and sickness is most prevalent among those who are least able to purchase health The worker is expected to provide for almost certain contingencies in the future when he lacks means of existing adequately in the present. If a rapid increase of wages were made to all classes of workers to a standard which would permit proper living conditions and adequate medical attention, it is believed it would solve the problem but there is no indication that this will occur The remedial measures for existing conditions must, therefore be based on the cooperative action of those responsible for conditions, must be democratic in maintenance, control and administration, must distribute costs practicably and justly, and must provide a powerful incentive for sickness insurance.

A system of sickness insurance is the most feasible single measure This conclusion is based on the following

> The losses occasioned by the wage earner's sickness affect employee employer and community all of whom share in the responsibility Insurance is the recognized method of distributing loss so as to reduce individual risk to a minimum
>
> The strongest incentive—that of lessening cost—is given to efforts to diminish frequency and seriousness of losses, sickness insurance in this respect is a preventive measure of a positive and direct kind The lower the morbidity and mortality rates the less the amount necessary for benefits and the lower the insurance rate
>
> Sickness insurance is no longer experimental in the United States there being several million workers so insured The cost would be no greater than at present. The conclusion appears sound that medical benefits of $7 per week for a period not exceeding twenty-six weeks in one year, and death benefits of $200 can be provided at a total cost of 50 cents per week per insured person Budgetary studies of large numbers of workingmen's families show that under present conditions from 25 to 50 cents a week, up to 70 cents and even $1 86, is spent for little more than burial insurance Workers would thus receive immeasurably greater benefits for much less than they now pay"

It is suggested that the commission recommend a federal system of sickness insurance constructed along the lines here briefly summarized [14]

1 *Membership*—The membership shall comprise all employees of persons, firms, companies and corporations engaged in interstate commerce, or whose products are transported in interstate commerce, or which may do business in two or more states The employees of interstate establishments to be permitted to be insured if they so elect, under regulations to be prescribed by the commission

2 *Fund*—The fund is to be created by joint contributions by employees, employers and the government, the last named sufficient for expenses of administration Such contributions should probably be in the proportion of 50 per cent from workers, 40 per cent from employers and 10 per cent. from the government Individuals or groups desiring larger benefits may arrange to make larger payments, and the rate in any trade, industry or locality may be reduced where conditions so improve as to make a lower rate adequate The contributions are to be secured through taxing each interstate employer a certain amount weekly for each employee, the part contributed by workers to be deducted from their wages, thus using the regular revenue machinery of the government

3 *Benefits*—Benefits to be available for a limited period in the form of cash and medical benefits during sickness, nonindustrial accidents and childbearing, death benefits to be of limited size and payable on presentation of proper evidence

4 *Administration*—The administration of the insurance funds is to be carried out by a national sickness insurance commission The national commissionn should be composed by presidential appointment with senate confirmation, of a director (who would be chairman), representatives of employers and representatives of employees in equal ratio, and, as ex officio nonvoting members, the federal commissioner of labor statistics and the Surgeon-General of the Public Health Service. The commission should be empowered to supervise all funds and determine their character and limits of jurisdiction, promulgate all regulations necessary to enforce the act, establish and maintain hospitals, maintain staffs of medical examiners, specialists, dentists and visiting nurses, provide for medicines and appliances, make contracts with local physicians, cooperate with local funds and health authorities in disease prevention, and provide for collecting actuarial data

Correlation of the insurance system with the medical profession the lack of which has been a serious defect in German and British systems, is absolutely necessary Contracts with physicians should allow to each a per capita payment for the insured persons under his care, the right of selection of physician to be retained by the insured For the signing of certificates entitling the insured to benefits and for treating the insured in hospitals, the surgeon-general should detail physicians from the Public Health Service, their entire time to be given to these and other duties (consulting with local physicians, enforcing federal laws and regulations, and cooperating with local authorities)

ADVANTAGES OF A GOVERNMENTAL SYSTEM

Warren and Sydenstricker,[15] in their report on "Health Insurance Its Relation to the Public Health" further point out that the democratic character of an effective health insurance system is most pronounced in a governmental system The wage earner has a more real basis for feeling that the benefits he receives are rights to which he, as a citizen is entitled A governmental system removes all trace of the taint of charity which so often accompanies employers' welfare work and which might accompany a private plan supported in part by employers Certain features necessary to the success of health insurance which are obnoxious to this benefit The seven funds that gave pensions for permanent disability gave these pensions to about 1 per cent of their members during the year previous Of course, if figures on similar points could be obtained today, there would be a great variance with these figures of ten years ago, especially in the number of members in the trade unions Whether or not the ratio of temporary disability and permanent disability would be the same, it is impossible to say

---

[14] Final Report Commission on Industrial Relations 1915

[15] Warren B S and Sydenstricker Edgar Health Insurance Its Relation to the Public Health Bull. 76 Treasury Department, U S P H S pp 63-64

In considering the amount of temporary disability benefits, the recent passage of the workmen's compensation laws has modified greatly statistics obtainable on this point. It is interesting, however, to note that *of the 530 funds included* in the report, 346 paid benefits on account of temporary disability Four of those paid for disability resulting from sickness only, thirty-eight for accident only, and 304 for disability resulting from either sickness or accident The amount paid usually ranged from $2 to $5 a week The time for which these benefits were paid varied greatly in the funds, some funds having first, second and third periods for which they paid the disability The majority of the funds limited the periods to a stated number of weeks in each year or days in each month, while others limited them to disability In twenty-three funds the period for which payments are continued is unlimited Sixty-one of the 346 paying temporary disability limit the payments to thirteen weeks in each year, fifty-three limit them to a period not exceeding ten weeks in each year In some instances the duration of the period is determined by the age of the beneficiary when he joined the organization, in others the payments are continued to the end of the working season without regard to the time *of the beginning of the disability There is further variation* in the length of membership required before a member is entitled to temporary disability benefit In 157 of the 346 funds, members do not become beneficiary until six months from date of admission, in seventy-one, however, they are entitled to benefits at once In sixty a three months' membership is required, twenty-four funds require one year membership

To prevent malingering and valetudinarianism or fraud of any kind, some sort of supervision is exercised over members who claim benefits on account of temporary disability Of the 346 funds investigated, 279 require that patients be visited by sick committees, 257 require physicians' certificates, in twenty-seven, physicians' certificates may be required if deemed necessary, eight require visits by some officer of the society Many of the funds have more than one form of supervision, that is, more than 200 of the 257 funds which require physicians' certificates also require visits by sick committees

Many of the trade unions place certain restrictions on the action of members during the time they are drawing pensions for temporary disability In twenty-seven funds they are forbidden to use intoxicating liquors to excess, in one to frequent drinking places after 9 o'clock at night, and in twelve to frequent such places at all In fifteen they are forbidden to leave home at night, and in eighteen to leave home at any time There are various other restrictions, the violation of which usually causes a discontinuance of the benefits These funds vary greatly as to a continuance of benefits after the limit allowed is reached In 214 of them, members who draw benefits for the entire period are entitled to no more benefits for the same year, but in twenty-three of these there is provision for extending the time by vote of the members, and the twenty-three funds there is no limit to the time for which benefits may be paid In fourteen funds, after benefits are paid for the maximum period, no more are paid for the same disability

The amount of death benefit paid by the trade unions varies greatly In twenty-four funds there are more than one class of members, and each class is entitled to a different amount of death benefit In 322 of the funds mentioned here which have but one class of death benefit and pay a stated amount, benefits range from $375 to $20, about one third of the number pay $100, in eighty-two funds the benefit paid is $50, in fifty funds the benefit paid is $75 An amount based on membership is paid by fifty-one funds Ten of these funds pay an amount equal to 50 cents per member, and thirty-one pay $1 per member Ten funds have provisions for paying benefits to members who are permanently disabled by chronic illness or by the loss of some part of the body How much the latter clause may be affected by the workmen's compensation law it is impossible to say In four of these ten the benefit payments were made in lump sum, the amount in one being $40 and in another $100 In the third an amount is paid equal to 50 cents per member for certain disability by accident, such as one hand and one foot, or $100 per member for the loss of both hands, eyes or feet. In the fourth, the amount of benefit depends on the length of membership of the beneficiary, *ranging from $50 for six months'* membership up to $100 for five years' membership In six funds the benefit payment is in instalments, the period for which payments are continued being unlimited in each case. The amount paid is $4 per week in one fund, $3 in another, and $1 in another $10 per month in two, and $1 per month in the other These statistics are sufficient to give an idea of the kind and amount of benefits paid by these funds

Besides the benefits on the death of members, eighty-six of the funds have provisions for paying benefits on account of the death of a wife of a member, and one fund for female members pays benefit on the death of the husband of a member, the amounts paid varying from $12 50 to $112 50 The *most common benefit is $50 Forty of these 530 funds have* further provision to pay benefits to members on account of death of dependents other than wives, these dependents being children, parents, brothers, sisters, fathers-in-law, mothers-in law and other relatives Few funds include all of these, and about one half of the funds pay only for children, the amounts of the benefits varying from $10 to $100 Most of the funds pay more than one amount of benefit, the amounts varying according to the age or relationship of the dependent To give some idea of the amount paid during the year 1907 by the 530 funds investigated, Table 7 is self-explanatory

TABLE 7 —AMOUNTS PAID BY FUNDS

Kind of Benefit	Number of Funds		Amount Paid During Year
	Having Provision for Paying Benefits	Paying Benefits During Year	
Temporary disability	346	334	$198,189 50
Permanent disability	10	4	20,964 00
Death of member	401	311	181,643 81
Unemployment	10	8	29,417 60
Death of member's wife	86	47	6,470 50
Death of other dependents	40	32	3,859 00
Expenditure for hospitals	7	7	16,261 50
Total			$457,493 81

EMPLOYERS' ORGANIZATIONS

In the class of associations which the employers have organized for the benefit of employees are the railroad relief funds *and the establishment funds Of the first, in 1907,* the United States Bureau of Labor could only find fifty relief funds connected with thirty-seven railroad systems Thirty-six of these funds are insurance funds to which the employees contribute all or part of the revenues, fourteen are pension systems maintained entirely by the companies Of the 500,000 eligible employes, 300,000 were members of these funds Thirty-one funds pay benefit for temporary or *permanent* disability, thirty-four for death, and one for superannuation For thirty six of these insurance funds there is a managing board, some members of which are chosen by the employees In the majority of circumstances these boards pass on the claims to benefits Twenty-two of the funds are managed by the employees alone, and fourteen jointly by employees and company In each of these fourteen, some officer of the company is the supervising officer of the fund, the company often taking charge of the funds and guaranteeing the benefit payments The companies generally make substantial contributions

In thirty-three of these insurance funds the membership is optional The maximum age for admission to membership is generally the same as the company's service age limit, in eighteen funds it is 45 years, in four, 50, in one, 55, and in three, 60 years Eighteen of the funds require a medical examination for applicants, and nine others require that the applicant be in good health Three funds exclude colored employees In ten funds, persons leaving the service forfeit membership All other funds permit members leaving the service to retain membership or natural right death benefit, that is, death from natural causes Eight funds managed jointly contain provisions in their constitutions releasing the funds from all claims for benefits whenever a suit for damages is brought against the employing company In these eight funds the companies make contributions as follows one company duplicates the employees' contributions, one contributes 20 per cent. as much as the employees, three, 15 per cent , one 10 per cent , one, 2 per cent., and one, less than 1 per cent. Dues and assessments are usually paid in advance and deducted from the pay of the employees Thirty-one funds pay benefit for temporary disability The periods during which benefit payments may continue range from six to fifty-two weeks in one year The payments range from $2 50 to $20 per week. Usually after the first fifty-two weeks, the payments are half the original rates This unlimited period makes these payments in reality a permanent disability benefit Beneficiaries are visited usually each week by the sick committee and must furnish a doctor's certificate as often as required. Benefits are forfeited when a disability is caused or prolonged by carelessness, intemperance, immorality or unlawful conduct

Of the thirty-four funds paying death benefits, seventeen pay sums from $50 to $400, the other seventeen pay regular benefits of a maximum from $1,000 to $3,000, and of these seven (in all of which the company has a controlling interest) have optional additional death benefits for which additional dues are paid The highest total insurance which may be taken out in any fund is $6 000

* American Year Book for 1915, p 377

Besides the continuation of temporary disability or permanent disability, five funds pay lump sum benefits for various permanent disabilities ranging from $100 to $6,400, and one pays a monthly benefit of $5 To the fourteen railroad pension systems the employees do not contribute, they are all controlled and maintained by the companies These pensions are usually based on age and length of service, monthly payments for life usually being made on 1 per cent. of the average monthly wage for the ten years next preceding retirement for each year of service In most of the systems, pensions for superannuation are granted to employees retired at 65 or 70 years of age for from ten to thirty years of service and after incapacity of employees of from 60 to 69 years of age of like service The age limit for entering the service of these companies is usually 45 years The pensioners are allowed to engage in gainful occupations, but may not reenter the company's service.

ESTABLISHMENT AND NEEDS

The greatest growth probably in recent years has been in the formation of establishment funds or special insurance funds in which the employees of a single commercial manufacturing establishment or business form a more or less complete social insurance scheme for their protection Some of these are contributed to only by the employees, some are joint contributions of employer and employee, some funds are run entirely for the employees by the employer The membership in some is voluntary, in others, compulsory The met contribution varies, and the method of management varies It is impossible to go into the enormous details necessary to describe the many kinds of funds and benefits given under the separate establishments in this country The benefits vary all the way from sick benefits and death benefits up to the complete systems of accident and sickness insurance, maternity benefits and hospital benefits, permanent disability and old age pensions, some establishments having practically the most modern, complete social insurance systems with compulsory insurance, or all members of the establishment forced to go in and protect themselves These are in some cases connected with welfare work among the families of the employees, and with district nursing

There has been a growing realization in this country that a cheerful willingness to work goes with a healthy mind in a healthy body Public hygiene in communities and the full benefit of the protection that social insurance gives has been sought and used as a wise business policy A state wide health insurance would, in many instances, only carry out what has already been accomplished in many of these establishment funds

FRATERNAL SOCIETIES

There are other industrial benefit societies which differ from labor unions and establishment funds in that the membership, although composed generally of wage earners or of those on small salary, is not as a rule dependent on membership in any particular union or employment in any particular establishment The management of these societies and the administration of their affairs is entirely in the hands of the members It is also true that the membership of some of these societies is limited to the employees of a certain industry, the membership of others is limited to employees of certain industries of a certain locality Other such funds limit their membership to the employees of any industry of a certain locality while others extend their membership to the employees of any industry without reference to locality Some of these societies have restricted their membership to males while others admit both males and females In others, the membership is composed exclusively of women Some of these societies provide cash benefits in case of sickness, injury and death, some for sickness and injury only, and some pay only death benefits

In 1914, in 122 mutual sick benefit associations operating in the United States, the number of certificates in force at the end of the year was 1 072,764 Their total income was $7,246,000, and their premiums $646,588, their total expenditures were $6,169,000, they had paid to agents and for medical examination $1,587,000, and the expenses of management were $1,608 000 Table 8 best expresses the number of fraternal orders in the United States and the amount of business done by them

It is interesting to note that during the past year two of the oldest fraternal societies realized that they had become insolvent and were liquidated These societies had been in existence for over forty years and had been managed with integrity and economy, but the inadequate rates and the gradually increasing cost, with the increase in age of the members and the steady withdrawal of sound risks, caused their insolvency The assets amounted to a little over one half of the accumulated death claims in one case and something more than half in the other In the case of both these societies, however having received nothing in the liquidation except to private health insurance plans—for example, compulsory membership—are largely removed when health insurance is a public institution and a governmental affair Furthermore, experience has shown that there is a much higher degree of efficiency in management, and at much less cost, in government than in private health insurance plans The necessity for maintaining large reserves, providing profits, paying high salaried officers, soliciting agents, commissions, and general duplication of overhead expense is done away with in a governmental system The cost of administration is further reduced since already existing machinery for collection of the funds can be employed through the taxing power of the government, and a less complicated and elaborate organization of administration is necessary

It is further pointed out that it is a significant fact that the experience of European nations with health insurance has shown governmental systems to be the only systems which accomplish the purposes desired In European countries in which private health insurance plans existed, or in which there were private systems subsidized by governments, the experience has been that discouragingly small enrolments in membership resulted and that the workers who were on the border line of poverty and in the greatest need of insurance were the very ones who did not insure Great Britain, when it adopted a system of health insurance in 1911, did not subsidize private plans, as some of the European nations had done, but advanced at one step to a highly developed form of a governmental system Several other nations which subsidized private insurance plans have rejected that method and adopted a governmental system Governmental health insurance systems have unquestionably come to be recognized as the most satisfactory method of dealing with the problem of sickness among wage earners

SICKNESS SURVEY OF ROCHESTER, N Y

In studying any system of health insurance in this country, the lack of morbidity statistics has been a great drawback in calculations of the ratio of expense and the probable occurrence of disease No country, however, has had morbidity statistics until compulsory health insurance was put in force There have been two studies in New York State recently which show, in certain localities, the occurrence of sickness and, in one instance, the possibilities of existing institutions to provide adequate care for the sick both in their homes and in hospitals The Metropolitan Life Insurance Company made one of these investigations[16] in the city of Rochester during the week of Sept. 13, 1915, 7,638 families were reached, including 34,490 persons This was 14 per cent of the total population of Rochester and was considered a sufficiently large sample to give a fair degree of accuracy in judging the measure of the amount of sickness in the industrial community as a whole It is stated that an analysis of such items as occupation and the general characteristics of the families as to size confirm this conclusion

Of the 789 cases of sickness found, 82 8 per cent were unable to work, 8 8 per cent were able to work though sick, and the ability to work was not specified in 8 4 per cent It is further interesting to note that there were 356 men sick and 442 women Of the men, 83 4 per cent were sick and unable to work and, of the women, 82 4 per cent Of these, 24 7 per cent of the men were sick in bed and 29 9 per cent of the women, and of these, 13.2 per cent of the men and 19 9 per cent of the women were at home There were up and about, though sick, 58 7 per cent of the men and 52 5 per cent of the women, sick but able to work, 9 per cent of the men and 8 6 per cent of the women Taking adults of 15 years and older, it was further found that the rate of sickness and inability was 27 3 per thousand for males and 31.2 for females, including all sicknesses For sickness involving incapacity for work, the rates for ages of 15 and over were 23.2 per thousand for males and 25 7 per thousand for females Broadly speaking, over 2 5 per cent. of the working population canvassed were sick and unable to work at the time of the survey The rates of sickness among females incurring disability were distinctly higher than for males up to the age of 54, from 55 onward the rate of sickness in males exceeds that of females This is especially marked at the age period between 25 to 34, when twenty-five cases of childbirth and its complications increased the rate This rate, even with an allowance for puerperal conditions, is in excess of that for males at the same age period

The chief causes of disability were seventy-three cases of rheumatism, and tuberculosis, cerebral hemorrhage and insanity, in the order named The transmissible diseases, such as typhoid and acute infectious diseases of children, were relatively few, there being but four cases of the former and sixteen of the latter

Of the 661 persons unable to work, eight were incapacitated for one day, forty-one, or 6 per cent, for less than one week, and 149, or 22 5 per cent, for less than one month On the other hand, persons able to work show a smaller proportion of cases under one month in duration. Rheumatism, neuralgia, neuritis, neurasthenia and headache, which constitute the bulk of the cases sick and unable to work, were in most instances longer than one month in duration and influence the figures of the entire group, a large percentage of the cases being of longer duration, 128, or 19 4 per cent, lasting between one and three years

Without distinction of the extent of disability, in 61 per cent of the cases of sickness the patients had a physician in attendance, 50 per cent of the total sick outside of institutions were in the care of physicians, but only 45 3 per cent. of those sick but able to work were thus cared for, 63.8 per cent of the sick persons incapacitated for work employed physicians or were being treated in institutions There was but slight variation for sex in these figures

The sickness rates of this survey are minimal The survey was made in a month which, for Rochester, has less mortality than the average month for the year The figures, therefore, are conservative, and on the basis of the foregoing sickness rate, it may be concluded that throughout the year there are at least 2,147 males constantly sick and 2,400 females In adults of 15 years of age and over, the male population of Rochester is calculated at 92,552, and of women, 93,392

Small as these statistics are, they present practically the same percentage of sickness in relation to sex and age as do the statistics of the Leipzig Society and the Sickness Insurance Funds of Austria

SICKNESS SURVEY OF DUTCHESS COUNTY, N Y

Of special interest in connection with health insurance is a study of sickness in Dutchess County, in New York, made by the State Charities Aid Association This study was an attempt to secure reliable data in regard to sickness which had occurred in certain selected communities in Dutchess County during a sixteen month period in 1912 and the first four months of 1913 It was made at the request of the trustees of the Thomas Thompson Trust. The report says

> "It was important to have more exact knowledge of the sickness which had occurred in the county, in order to draw trustworthy conclusions as to how adequately or inadequately the existing public and private facilities were meeting the needs of the community With the exception of certain contagious diseases, reported incompletely, at best, to the health officers, there are no public records of sickness in Dutchess County—a condition true of the rest of the country as well The method usually employed of estimating the amount of sickness is to assume a certain sickness rate for each disease, based on the recorded death rate for that disease This method is arbitrary and, of course, fails to throw any light on the kind of care the patients received or on the conditions surrounding or contributing to their sickness
>
> "It was planned in this investigation to secure, directly from the families in which it had occurred, as full and accurate data as possible concerning sickness, including the medical and nursing service obtained, its efficiency and cost, the need of and the demand for domestic assistance in the homes where sickness existed, and the efficiency with which the demand was met It was believed that data might thus be obtained which, when analyzed, would point to improvements in the methods of caring for the sick and of

preventing disease. The attending physician was consulted either personally or by letter about each recorded case of sickness."

It was not always possible to obtain accurate data even with the best of cooperation among the people and physicians. In the field which was selected in Dutchess County it must be taken into consideration that the line of hills runs north and south, dividing the eastern and western sections, so that communication between them is difficult. The section to the west of the hill, toward the Hudson River, on which the town of Poughkeepsie is situated, contains 88 per cent. of the population of the county, and this section was chosen for the field of inquiry. The towns of Rhinebeck, Milan, Stanford and Clinton are typical rural communities with a total population of 7,223. Stanford is a country town of about 1,520, of whom 700 live in two adjoining villages and the remaining population is scattered around the dairy farms throughout the hills. Stanford has one resident physician.

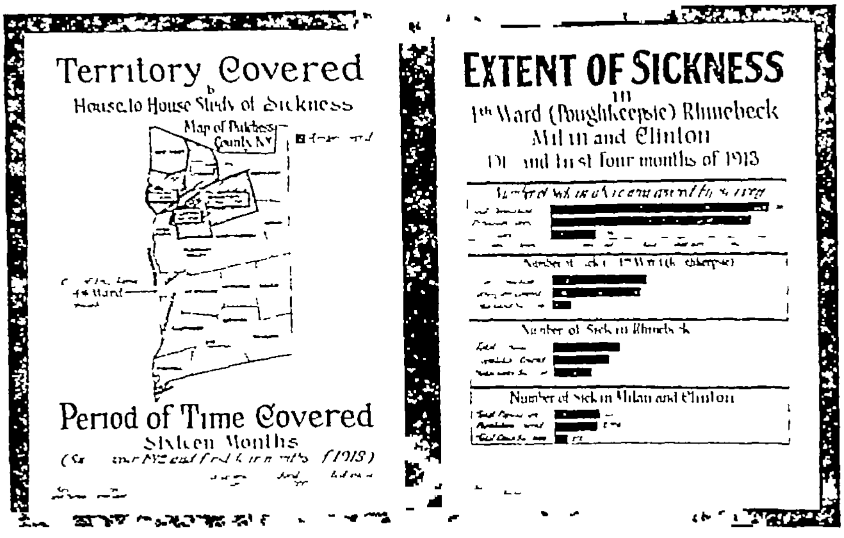

Chart 1.—Details of sickness survey.

The towns of Milan and Clinton are typical farming sections. Milan has a population of 893 and Clinton of 1,278. In none of these towns is there district or school nursing. The water supply of these towns is drawn from private wells. A relatively small number of houses are connected with cesspools, and the others still have only surface drainage with the old fashioned privy with a dug vault.

The same may be said of Rhinebeck Town, and an epidemic in the village furnished seventeen out of twenty-nine cases of typhoid. The water supply in this town is from wells and a public water supply from wells a few miles out of town.

The fourth ward of Poughkeepsie contains a population of 4,580, which is 16 per cent. of the population of the city. It contains a representative part of the main business section of the city, a wealthy residence section, and a fairly proportionate number of the homes of the poor and of those of moderate means. The ward contains an average number of the colored and foreign population of the city. Poughkeepsie has had a filtration plant connected with its water system for some years. The city's water supply is drawn from the Hudson River. Its sewage is emptied into the same river.

The term "sickness" includes only that which was so serious that it necessitated or should have necessitated the patients going to bed or securing medical aid. Slight ailments were not taken into account. By the term "adequate service" is meant that service which results in the patient's recovery when recovery can be expected, and which is of such a character that neither the patient nor the community incurs avoidable risks.

Of the 1,600 cases of sickness which occurred, 305 were men, 605 were women, and 690 were children; 506 occurred among those who were able to pay for any desired service, 882 among those able to pay for ordinary service, such as ward service in a hospital, 212 occurred among those unable to pay for any service; 920 of these obtained adequate service, 620, inadequate. In the fourth ward of Poughkeepsie, 13 per cent. of the patients were cared for in the hospitals, in Rhinebeck, 10 per cent., and in Milan and Clinton, 3 per cent. It is interesting to note that only 55 per cent. of the 1,441 patients who remained in their homes throughout their sickness were cared for adequately, 45 per cent. received inadequate care. Only 80 per cent. of the hospital patients were cared for adequately, 20 per cent. were cared for inadequately, mainly because the patients returned to their homes before their homes were ready for them, so that proper convalescence was impossible; the care while in the hospital was adequate. Combining home and hospital care, 57.5 per cent. of the recorded patients were cared for adequately, and 42.5 per cent. inadequately.

	Total	41,244	100

Chart 2.—Details of sickness survey.

It has been said that the very rich or the very poor are well cared for in the big cities, and those possessing moderate means find inadequate accommodation during illness. It is interesting to note that of the 506 patients of this study who could have paid for any necessary service, 81 per cent. were cared for adequately and 19 per cent. inadequately. Of the 882 patients of moderate means who could not have stood any prolonged drain on their income, 50.5 per cent. received adequate care and 49.5 per cent. inadequate. Of 212 patients who could not pay for any medical or nursing service, 32 per cent. received adequate care and 68 per cent. inadequate. It is also to be noted that of the 680 cases out of the total number of 1,600 recorded who were inadequately cared for, 21.3 per cent. occurred among those who were unable to pay for any care, 14.4 per cent. were among those who were able to pay for any necessary service, while 64.3 per cent. were among those who could pay ordinary charges but not for any length of time. In other words, it is stated that in nearly 79 per cent. of the cases in which there was found to be lack of proper services, poverty was not a controlling cause of that lack There were in most cases no facilities for services to be had, and in other cases there was a lack of proper knowledge of what service to seek for and how to seek for it

Four hundred and forty two patients, that is, 28 per cent of the 1,600, could not have been cared for adequately in their own homes Two hundred and thirty-six of these—15 per cent of the total 1,600—who suffered from noncontagious diseases, could have been cared for adequately only in hospitals because of the nature of their cases from a medical standpoint The other seventy-three patients, 4 per cent of the total, who suffered from contagious diseases, needed hospital care for the same reason One thousand, one hundred and fifty-eight, or 72 per cent of the total, could have been cared for adequately in their homes Of these, 1,128, or 97 per cent, required efficient medical care, while the condition of thirty patients, 3 per cent, was such that extra medical care or nursing was necessary One hundred and sixty-five patients should have been cared for by a trained nurse Of these, thirty-three required resident service and 132 visiting service In 115 instances, the services of an untrained nurse or attendant were necessary In 131 homes the adequate care of the patient implied the employment of a resident domestic helper, and in fifteen homes the services of a domestic helper on part time Twelve per cent of the resident service involved should have been trained, and 88 per cent untrained attendants or domestic helpers Of the visiting service essential, 86 per cent should have been trained, and 14 per cent could have been untrained

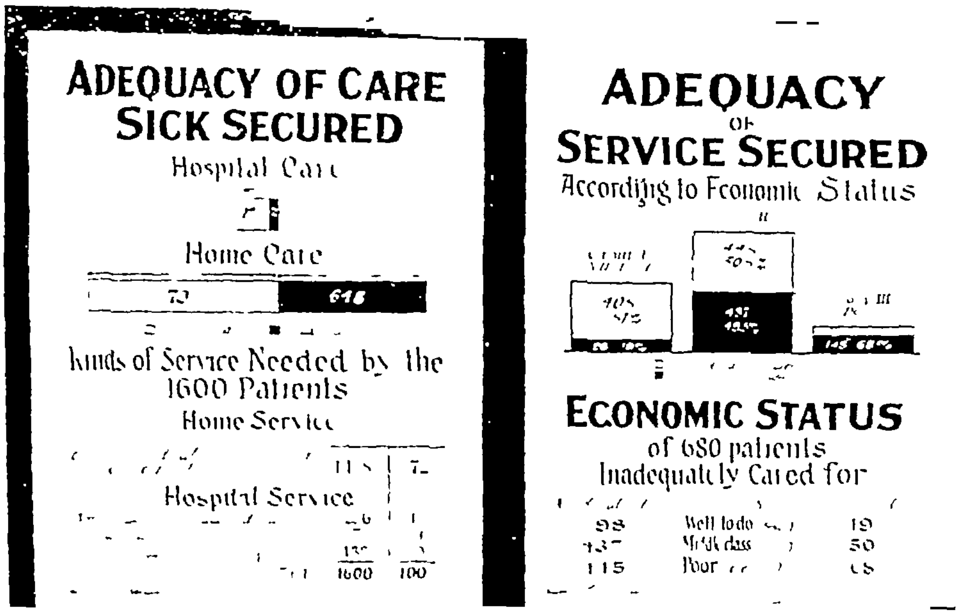

Chart 3 —Details of sickness survey

The importance of the findings of the house to house canvass of selected districts of Dutchess County lies in the fact that there is every reason to believe that the amount of inadequately cared for sickness discovered is typical of what one may expect to find in many other communities through the state and nation Here is a small group made up of a small city and several country communities in normal times—no unusual epidemics, no extraordinary social or industrial conditions—during a period shown by reported deaths, reported cases of contagious disease, and the unanimous testimony of physicians to have been a light year for sickness The accompanying charts give these facts graphically, and the situation in Dutchess County can be well considered as typical for the average condition of affairs outside of big cities Among those of moderate incomes, the majority of whom probably would come under health insurance, the chances are even whether or not a person at present receives adequate care for sickness Among the poor the chances are two to one against their receiving proper care It is a noticeable feature that 24 per cent, or practically one fourth of the 1,600 patients here sick, received no medical care whatever

Chart 4 —Findings and suggested organization

In general, after enumerating all the agencies now acting in the county, it is found that in most instances these agencies are doing their work well in their separate fields Organization, however, is needed to bring about cooperation on the part of existing agencies, provide for facilities that are now lacking and stimulate the provision of such new means for the care of the sick and the prevention of disease as may be found desirable A county health association is therefore recommended as the form of organization which is desirable This might at first be a private organization and might remain such permanently, although many of its activities from time to time might be taken over by public agencies, which is not an unusual line of development It is further recommended that the proposed organization should cover the entire county, but to begin with it would be more feasible to organize these facilities in one or two of the districts in such a way as to admit of gradual growth and extent of the organization throughout the county without radical change The report states that "the health association would have as its objects the coordination and development of existing facilities of the community for the care of the sick and the prevention of disease, in order to make them thoroughly efficient and readily available to all, and the development of such additional facilities as study and experience may indicate are needed The association, however, cannot attain these objects unless it has the sympathetic interest and cooperation of the physicians of the county Their interest and cooperation must underlie all its work and are vitally essential to its success

In order to do its work most efficiently, the association should cooperate with all the public and private medical and social service agencies at work in the county, as follows

A *Remedial Work*—1 Establishing an efficient system of medical, nursing and social service for the care of the sick in their own homes

2 Securing the cooperation of the existing hospitals Stimulating the provision of additional facilities where and when clearly needed

3 Maintaining a proper distribution of patients as between home and hospital care, based on a study both of the patient s disease and of his social and economic circumstances

B *Preventive Work*—1 Educating the individual (*a*) as to personal hygiene and the observation of its laws, (*b*) as to the nature of communicable diseases and the means of avoiding them as well as the necessity of collective action to safeguard health and avert danger from these sources, and (*c*) as to the bad housing and unfit social and industrial conditions in which he lives and the means that can be employed to improve those conditions

2 Securing the adoption and strict enforcement of public health measures, i e., public hygiene"

Further details of this interesting investigation must be obtained from the report itself, as space does not permit further discussion This work is best explained in the graphic charts

Proposed Health Insurance Act

For the past year a committee of the American Association for Labor Legislation has been working to obtain a definite measure to prevent as embodying certain health insurance standards that could be modified to meet the situation in the various states of the Union The following health insurance standards have been adopted, and the following tentative draft of a health insurance act has been agreed upon as a standard act which could be modified as the exigencies of the various states required It is noticeable that in this draft of a bill the medical and surgical requirements are not fully formulated This has been intentional because it was deemed necessary that the physicians of any state should be required to consult with the authorities in formulating the regulations under which they are to work.

Following are the health insurance standards and the draft of a health insurance act

HEALTH INSURANCE STANDARDS

1 To be effective health insurance should be compulsory on the basis of joint contributions of employer, employee and the state

2 The compulsory insurance should include all wage workers earning less than a given annual sum where employed with sufficient regularity to make it practicable to compute and collect assessments Casual and home workers should as far as practicable be included within the plan and scope of a compulsory system.

3 There should be a voluntary supplementary system for groups of persons (wage workers or others) who for practical reasons are kept out of the compulsory system

4 Health insurance should provide for a specified period only provisionally set at twenty six weeks (one half year) but a system of invalidity insurance should be combined with health insurance so that all disability due to disease will be taken care of in one law, although the funds should be separate.

5 Health insurance on the compulsory plan should be carried by mutual local funds, jointly managed by employers and employees under public supervision In large cities such locals may be organized by trades with a federated bureau for the medical relief Establishment funds and existing mutual sick funds may be permitted to carry the insurance where their existence does not injure the local funds but they must be under strict government supervision

6 Invalidity insurance should be carried by funds covering a larger geographical area comprising the districts of a number of local health insurance funds The administration of the invalidity fund should be intimately associated with that of the local health funds and on a representative basis

7 Both health and invalidity insurance should include medical service, supplies necessary nursing and hospital care. Such provision should be thoroughly adequate, but its organization may be left to the local societies under strict governmental control

8 Cash benefits should be provided by both invalidity and health insurance for the insured or his dependents during such disability

9 It is highly desirable that prevention be emphasized so that the introduction of a compulsory health and invalidity insurance system shall lead to a campaign of health conservation similar to the safety movement resulting from workmen s compensation.

HEALTH INSURANCE TENTATIVE DRAFT OF AN ACT

Section 1 Title.—This chapter shall be known as the Health Insurance Act.

Section 2 Definitions—When used in this act

Commission means the Social Insurance Commission.

'Fund means a local or trade fund as the case may be.

' Society means an approved society

'Carrier" means the society or fund which carries the insurance

Insurance" means health insurance under this act

Disability" means inability to pursue the usual gainful occupation

Section 3 Compulsory Insurance.—Every person employed in the state at manual labor under any form of wage contract, unless exempted under Section 4 of this act, and every other employee whose remuneration does not exceed $100 a month, shall be insured in a fund or society, except employees of the United States and except employees of the state or of municipalities for whom provision in time of sickness is already made through legally authorized means which in the opinion of the Commission are satisfactory

Section 4 Home Workers and Casual Employees—Special regulations shall be made by the Social Insurance Commission for the insurance of home workers and casual employees, or for their exemption from compulsory insurance.

Section 5 Voluntary Insurance—Self employed persons whose earnings do not exceed $100 a month on an average, persons formerly compulsorily insured who, within one year from the date on which they cease to be insured apply for voluntary insurance members of the family of the employer who work in his establishment without wages may insure themselves voluntarily in the local or trade funds of the locality in which they live and of the trade at which they are employed, subject to conditions of this act

Section 6 Cases In Which Paid—Insured members shall receive benefits in case of any sickness or accident or for death, not covered by workmen s compensation

Section 7 Minimum Benefits—Every carrier must provide for its insured members as minimum benefits Medical surgical and nursing attendance medicines and surgical supplies cash benefits maternity benefits funeral benefits medical and surgical attendance and medicines for dependent members of their families

Section 8 Beginning of Right—Insurance with the exception of maternity benefits begins with the day of membership The maternity benefits shall be payable to any woman insured against sickness for at least six months during the year preceding the confinement, or to the wife or widow of any man so insured

Chart 5—Constructive measures suggested by State Charities Aid Association

Section 9 Medical Surgical and Nursing Attendance.—All necessary medical surgical and nursing attendance and treatment shall be furnished by the carrier from the first day of sickness during the continuance of sickness but not to exceed twenty six weeks of disability in any consecutive twelve months In case the carrier is unable to furnish the benefit provided for in this section it must pay the cost of such service actually rendered by competent persons at a rate approved by the Commission.

Section 10 Medical Service.—The carriers, subject to the approval of the Commission shall make arrangements for medical surgical and nursing aid by legally qualified physicians and surgeons and by nurses or through institutions or associations of physicians surgeons and nurses Provision for medical aid shall be made by the carriers by means of either

1 A panel of physicians to which all legally qualified physicians shall have the right to belong and from among whom the patients shall have free choice of physician subject to the physician s right to refuse patients on grounds specified in regulations made under this act provided however that no physician on the panel shall have on his list of insured patients more than 500 insured families or more than 1 000 insured individuals.

2 Salaried physicians in the employ of the carriers among which physicians the insured persons shall have reasonable free choice

3 District medical officers, engaged for the treatment of insured persons in prescribed areas.

4 Combination of above methods.

Section 11 Medical Officers—Each carrier shall employ medical officers to examine patients who claim cash benefit, to provide a certificate of disability and to supervise the character of the medical service in the interests of insured patients, physicians and carriers

Section 12 Medical and Surgical Supplies—Insured persons shall be supplied with all necessary medicines surgical supplies dressings eyeglasses trusses crutches and similar appliances prescribed by the physician, not to exceed $50 in cost in any one year

Section 13 Hospital Treatment for One Perso —Hospital or sanatorium treatment and maintenance shall be furnished upon the narianism The physicians on their part have a right to demand a fair remuneration for services given and must agree to give willing and adequate medical service On the other hand, they must submit to strict control by the profession of dishonest or delinquent members or they must submit to lay control for the punishment of such members Physicians in any given state may demand that certain fundamental principles regarding medical service shall be incorporated in the law itself This has the advantage of being more difficult to change than regulations, and for certain broad general principles it may well seem to be advisable

Following the example of the profession in England, the physicians will, without doubt, in this country demand that they have adequate representation on the various controlling bodies administering the law This will probably be true for the representation on the insurance commission itself and then on down through the various arbitration and executive committees to their own committees composed only of panel physicians or physicians actually doing the insurance work among the workingmen After the adequate representation specified in the law, it would seem wisest to leave further regulation of the medical work to be done under the Health Insurance Act, not to the hard and fast designation of the law itself, which must be changed only through legislative action, but to the medical regulations under the Commission, which would, therefore, be more flexible and could be changed easily by executive act Thus the law could be made to run more smoothly because more easily changed, if it were found at any time to be bearing unjustly in the carrying out of its medical functions It would seem wise to leave these regulations to a body composed in part of the representatives of carriers and of workmen of each district and representatives of the physicians elected by doctors working in the insurance district under the chairmanship of a member of the State Controlling Commission or a judge Thus all interests—the employers, the employees, the state, and the physicians—would be represented in the discussion and formulation of these regulations and the desired working equilibrium of exact justice to all interests would be obtained

It has been found necessary in all countries abroad to have committees of physicians who do the insurance work, who meet regularly and who have the power of scrutiny over the economy or extravagance in the ordering of drugs, and who have some degree of power for the discipline of physicians in minor matters and who hear and decide disputes among the physicians themselves Complaints between the physicians and the societies, or between the physicians and the carriers, or between physicians and workingmen go to other committees composed both of the workingmen and the physicians In England, particularly, there are committees representing all the physicians, whether on a panel or not, in a given neighborhood There are also, as has been pointed out, other committees to which disputes go on appeal These committees are either regularly instituted, as in Germany, and are permanent, or they may be formed as inquiry committees for the time being, as in England, to consider certain definite disputes or definite questions in dispute laid before them for referee decision under the Commission The German method of appointment of committees is the simpler and more direct, that of the English law being much more complicated and demanding more detail in its regulations

In both countries there are the registered chemists or pharmacists, and in neither country are the physicians allowed to dispense medicines except in England, in sparsely settled districts under certain definite rules Again are disputes between pharmacists and the physicians regulated by committees, and regulations permitting appeals up to the Commission are formulated All this intricate mechanism is necessary to bring about the smooth running of an intricate law

One of the questions most persistently fought for by the profession in Germany, and one point which was won by the profession in England, is that of free choice of the physician by the patient This, of course, must be within the limitations of consent by the physician to have the patient, and with the physician chosen especially within a reasonable distance of the patient, that he may give good service Against this free choice one party in Germany, as represented by the Dresden Society, has insisted on having any given area divided into districts and a salaried physician placed in each district All insured persons are expected to consult the doctor in their district, but in case of dissatisfaction their wishes are consulted as far as possible All appointed doctors are free to engage and do engage in private practice

Still another method sometimes advocated is that practically of a state medical service, with salaried physicians, in which all persons in a certain district are given the medical attention of certain specified physicians, or, of course, there may be free choice of physicians among a certain limited number of district doctors This state service has best been exemplified in late years in the medical service rendered in the Panama Canal Zone It was here shown how brilliantly and successfully such a generalized system of state medicine could be carried out in certain areas

Left to the profession to decide, it is probable that free choice of physician, without limitation, will be chosen in the majority of instances There is no question that the human relation between physicians and patient will be demanded and should be granted, even under health insurance laws or under state medicine where possible This is particularly advisable where the care of families is in question, for justice demands that whatever may occur to the children of a family it should be the privilege of the parents to feel that they have had the physician of their choice and that no matter how unfortunate the outcome of any sickness may be they have done all that was possible for them to do and have blocked up all loopholes for regrets

Even with the free choice of physicians there must be regulated the limit of the panel or the limit of the number that any one physician may enroll to whom he is willing to render service It is a curious feature in the working of the English law that two years after the act had been in operation the Fabian Committee reported that one fifth of the physicians were caring for one half the patients and four fifths of the physicians for the other half of the patients Thus there was the evidence of overcrowded panels and hurried and inadequate service, which is, as has already been said, the curse of the capitation system of payments and of lodge practice There must, therefore, be the limitation of the number of patients or families that a physician can care for Considering that in all probability each patient will be sick ten days in a year, one can calculate the probable number of patients that could be visited daily For instance, if a thousand patients, or 500 families, with three to a family, that is, 1,500 patients, were permitted to each physician, he would have from 10,000 to 15,000 sick days a year to care for That would be from twenty-eight to forty-two patients a day of minor and major ailments This will be recognized as being all that can be conscientiously well cared for It might be claimed that with one or two assistants a man might well care for more patients but the question of assistants brings up the question of the lack of personal care that the physician gives, or does not give, to the patients he has contracted to serve, and probably it would be wiser that no assistants who are not on the panels should be allowed Two or more panel physicians entering into partnership, and who were willing to pool their panels and render services of mutual aid to each other, would certainly not be objectionable

REMUNERATION OF PHYSICIANS

In considering the remuneration of physicians under health insurance it is necessary to consider certain medical customs and habits of thought The medical service is always an individual one, and the state requires it to be individual Medical public opinion demands that the physician shall give an adequate and just service to his patient, and that the physician shall not permit himself to be placed in positions where he gives careless, incompetent service, to the injury of those under his care Any physician neglecting this standard loses caste He is condemned by his colleagues, and the position or system in which such service is likely to occur is held in contempt by the profession, and has been classified under the opprobrious name of "contract practice" All medical service is really a contract, and many physicians under salaries, such as with insurance companies or railroads, are not condemned, nor do they lose caste, by accepting such contracts. But any contract which carries with it an unreasonable amount of work by the doctor, which in turn forces neglectful, hurried service to the patients, is always condemned. These situations are usually found in certain lumbering and mining camps and under other corporations, and in the familiar lodge practice in large cities.

Lodge practice and other condemned forms of contract practice are all under the capitation plan of remuneration, and the capitation idea of service under sickness insurance has necessarily these inherent faults, which cannot be eradicated and can be controlled only to a limited extent if they can be controlled at all. By this form of capitation is meant the per patient per year form of payment to the doctor. Another form of capitation which is used abroad is frequently used in a compromise with the free choice system of the doctor by the patient, that is, a sickness society has a certain amount of funds that it can pay for medical services to the doctors. This lump sum it gives to some association of doctors, and the physicians charge up each visit and each act of service rendered to each patient as so many points of work done against the medical society. Usually every three months each physician hands in his account to the medical society, and the total number of points are divided into the total amount of funds, and the remuneration paid to the physicians pro rata. The two faults in this country for this method are, that there is no society or association of physicians which is sufficiently universal in its membership to justify such a procedure, for many men who would work among the working classes do not belong to the medical societies and if any control was attempted through the present societies, there would be many doctors working among the insured who would be beyond such control, and, furthermore, in times of great amount of sickness, the more work done the less is each point of service worth, and after a certain amount of service has been given by the physicians, the more work they do, the less money do they receive in ratio to work done. If the total amount paid by the societies remained the same, and if twice as much work were done by the doctors in an epidemic as in an average year, each point would be worth half as much and the remuneration would be the same under great stress of work as under an average year. This is not just remuneration, and would soon bring a resentment on the part of physicians because of undervaluation of their work and the injustice in it, and there soon would develop a situation similar to the other form of capitation of overcrowded work and the underpaid men.

There is, in some parts of Germany, the regularly paid physician under definite salary from the society. This might or might not work out well because it would be a similar form of contract to that of the railroad surgeons but it would be very liable in sickness insurance to be abused, and soon the inherent faults as in capitation, would develop. Moreover, any sickness insurance society could hire only a certain number of physicians and unless they arbitrarily refused free choice of physicians to their members and divided them in equal numbers among their salaried physicians the natural difference in personality of the physicians would immediately cause the practice of some to be overcrowded while that of others would be neglected, and again the inherent faults under capitation would develop.

One comes to the other form of medical service—that of visitation that is a stated fee per visit per patient or with a fee graded according to character of services, with free choice of the physician by the insured either with an unlimited number of patients or with a limited number of patients under a panel system by which a definite number of patients can be apportioned to any one doctor and under which all patients must be apportioned to some doctor—this with the consent of the physicians and patients or, absolute free choice of the physician by the patient, with no panel and no control by the commission of the physician through his position on the panel, or free choice of the physician by the patient, with control of the physicians through a series of committees.

It has been generally claimed that free choice of physicians and this visitation method of so much per patient per visit always increases the number of visits and the expense of medical care to the insuring societies. These claims, however, were not substantiated in an investigation of the subject in Manchester, England. There is no question that from the medical point of view the visitation system is the most just. There is no question from the patient's point of view that they obtain by this means the best service. There is less danger of neglectful and overcrowded services being rendered to them, it eliminates the inherent faults of the capitation system but increases the expense over capitation because it gives a fair return, which capitation does not do. It seems to increase the opportunity for malingering and simulation, which, unless controlled, become the bane and ruin of any social insurance system.

The ethics of any profession are but the moral customs of the general community modified to suit the peculiar services which that given profession performs, and the ethics of the average member of any profession will not rise any higher than the average of the community in which he lives. In any community, therefore, there will be dishonest physicians, whose acts must be controlled that they may render an honest return to the patients and to the insurance carriers. Therefore, this human factor necessitates a scheme by which this control can be most economically and efficiently exerted.

WHO SHALL DECIDE WHEN A PATIENT HAS RECOVERED

In all sickness insurance, there is one mooted question that constantly arises, and that is, who shall decide any dispute between a physician and an insured member as to whether or not this patient should go back to work and his benefits cease? There is always trouble if this work is left to the panel physician alone. Patients will demand leniency, will go to the doctors who are lenient, and physicians, unless of rugged character, will be afraid of losing their patients and injuring their income unless they are lenient, and thus the expense of the insurance carriers will be enormously increased by a continuance on the sick list of patients who should be at work. If, whenever this mooted point arises, the decision could be referred to some impersonal committee or to some regularly constituted salaried medical referee, it would enormously improve the working of the insurance act. There will probably be required a medical inspection department under a medical referee or referees to control malingering and valetudinarianism.

In considering this matter of dispute between the insured and the physician as to whether or not the patient is fit to work, some figures in the experience of the Leipzig and Koningsberg societies are of interest. In the Leipzig society, in 1910 there were 8,497 requests made that the confidential medical advisers of the society should ascertain whether or not the patients genuinely were unable to work. Of these 3 382 were made by the treating physicians and 5,115 by officers of the society. Those who did not come up for examination but went to work of their own choice, numbered 2,670. Of the 5,827 examinations made, 47 per cent. of the patients were declared able to work forthwith, 12 per cent. were declared able to work at the end of the week, 10 per cent. were put off to be reexamined at the end of one or two weeks, and 31 per cent were declared unable to work.[17] In theKöningsberg society in 1909-1910 there were 4,937 who were examined by the confidential medical adviser. Of these, 2 527 were examined at the request of the society, 344 at the request of the attending physician and fifty-seven at the request of the patients who considered that they had been wrongly certified as able to work. Of these, 33 per cent were certified as able to work forthwith, 21 per cent. as able to work in from three to eight days, 23 per cent. as unable to work, and 18 per cent went to work immediately and did not come up for examination.

The testimony concerning the medical referees taken before the Departmental Committee on Sickness Benefit Claims in England strongly favored referees paid by the central commission, not by the approved societies or the insurance committees under the commission. That is, referees were desired who represented the central body. There was a division of opinion whether these should be full-time referees or half-time referees. It has been said, and probably not unjustly, that if half-time referees were employed there would be a greater number of referees and probably a better class of physicians could be obtained than if full-time referees were employed

---

[17] Gibbon Medical Benefits in Germany and Denmark.

It was further brought out that it would perhaps be possible to have members of the panel committee act as referees to decide cases that were not in their districts and among patients who could not possibly become their patients, so that in any given group of panel physicians there would be an interchange of the work of refereeing This would have the advantage that the work would be done by men who would best appreciate all the necessary points of view which the special work demanded On the other hand, this method of reciprocal refereeing would have the disadvantage that it would lack the element of medical inspection on the part of the commission, which referees working under and paid by the commission would possess At first glance the addition of the expense of the medical referees to any insurance scheme would seem to add greatly to the expense of the medical administration, but the existence of the referees would save in sick benefits more than enough to pay for their salaries, besides, the salaries of the referees should not be charged to medical expense They should be looked on from the administration point of view and charged to administration expenses, for they are necessary for efficiency and effectiveness in the administration of the law and are representatives of the executive department and should be so considered

THE SPECIALIST IN HEALTH INSURANCE PRACTICE

From the patient's point of view, efficient medical service is necessary Any general sickness insurance law among the poor will develop an increase of medical service and demands Some form of sickness or injury has been the calamity through which the poverty of the poor has been changed to destitution in the majority of those applying to charity for aid, so that often all that has separated poverty from destitution has been the ability of the wage earner to go to work each day Just so soon as the wage earners realize that they can have medical care as their due, without further expense than already borne by them, it is bound to increase enormously the demands on the medical profession Of course, after a few years, when they become used to the idea, the mass of trivial and unnecessary calls will diminish, but a certain amount of unsuspected sickness among the poor will come to light and will probably increase the necessities of medical care beyond any calculated expectations Adequate medical services to the patient must contain, at times, the possibilities of more than the average practitioner can necessarily furnish The standard demanded from the individual practitioner will probably not exceed that demanded under the English act, which considers that adequate medical attention and treatment is that treatment of a kind which can consistently, with the best interests of the patient, be properly undertaken by a general practitioner of ordinary professional competence and skill The physicians of the Book Printers' Sickness Fund, of Berlin, agree to care for all members not requiring hospital treatment, and to expedite recovery to the best of their power In the Leipzig Sickness Fund, physicians agree to give requisite treatment in accordance with the recognized custom of the medical profession The English act does no more than provide the advice of the panel doctor as to how further treatment may be obtained It fails noticeably to furnish expert care or advice or adequate hospital accommodations, it only attempts to provide this in tuberculosis

In the sickness societies of Germany there are many specialists to whom the patients may go The Leipzig society employed 130 specialists and twenty-four dental surgeons out of its total of 400 doctors, the Dresden society sixty-four out of its total of 226 The ratio of specialists to general practitioners should be at least one to five These necessary details of organization must be left to the arrangement of the local societies There is no doubt, however, but that the details of what is ordinary and what is extra work, such as the difference between day calls and night calls, the difference between office visits and home visits, the detail of the ability of the general practitioner to call in a consultant if he or the patient shall demand it, what shall be the fees under these circumstances, or whether all consultation work shall be done by the medical referees, are all questions coming up for decision

There is no question that modern medical treatment demands more team work among physicians than was formerly done The bacteriologic examinations of sputum, of throat cultures, etc, are done in this country free of charge by the city and state departments of health But Roentgen-ray diagnoses and any other special diagnostic procedures must still come under the specialist category

HOSPITALS AND DISPENSARIES UNDER A HEALTH INSURANCE LAW

This brings us to the question of the dispensaries, and back of the dispensaries, the hospitals Up to this time the dispensaries and the hospitals have been the expression of the amount of free medical care that the city or state governments, or private corporations, were willing to give to the poor A well-conducted and well-organized dispensary offers the most economical and efficient method of giving to the patient the many specialized medical services that the varying nature of their illnesses may require More diversified medical and surgical work is performed in the dispensary than is performed in the hospitals There is less specialized service in the majority of the hospitals than in any dispensary of even moderate size But there are more hospitals given over to special work than there are dispensaries so constituted, although most special hospitals have also a dispensary attached to them for the sake of obtaining patients to fill the hospitals Most of the medical positions in dispensary or hospital are occupied without remuneration, the medical experience being sufficient compensation in this country for whatever time or knowledge the doctor may bestow Abroad, in certain countries, similar positions have a salary attached to them, and medical men are not expected to give their medical or surgical knowledge and services uncompensated

Under the sickness insurance law, the general dispensaries present opportunities for an adequate and well-developed method of furnishing abundant services in special branches of medical or surgical care to all patients who are not too sick for hospital care and who may require some special service which the average general practitioner cannot give them The situation, however, will arise whether or not the dispensaries should be confined to the use of the development of the specialties and all the general medical care given in the homes of the patients, or whether patients shall be allowed to choose between their own doctor and some general practitioner in the dispensary as far as the general medical care is concerned This is a question which contains serious possibility of dispute It may be that the general medical classes of a dispensary may, in the end, be developed into a place where patients may go for expert diagnosis on the plane of the consultant, being referred back to their physician for care or being referred to specialists, if such be necessary, the dispensary becoming then an institution for special care or expert diagnosis and not containing, as now, classes in ordinary internal medicine However this may be decided, medical services rendered in the dispensary must, in future, receive remuneration, and free dispensaries soon be a thing of the past Physicians in the dispensaries, moreover, must be under control of the committees controlling the doctors in general insurance practice, and if the dispensaries are run by private corporations, it must be within the power of the Commission to forbid persons under the insurance act to go to dispensaries which do not give adequate medical service In all probability, if the Commission should publish to the insured that a certain dispensary was failing to give adequate medical care, the stigma of such publication would soon force any private corporation to give adequate medical services The rules and regulations by which patients are permitted to accept the hospital provision of the sickness insurance act will have to be under definite agreement and the care received in the hospitals under definite supervision

Under the workmen's compensation law, disputes arise because in the same ward one patient will be under the compensation law and another not, and any surgeon is liable to be accused by the patient not under the compensation law of neglecting him and favoring the man under the compensation, because of the extra fee given to the surgeon The workmen's compensation law makes certain poor patients pay patients and necessarily leaves others out of this category Sickness insurance laws will probably act in the same way in the medical wards in the same hospitals, and the human element of envy and resentment on the part of the patients will bring many disputes and complaints of the service rendered to them It is doubtful if the attending physicians and surgeons in the large public hospitals should take positions on insurance panels It would seem wiser if they did not They usually have reached a position in their profession where their private practice is not among those persons who will be insured by the sickness insurance act It would seem wiser, therefore, that it should become a custom that the attending physicans, at least, should care for all alike without remuneration, and that the special work required by the sickness insurance should be done by some assistant and not by the attending physician The attending physician, therefore in charge would give his services to all alike, and there could be no criticism or envy on the part of the patient for care received The decision required by the sickness insurance act as to when the patient was ready to leave the hospital and go to work, of filling out the certificate necessary under the working of the act, the special daily hospital care and attention required, should be done by some assistant against whom the question of unequal attention between patients could not arise. Adequate supervision of smaller hospitals in which there is no house staff must be formulated by the Commission for there is no question, as stated above, that adequate medical and surgical service must be given and must be controlled, whether this service be in the homes of the patients or in the hospitals and dispensaries to which they may go

We have considered here the working and necessities of medical care and control under a compulsory sickness insurance as exemplified chiefly in England and Germany, as these two types of compulsory insurance give the best examples of the results of the various methods employed for the carrying out of compulsory sickness insurance. Many difficulties of administration and many failures in administration have developed in both countries through the employment of the capitation plan of remuneration to the physicians In Germany this has resulted in bitter animosity between the medical profession and the insuring societies, and bitter contests for increased remuneration in which, in the enormous majority of contests, the physicians have won In England it has resulted in inadequate care being given to the majority of the insured under the act In this country it would seem to be useless to attempt to repeat the inherent faults of capitation payment, and medical opinion and customs in this country are already in vigorous antagonism to this form of contract practice It would seem unwise therefore, to start with the bitter antagonism of the medical profession against capitation This would seem to force the necessity in this country of a remuneration based on the visitation system. With this point of view clearly recognized many difficulties experienced abroad will not occur, and in fact, the chief stumbling block to the successful carrying out of the law is removed.

GENERAL COMMENT

This voluminous report has made no pretense of arguing for or against health insurance. It has made no attempt to bring together the advantages or disadvantages to be gained by the community, or its desirability as a measure of health or social necessity The Committee on Social Insurance offers it as a compilation of what has been done abroad and of the present situation in the United States It has brought forward only those points which would seem to be of interest to the medical profession and which will be useful to them in preparing a study of the situation in any given state in this Union where health insurance is likely to be brought up and placed on the statute books

The effective administration of any health insurance law must be done through limitation by trade or geographic area of its application This is clearly seen in the working abroad of the various laws in the different countries The English law is difficult of administration because it violates this fact. Germany and Austria show marked effectiveness because their laws follow this peculiarity Furthermore, the results obtained in working out the details of the law will be greatly influenced by the financial management of it. In Germany the percentage of expense borne by each member—the employer, the employee, and the state—is designated in percentage, the actual amounts necessary being left to experience and management to obtain. In England a definite monetary amount was laid down by law, and with the errors of actuarial calculation, it has been found that these amounts are insufficient to give the desired results to the workers Eighteen cents a week as a premium was insufficient to give a full measure of sick benefits to the workers or just remuneration to the physicians and medical benefits to the sick, let alone the expenses for administration The English law fails to give more than the ordinary medical service and gives but a minimum of surgical apparatus and appliances, with the result that the sick do not receive the care they should, though the physician is justly remunerated, and the lack of proper appliances keeps many sick on the sick benefit funds at the unnecessary expense of the insurance carriers In Germany the generous application of medical benefit and surgical appliances brings back the tremendous saving in time and wages As was pointed out by the Judicial Council last year, the expense of $8 000 to specialists saved over $160,000 in wages and sick benefits

However one may criticize the details, the insurance act has unquestionably improved the condition of the working classes which have come under the law This is a very noticeable feature in England It will be of great interest to note in the future the effect of the great war on these countries and on the laws of social insurance

The Committee on Social Insurance has endeavored to bring forward as much detail as possible regarding the remuneration of physicians under these laws in order that the economic results on the lives of the physicians could be fairly studied

The more these laws of social insurance are studied the more it is evident how essential is the medical profession in their administration It is equally essential that the profession should clearly understand these laws, and the Committee on Social Insurance therefore, offers this study of health insurance for the assistance of the profession in obtaining this necessary information

Respectfully submitted

ALEXANDER LAMBERT, Chairman

COMMITTEE ON WOMEN'S AND CHILDREN'S WELFARE

To the Council on Health and Public Instruction

Three years ago at the beginning of my chairmanship of the Committee on Women's and Children's Welfare, we adopted the policy of developing one line of action At that time the baby health movement was of the most immediate interest, and offered, as it seemed to us the greatest possibilities among the various phases of public health work then under consideration, we therefore centered our work on it

By the end of the first year our official score card was in the hands of the public, together with Pamphlets 4, 5 and 7 Pamphlets 4 and 5 contain directions for measuring and scoring of babies plans for conducting conferences, and book lists, Pamphlet 7 is devoted to care of the baby At the close of the second year the movement had begun to swing from the contest to the conference ideal, thus establishing a more permanent and scientific basis for our work—that of development of the frail child, rather than recognition of the already healthy one. During the second year the women's clubs throughout the country began to grasp more thoroughly the possibility of the movement, and the Children's Bureau to give its active support But to show how even our committee underestimated further development we quote from a concluding paragraph of the second annual report, p 39

> "With contests giving way to conferences, with the gradual elimination of cash prizes, with the steady increase in number of permanent stations and with increased legislation establishing bureaus and child hygiene departments we feel that the baby health movement is sufficiently developed to be taken care of with ease, and to pass into a minor work of the committee."

With the women's clubs and the federal bureau thoroughly alive to the possibilities of the baby health movement, the last year has been by far the most profitable of my chairmanship In November, 1915 Miss Julia Lathrop issued a bulletin, "Baby Week Campaign," stating the purpose in the introduction, as follows

> "The accompanying bulletin, entitled 'Baby Week Campaigns,' has been prepared for the purpose of presenting in

detail such practicable methods of organizing and carrying on a Baby Week as will be of general application and utility in cities, towns and rural communities throughout the country It has been requested especially by the General Federation of Women's Clubs, which has announced its purpose to promote a nation-wide campaign for the observance of Baby Week '

In the same bulletin Miss Lathrop gives the place our work held in the week's campaign

"The following suggestions for the organization, equipment and arrangement of a baby health conference of any type held during Baby Week are adopted from methods used in many successful conferences The pamphlet of the American Medical Association on Baby Health Conferences has been of great assistance in drawing up this outline Different communities may develop modifications of detail in accordance with local conditions The Children's Bureau will be glad to receive reports of any important modifications which prove successful"

The bulletin later describes the three acceptable types of conferences, namely, "baby health conference without score card, baby health conference with score card, and baby-improvement contests"

The baby health conference without score cards is the ideal conference, and the one the federal bureau carries out

"The record sheet used in these conferences gives space for notes on the age, height, weight, previous history, and any physical defects found in a thorough physical examination It has a page on which the examining physician gives advice to the mother on the general hygiene necessary to better the physical condition of the baby or to keep the baby well In a conference of this type no attempt is made to compare the development or condition of different babies, the object of the conference is rather to center the attention of the mother on the qualities and needs of her own child, to teach in a practical way the facts with regard to the care of babies and to point out the sources of assistance in making or keeping the baby well These purposes should be made plain in the publicity material given out"

In a baby health conference with score card "the physical condition of the baby examined is recorded on a score card For each defect found a certain amount is deducted from the perfect score of 100 When the examination is finished and the score computed, the latter expresses the general physical condition and development of the child Many successful conferences have been held throughout the country during the past few years according to this method The American Medical Association has prepared a standard score card which may be obtained for use at baby health conferences This organization has also prepared a pamphlet giving instructions for organizations wishing to conduct a baby health conference according to this score card, suggestions on the use of the score card to physicians making the examinations, and suggestions upon the computation of the score"

The baby-improvement contest is another form of baby health conference "in which the babies are first examined and scored as in the above conference, and after an interval (one to twelve months) are again examined and scored, and a diploma, medal or prize is given to the babies showing the greatest improvement in score The following resolutions were adopted by the council on health and public instruction of the American Medical Association, Feb 24, 1914

> "That if the awarding of any medals or prizes seems judicious in the baby health conferences, they shall be given to the babies showing the greatest improvement in health between the various examinations rather than to the naturally healthy child who scores high at the first examination"

In compliance with these suggestions, our committee has realized the possibility of making our work in the movement yield nation-wide results The American Medical Association has supplied score cards, anthropometric tables and Pamphlets 5 and 7 wherever desired throughout the United States, besides having the privilege of answering questions or giving advice wherever and whenever requested The culmination of the preparation for the different baby week campaigns throughout the country has given us the keenest gratification of our three years' service on the committee, because it has made it possible for us to serve in a practical, concrete way the organizations, the women's clubs and the Children's Bureau, which we feel it is our especial function to serve

From the beginning of this movement, state and county fair associations have been among our strongest cooperative influences Through their support we have been able to work out many of our theories into practical results The last year one state fair issued a baby book containing the American Medical Score Card, anthropometric table, list of books on babies, and a complete classification of the babies entering the conference Ten thousand copies of these baby books were given out as programs to the audiences

For portions of the country where it is still considered necessary to hold contests, we desire to emphasize the value of the improvement class, in which the subnormal child is given a chance to show development

Following the examinations at one state fair conference, a questionnaire was sent out to the parents, and a large number of answers received The questions, together with a few significant replies, follows

1 What benefit did you expect to derive by entering your baby at the conference?

1 To find his weak and strong points both physically and mentally and find a means of developing him along most needed lines
2 We wanted to know her defects and learn the way to remedy them, also how she would score compared with others her age, in short, how nearly perfect she was
3 To learn his condition mentally and physically
4 We had the satisfaction of knowing whether the babies were being properly taken care of or not, and how they compared with others
5 I wish for professional opinion concerning baby's health weight, measurements, etc, also to compare him with other healthy babies of his age.

2 Did the benefit meet with your expectations?

Out of fifty-three answers, forty-two were positively "yes" five "No," and six "not entirely"

3 What phase of the examination appealed to you as the most satisfactory, and why?

1 Every phase of the examination appealed to me as being extremely important
2 How to feed my baby properly
3 The advice and kindly talk the last doctor gave me.
4 The psychologic examination, because I wanted to know if my child's mind was properly developed
5 The punctuality of appointment for examining The thoroughness of examination The interest shown the children and parents

4 What phase the least satisfactory, and why?

1 Points being taken off and no explanation
2 The child that will "show off" is the one who scores high, while a shy child falls short regardless of how much he knows
3 Examination of the throat
4 The mental development, because children under 3 years of age vary so greatly
5 The mental, because a baby will do things at home that he will not do for strangers

5 If your child is of correct age will you enter him in the improvement class next year? Why?

1 Yes, I want to know how much they have improved
2 Yes, because I am trying to bring him up to standard
3 Yes, to find out the defects as well as improvements.
4 My boy is over age and being physically perfect, except for a birth mark, there is no chance for improvement

6 Aside from your own experience what is your opinion concerning the value of measuring and scoring babies?

1 It is one of the best and most helpful movements that has been undertaken in recent years
2 It will make the parents more careful of their condition before a child is born as well as after he is born
3 Parents take more interest in their children and try to develop them to exact measurements
4 It is a good movement in the right direction, as it induces thoroughness that might otherwise be overlooked
5 It will help mothers to raise a better generation of children

7 Has the measuring and scoring of your baby had, so far, any practical value for you in its care? If so, what?

1 Yes, in the care of her teeth, also teaching self control
2 Yes, that one should devote all thought and time possible to the child, training him both mentally and physically
3 Yes, in his diet and more regular feeding
4 Suggestions of the examining doctors have been carried out successfully
5 Yes, it has given us a keener insight of her physical training
6 Yes, the pointing out to us the danger of doing nothing for flat feet and weak ankles We didn't realize the necessity for orthopedic treatment

The second edition of Pamphlet 5 having been exhausted during the last year, we seized the opportunity to revise the pamphlet and make it more completely meet the requirements of the baby movement as now developed The revised copy is now in the hands of the public.

In the second year of my chairmanship we issued an anthropometric table compiled by Mr F S Crum During the third year we have secured 10,000 score cards and have published a new anthropometric table compiled by Mr Crum which is now available We are at present endeavoring to secure from different sections of the country several thousand score cards on which we wish to base still another table It is also our intention to tabulate all remediable defects from these cards If the results are significant, we shall print them and turn them over to the Children's Bureau and to the proper authorities of the states from which they come We have already received 1,000 cards from one state, and the promise of 1,000 each from several other states Seven states are planning to issue bulletins in which will be tabulated all facts of statistical value connected with this investigation of remediable defects May we here urge that other states furnish us with the names of physicians who will be responsible for collecting and sending to us duplicates of score cards secured from contests or conferences in their locality?

During the past year all *orders* for contests and conferences have been filled by Dr Frederick R Green, Secretary of the Council on Health and Public Instruction, from the Chicago office From our own office we have sent *sample* material *only* The following represents the list of sample copies issued score cards, 2 557, duplicates, 3,550, anthropometric tables, 504, Pamphlet 5, 555, Pamphlet 7 608 Practically each of the foregoing samples was accompanied by a letter from our committee

The Central Committee, which have given us valuable and steady assistance for this year is composed of Rosa L. Gantt, Spartanburg, S C , Samuel Jay Crumbine, Topeka, Kan , M Nelson Voldeng Woodward, Iowa, Grace L Meigs, Washington, D C , Phoebe Van Voast, New York, Margaret V Clark, Long Beach, Calif , and Frances Sage Bradley, Atlanta, Ga

The members of the Score Card Committee are Henry L K. Shaw, Albany, N Y , Velura E Powell Red Oak, Iowa, Josephine Baker, New York, Howard Childs Carpenter, Philadelphia, and Lenna L Meanes, ex-officio, Des Moines, Iowa This committee is constantly at work revising and perfecting the score card Dr Henry L K. Shaw as chairman of this committee has done much toward establishing the scientific value of this card, and in inspiring confidence in that value

In conclusion we wish to acknowledge with hearty appreciation the support given us by our Council, the splendid recognition by the Children's Bureau, and the universal cooperation of the women's clubs

Respectfully submitted

Sophie Hinze Scott, Secretary

Committee on Cancer

To the Council on Health and Public Instruction

Your committee as a committee has done very little during the past year, but each individual has done his share in disseminating knowledge as to what can be accomplished when cancer is recognized early Dr Bloodgood has been particularly active, and in addition to numerous lectures in the East he has made an extensive tour of the Pacific Coast giving cancer talks to large lay and medical audiences

Last year your committee reported the publication of several pamphlets some dealing with the general subject of cancer others with cancer of individual organs During the last year we have published Dr Bloodgood s article on "What Every Woman Should Know About the Breast,' and the printer has in hand Dr Julius Friedenwald's article on Cancer of the Stomach' We have the manuscripts of several other important papers on cancer These will be published as the demand increases for more literature on the subject

Several years ago it was pointed out by Dr Frederick R. Green and others that there was a great multiplicity of committees and organizations scattered throughout the United States, and that while each was doing its best for the public welfare, there was much overlapping in their labors—much useless labor, in fact—as a result of the lack of coordination It was pointed out that with concerted action a great deal more could be accomplished with less labor

When your committee was appointed, the committee of the Congress of the Surgeons of America had been in existence for several years, and the American Society for the Control of Cancer had recently been organized After mature deliberation it was deemed best to let the American Society for the Control of Cancer take the more active part, as it in a large measure came into being through the efforts of the laity and they have contributed mainly to its support This society during the year has been establishing state and local committees, and will soon have the country well supplied with local centers from which cancer knowledge will be distributed It has been the desire on our part to avoid duplication of the work, and this accounts for our apparent inactivity

The knowledge of the laity concerning cancer is being disseminated more and more each day Your committee is doing excellent work in an advisary capacity and stands ready at any time to supplement the endeavors of the American Society for the Control of Cancer when it may be necessary The Council of the American Medical Association has rendered signal service in the publication and dissemination of the various pamphlets on cancer Just as soon as state and county organizations are fully completed and in action the cancer reprints will have an ever increasing sphere of usefulness The outlook in cancer is becoming more and more hopeful

Committee on Conservation of Vision

To the Council on Health and Public Instruction

During the past year, I have kept the *Press Bulletin* supplied with popular eye articles for newspaper use and can only regret that the *Bulletin* is not distributed every week as before, as I believe it is a source of supplying the public with plain health literature, which is much needed

Our committee and our state managers have had much to do with the enactment of eye legislation in several states It has also had much to do with the prosecution of a number of individuals (physicians, midwives and others) who have disobeyed the state laws concerning the welfare of eyesight

Our committee is endeavoring to teach the cheapness of health, but it is difficult to impress the public with this unanswerable truth It is cheaper to keep people well than to allow them to be sick It costs five times as much to educate a blind child as it does to educate a seeing child Sixty-five per cent of schoolchildren have some eye, ear, nose or throat defect that hinders education Unprogressive schoolchildren are called "repeaters," that is, they keep repeating their studies It costs $100,000,000 a year to educate 3,000,000 repeating American children This is mostly unnecessary, as only about 3 per cent. are really mentally defective If their physical defects are relieved, all but 3 per cent. will become average scholars This would be a great boon to themselves, their parents, their teachers and their community Over half of the criminals are poorly educated, and apparently mentally defective It is probable that if their physical defects had been corrected in early childhood so that the easy acquirement of an education had been possible, most of them would never have become criminals at all, they would have been happier, and enormous sums of money would have been deflected into worthier channels In such a reform, the eyes play an important part, for 87 per cent of our knowledge comes to us through our eyes, hence the supreme importance of good eyes for schoolchildren

Preventive eye work is very cheap but its results are big To drop silver nitrate into all new babies' eyes cost 2 cents per baby, but think of the misery and money it saves! It would remove 25 per cent. of the inmates of our blind asylums There are now 300 000 dependent blind in America costing $15,000,000 a year to support. The wearing of goggles in shops, and the use of protectives for dangerous machinery would cost but little, and would almost entirely prevent injury to eyes in shops Control over the manufacture and sale of wood alcohol, in its various seductive forms, would save many eyes and many lives, and would cost practically nothing Five hundred dollars a year, and the cooperation of teachers of a city the size of Chicago, would enormously improve the eye, ear, nose and throat conditions of the schoolchildren of that city, and would make teaching much easier, and much less expensive The teachers can make health surveys easily and efficiently if they will Plain instructions are printed, and there is no excuse for not doing it No medical education is necessary, and the little time devoted to the work would be amply repaid by the added ease and comfort of the teachers' work, as stupid children are made bright by treatment, operations, glasses, etc

No	State	Manager	Number of Lectures	Number of Lecturers	Number of Cities	Size of Aud'ences
1	Illinois	P Gulliford	9	5	9	3,300
2	Wisconsin	N M Black	6	4	4	800
3	Missouri	C Loeb	7	6	3	1 000[1]

20	Oklahoma	T F Davis	3	1	3	1,500
21	Alabama	S L Ledbetter	6	4	5	700[9]
	Total		284	81	267	84,900

It will thus be seen that during the past year lectures have been delivered in 21 states Three hundred and eighty four lectures have been delivered by 81 lecturers, in 267 cities to audiences estimated at 84 900 people In the two previous years of the existence of this committee 829 lectures were delivered to 183,328 people If we add to these figures the work of the past year, it will be seen that 1,213 lectures have been delivered to 268,223 people

[1] A local committee for the prevention of blindness has been formed at St Charles, Mo, under the influence of our National Committee

[2] Through the influence of our National Committee much was said on ocular salvation by lecturers who talked throughout the state, during Baby Week

[3] Through our Committee, the Nashville Board of Education adopted the eye, ear, nose and throat examination of schoolchildren

[4] Through our Committee, many cities have adopted the examination of schoolchildren's eyes, ears, noses and throats

[5] Mostly accomplished by workers of the Ohio Commission for the Blind

[6] Survey of eyes ears, noses and throats of schoolchildren commenced in Pine Bluff

[7] Given largely under the auspices of the New York State Committee for the Prevention of Blindness, the New York Association for the Blind, the National Committee for the Prevention of Blindness, etc

[8] Eye, ear, nose and throat inspection inaugurated in Mitchell, Aberdeen and Watertown Dr Parsons has organized a most successful society called the School Hygiene Association It has a membership of 300

[9] Montgomery and Cloverdale County have begun the annual and systematic examination of schoolchildren's eyes, ears, noses and throats, A law is being introduced in the Alabama legislature for the examination of schoolchildren's eyes, ears, noses and throats

Our committee is endeavoring to inspire the different states with the necessity for state activity along the lines of visual conservation The most efficient manner of doing this is by means of lectures in the different towns and cities These are arranged by the several state managers, whose duty it is to bring competent lecturers and receptive audiences together This is frequently very difficult work, and the state managers deserve much credit for their devoted and unselfish labor Many circumstances have conspired to make this rather a poor season for this work, and yet creditable work has been accomplished I give here an incomplete account of the past season's lectures, and desire to say that the suddenness of the call for this report renders it impossible for me to give a full report of the lecture season

Our committee has this season undertaken a most arduous but useful work, namely, the compilation of all the eye laws of the United States It is astonishing how ignorant almost every one is concerning the laws of their own states For instance, how many people in Idaho or New Jersey or Virginia could tell whether any law existed in their own state concerning trachoma or wood alcohol or schoolchildren's eyes, and still further, how many could tell what that law was, if any existed? It is to obviate just this ignorance that the committee is compiling the various eye laws Even when such laws are on the statute books they are difficult to find When this work is completed it will enable any one to tell at a glance if any law on any eye subject exists in any state, and if so just what is the reading of the law The articles are appearing quarterly in *Ophthalmology*, and when completed, will be published by The Journal in book form as a work of reference The titles of the articles are as follows

1 State Legislation Concerning Schoolchildrens' Eyes, Ears, Noses and Throats
2 State Legislation Concerning Ophthalmia Neonatorum.
3 State Legislation Concerning Trachoma
4 State Legislation Concerning Wood Alcohol
5 State Legislation Concerning Shop Accidents and Shop Conditions Affecting the Eye
6 State Legislation Concerning Optometry
7 State Legislation Concerning the Blind
8 Model Eye Laws for State Legislation

The first three of these articles have already appeared, and the others will follow in each issue of *Ophthalmology* The work of collecting this material has been very arduous, each article represents about 500 letters sent out from my office.

In closing my report I wish to say that our work would be much increased if the Council could furnish us with even a little more money than is at present allowed We need more stereopticon pictures and more pamphlets for liberal distribution We need short leaflets for wide distribution, in several languages, on "Babies' Sore Eyes," "Shop Accidents," "Factory Conditions Favoring Eye Salvation," "Wood Alcohol," etc The work of this committee should include conservation of hearing as well as the conservation of vision These and other things we need to advance in our work, and unless such steps are taken, our committee will languish and eventually die of starvation I earnestly recommend that these matters be taken into earnest consideration

Respectfully submitted.

Frank Allport, Chairman

Report of Committee on Cooperation With the National Education Association

To the Council on Health and Public Instruction

For four years the American Medical Association and the National Education Association have made special appropriations for the purpose of studying the hygienic and sanitary conditions of schools

It was early ascertained that the country school was sanitarily and hygienically behind the city school, and that the city school was steadily improving while the country school was at a standstill This has been stated in former reports of the committees Last year, 750,000 copies of the report were printed by the American Medical Association press, the expenses were paid by the Elizabeth McCormick Memorial Fund, and the reports were circulated by the U S Bureau of Education

This year's report of the committee, compiled by Thomas D Wood, M D, chairman of the National Education Committee, is now ready for the printer It is far more comprehensive and important than any former report It will be seen by the report that the work of the committees has just commenced The methods suggested for improving conditions are simple, scientific and practical, but patient and careful supervision will be indispensable It is sincerely hoped that the work so favorably launched may be continued until satisfactory results have been obtained in the rural schools throughout the land.

At the annual committee meeting in Detroit, the members present authorized for the work of the committee

First, the printing of a small introductory edition of a second report (of twenty-four pages) of our committee on The Health Care of Rural Schoolchildren"

Second, the reproduction of our committee charts in a pamphlet edition, to be distributed as effectively as may be and if possible, through the Bureau of Education

Third, the reproduction in actual size of an edition of 100 copies each of all or some of these charts, to meet the demands which we are receiving in considerable and increasing numbers for these charts The plan is to lend some sets of these charts in answer to requests for them, and to sell the sets or individual charts at cost in response to requests that may be received It seems desirable that the committee should have sets of these charts to lend to state and county fairs and to other exhibitions attended particularly by people from rural regions

Fourth, to undertake (when there may be sufficient funds made available for this purpose) under the auspices and supervision of the committee, a national investigation (in from ten to fifteen states) of the health and welfare of teachers

The principal obstacle in the way of further development of the committee's activities is lack of sufficient funds to finance the printing of a large edition of the second report, the reproduction of the charts for use in public health and educational exhibits, and the expenses of the nation-wide investigation of the health and welfare of teachers with the publication of a third pamphlet containing the results of this investigation This committee for its important work should have at least $5,000 a year for the next three years Unfortunately the resources of neither the American Medical Association nor the National Education Association will permit of such an appropriation It must therefore be found through the assistance and cooperation of other bodies or through the broad spirited philanthropy of some individual citizen

Respectfully submitted

R. W CORWIN, Chairman

Dr Ennion Williams Virginia, asked permission to present a statement bearing on the Report of the Council on Health and Public Instruction just read and have it referred to the Reference Committee on Legislation and Political Action

Dr A. R. Mitchell Nebraska moved that Dr Williams be permitted to present the report by title and that it be referred to the Reference Committee on Legislaion and Political Action

Seconded and carried

Report of the Council on Medical Education

Dr Arthur Dean Bevan Illinois, Chairman, presented the report of the Council on Medical Education, which was referred to the Reference Committee on Medical Education

The report follows

To the Members of the House of Delegates of the American Medical Association

Each year since 1905, the report to this body has shown a continued progress in medical education The large oversupply of medical colleges has given way to a more normal supply of greatly improved institutions The fact that such progress has been possible in a brief twelve years reveals how serious had become, up to that time, the conditions underlying medical education

In the thirty years following the Civil War, the number of medical colleges in the United States was rapidly increased, until in 1904 this country had over half of the world s supply Only a few of these institutions were well conducted, the majority were owned by individuals or joint stock corporations and conducted for profit In order to increase the profits, all methods were resorted to in the effort to attract students The enrolment in the medical colleges of the United States in 1904, therefore, was much larger than normal conditions would have brought

During the same thirty-year period, however, forces were being developed which would eventually demand an entirely different type of medical teaching institution It was during this period that medicine was placed on a scientific basis through the developments in pathology, bacteriology, physiology, physiologic chemistry and pharmacology These developments have revolutionized the study of medicine, they have made necessary a thorough preparation in the fundamental sciences and a longer and better correlated medical course As a result, the practice of medicine hereafter will be by men more thoroughly trained in the medical sciences

When the practice of medicine throughout the country is entirely on this scientific basis, the public will soon become familiar with the possibilities of modern medicine, and this, in turn, will eliminate once for all the dogmas and cults which have been and are doing so much harm This is the problem of the organized medical profession, and the American Medical Association is attacking it through the Council on Pharmacy and Chemistry, the Council on Medical Education and the Council on Health and Public Instruction The medical profession must clean its own house and get rid by education and propaganda of the ignorant, poorly qualified men in its own ranks as the first step toward placing the practice of medicine on a thoroughly sound, scientific basis It is pleasing to report that great progress is being made

THE CAMPAIGN FOR IMPROVEMENT

In 1905, conditions were ripe for the campaign which the Council on Medical Education has since been conducting, with the results of which you are already familiar The results after eleven years of this campaign are shown in Table 1 Although the oversupply of medical schools has been reduced by about 40 per cent, the number of higher standard colleges has been increased by over 80 per cent The figures in regard to medical students and graduates show an improvement in quality as compared with quantity in about the same proportions

TABLE 1—QUALITY VERSUS QUANTITY

THIS TABLE SHOWS THAT ALTHOUGH THE TOTALS OF COLLEGES STUDENTS AND GRADUATES HAVE BEEN DECREASED IN ELEVEN YEARS THE NUMBERS OF HIGH STANDARD COLLEGES BETTER EDUCATED STUDENTS AND BETTER TRAINED GRADUATES HAVE BEEN INCREASED

Medical Colleges	1904	1915
Totals of medical colleges	162	95
Totals having higher entrance standards	4	83
Percentages having higher requirements	2 5	87 4
Medical Students		
Totals in all colleges	28 142	14 891
Totals in high standard colleges	1 761	11,912
Percentages in high standard colleges	6 3	80 0
Medical Graduates		
Totals from all colleges	5 747	3 536
Totals from high standard colleges	369	2 652
Percentages from high standard colleges	6 4	75 0

Notable improvements have been brought about through the Medical Students' Register, which was established in accordance with the action taken by the House of Delegates in 1910 Through the facts shown by this register and the information obtained by inspections, the conditions in all medical schools, regarding the administration of entrance requirements, methods of teaching, facilities, etc., are now well known Practically all that was known prior to the organization of the Council was that standards were seriously low and that conditions were generally bad

Although the number of medical colleges has been greatly reduced, there is still no dearth in the supply of colleges Statistics show that fifty or sixty medical colleges could easily have cared for all students enrolled in the ninety-five which held sessions last year, without the expenditure of another dollar for teachers or equipment

The number of medical colleges will doubtless be further reduced, but statistics show that the lowest ebb in the attendance of medical students has perhaps already been reached Reports received from the ninety-five medical colleges now holding sessions show an increase over last year in the enrolment of freshman students This is especially true in the colleges which put the higher admission requirement into effect two or more years ago It is quite evident, therefore, that after a few years have been allowed for readjustment under the higher entrance standards, the enrolments of students will become normal

The "Ideal" and the American Standard

During the last twelve years the Council has endeavored to secure the general adoption of the standard referred to as the "ideal" standard, in our report to the House of Delegates in 1904 That standard was as follows

(*a*) A four-year high school course,
(*b*) A year devoted to college courses in physics, chemistry and biology,
(*c*) A four-year medical course, and
(*d*) A year as an intern in a hospital

The general adoption of this standard has been secured, so far as the year of physics, chemistry and biology and a four-year medical course are concerned It has been adopted by eighty-five of the ninety-five medical schools in this country As to the hospital intern year, a large majority of the medical school graduates voluntarily secure such work before beginning independent practice

The American Standard of Medical Education

As a result of the influence of colleges and universities, the ideal standard urged by the Council has been somewhat modified Educators generally advocated two years of premedical college preparation instead of one, and the medical schools gradually accepted that standard, so that at present fifty-four of the ninety-five medical colleges now require for admission two years of college work It is evident also that the twenty schools which will survive out of the remaining forty will likewise adopt this requirement, and that standard of preliminary education has been adopted by fifteen state licensing boards It is evident, therefore, that the American standard of medical education that is today most widely accepted and which in the near future will be legally required in every state of the Union is as follows

(*a*) After a four-year high school course,
(*b*) Two years of collegiate work, including courses in physics, chemistry, biology and a modern language,
(*c*) A four-year medical course, and
(*d*) A year as an intern in a hospital

It can be confidently predicted that such a standard will be the legal requirement in this country by 1920 The remaining steps that must be taken to bring this about are few and simple The state licensing boards will doubtless eliminate about twenty schools that are still a menace to sound medical education and efficient medical practice This will reduce the number of schools to about seventy, all of which will adopt acceptable requirements The state boards throughout the country should require the completion of a hospital internship before a condidate is admitted to the examination for medical licensure A study of the hospital year problem shows that the best solution is simply to insist on a hospital year as a necessary part of a medical training, and to urge the medical licensing board in each state to make it a legal requirement When these requirements are adopted by all states, American medical education will be on as high a basis as that of any other country in the world

The hospital internship has been developed in such a way that it affords a most valuable training This is in marked contrast with the required hospital year in Germany, where the intern is elbowed out by the permanent assistants and given little work and little training The hospital internship in this country is also more satisfactory than the plan of house physicians and surgeons in England which, as a rule, are appointments of only six months and open to a small proportion of graduates

The inspecting and classifying of the hospitals of the country is an important matter, especially in connection with the value of an internship served in them The Council has this work in hand It has been progressing slowly because we have not had sufficient funds to carry on the work properly The trustees of the American Medical Association have been requested to provide the funds necessary to prosecute the work more rapidly In the meantime the Carnegie Foundation has given the American College of Surgeons $10,000 a year for three years to be devoted to hospital inspection The Council will cooperate in every way possible to make this hospital inspection thorough and fruitful

More Medical College Mergers Needed

The developing of satisfactory medical education in this country has been hindered by the fact that in some of our important centers instead of one strong medical school there are several which have different standards and conflicting interests In most of the centers of medical education in Europe there is in each but one medical school, which receives the undivided support of the people, the profession, and as a rule the government Such a situation has many advantages There are in this country eleven states with no medical schools, twenty-one with but a single medical school and seventeen with two or more schools There are twelve cities having two or more separate schools

It would be desirable, therefore, to have in each medical center either one medical school, as exists in Berlin, Paris or Vienna, or a close affiliation of the existing medical schools Would it not be possible to establish in each medical center a single, strong medical teaching institution with all the advantages that a well organized arrangement brings with it? In the smaller medical centers with a quota of not to exceed from 400 to 500 students and where existing conditions permitted, a medical school with a single teaching unit, with single departments of anatomy, pathology, medicine, etc, would suffice. In large centers with from 1,000 to 2,000 medical students, however, several teaching units would be needed, each with its separate laboratories of anatomy, pathology, etc, and a number of medical and surgical clinics, since in a single laboratory of anatomy, for example, or in a single clinic, 1,000 or more students could not be properly taught Where there are now two or more universities with well established medical departments, a cooperative plan might be devised by which they could work in harmony and the several medical departments be made individual teaching units This would insure uniform requirements and advantages which could be obtained without interference with established university organizations, and much confusion and expense might be saved by a common administration They could with proper conditions exchange credits, municipal hospitals could be better utilized, endowments could be more easily secured, and postgraduate work could be better organized

It should be no more difficult to get several medical schools to cooperate in this way than to get a number of railroads to cooperate in a great union depot plan or to get a number of steel plants to form a steel trust It will require breadth of view, hard work and organizing ability, but the end sought is worth all the hard work necessary to accomplish it, and some such plan is necessary to bring about the best result in American medical education

Improved Standards of Licensure

As shown in Table 2, there are now thirty-two states which have adopted one or two years of college work as a minimum standard of preliminary education for those who seek the license to practice medicine in those states The table shows not only the number of years of premedical college work required by each state, but also the sessions in which students matriculating in medical colleges are affected by the increased requirement and the year in and after which it applies to all graduates A remarkable progress has been made in state board requirements since 1908, prior to which no state was requiring more than a four-year high school education as the minimum standard of preliminary education As will be noted, there are now thirty-three states which have adopted the higher standard, fifteen of which require as a minimum *two years* of premedical college work In three states, Arizona, Maryland and Washington, the medical practice acts specify that the educational requirements for the applicant who seeks the license to practice in those states are to be the same as those held by the Association of American Medical Colleges in the year he graduated The requirements in those states, therefore, are changed automatically with changes adopted by that association, which adopted the standards of one year of college work and two years of college work to take effect for all *matriculants* respectively in 1914 and 1918 The standards apply to all *graduates*, therefore, respectively in 1918 and 1922

The advances in standards of licensure since 1904 are further shown in Table 3 The most marked increase is in regard to the requirement of collegiate work, already referred to The next greatest increase (twenty-nine) is in the number of states—thirty-three—which are now refusing to recognize low standard colleges

Chartering of Educational Institutions

As a result of a special investigation, it is found that only ten states have provided any control over the chartering of educational institutions, and in two of these the restrictions do not apply to irregular professional schools or correspondence colleges In thirty-eight states, therefore, it appears that any coterie of men, by paying an insignificantly small fee, can obtain permission to open an institution with the avowed purpose of granting degrees no questions being asked as to whether the institution is properly equipped or has sufficiently qualified teachers to furnish the education usually demanded before such degrees are granted After they are organized, such institutions are usually responsible to no one, and are free to make use of questionable practices even to the actual barter in degrees and certificates Even after they are exposed, no legal machinery has been provided for revoking their charters or punishing the impostors As a rule the fees charged by such institutions are far in excess of the tuition charged by some of the best teaching institutions in the land

TABLE 2—STATE REQUIREMENTS OF HIGHER PRELIMINARY EDUCATION

There are now thirty two states which have adopted requirements of preliminary education in addition to a standard four year high school education These states the number of college years required and the time the higher requirements became effective are as follows

State Examining Board of	Number of Years Required	Affects Students Matriculating	Affects All Graduates
Requiring Two Years			
Alabama	2	1915-16	1919
Arizona	2	1918-19	1922
Colorado	2	1910-11	1914
Indiana	2	1911 12	1915
Iowa	2	1911 12	1915
Maryland	2	1918-19	1922
Minnesota	2	1908-09	1912
New Hampshire	2	1915-16	1919
New Jersey	2	1917 18	1921
North Dakota	2	1908-09	1912
Oklahoma	2	1917 18	1921
South Dakota	2	1911 12	1915
Virginia	2	1917 18	1921
Washington	2	1918-19	1922
Wisconsin	2	1915-16	1919
Requiring One Year			
Arizona*	1	1914-15	1918
Arkansas	1	1915-16	1919
California	1	1915-16	1919
Connecticut	1	1910-11	1914
Illinois	1	1915-16	1919
Indiana*	1	1910-11	1914
Kansas	1	1910-11	1914
Kentucky	1	1914 15	1918
Louisiana	1	1915-16	1919
Maryland*	1	1914-15	1918
Michigan	1	1914 15	1918
Mississippi	1	1915-16	1919
New Hampshire*	1	1914-15	1918
New Jersey*	1	1916-17	1920
North Carolina	1	1914-15	1918
Oklahoma*	1	1914-15	1918
Pennsylvania	1	1914 15	1918
Rhode Island	1	1914-15	1918

Texas	1	1914-15	1918
Utah	1	1913-14	1917
Vermont	1	1913-14	1917
Virginia*	1	1914-15	1918
Washington*	1	1914-15	1918
West Virginia	1	1917 18	1921

* The 2 year requirement also adopted effective later

New Form of Quackery

Through the lack of an adequate check on the chartering or conduct of such institutions a new and popular form of quackery has been established, which provides the easiest present-day method of evading the educational requirements of the medical practice laws 'Colleges' and "schools professing to turn out in a few brief weeks or months, by correspondence methods or otherwise, specialists in some branch related to medicine have been springing up in various states Briefly, the conditions have become so bad as to cause unnecessary but serious demoralization in the field of medical education, in the licensing of physicians and in the practice of the healing art The existence of such unregulated, unstandardized institutions is radically unfair to the ambitious students who have been beguiled into them, it has led to the development of an organized attempt to destroy or evade laws passed in the interest of the public and, worst of all, it is a serious menace to the public, since it is sweeping into the practice of the healing art large numbers of those who are insufficiently trained to assume responsibility for the care of the sick

Largest Number In Illinois

The largest number of these institutions at present is found in Illinois, where conditions are especially favorable Besides the Class C medical schools which continue to exist, there are in Illinois colleges of osteopathy, chiropractic, chiropody, naprapathy, somopathy, physcultopathy, refraction, optics and a legion of others, most of which have for their chief inducement elegantly printed diplomas conferring the degree of "doctor" of this, that or the other The courses offered for such degrees are in some instances so notably a makeshift as to be ridiculous, and an insult to education Some are offering courses under two or more titles, and others appear to be doing a retail business in dispensing degrees in all the 'forms" or 'systems" of healing which may have been or ever shall be enumerated

In Iowa several so-called chiropractic institutions have been chartered, which are reported to be without adequate equipment, and, with low entrance requirements, are turning out, by correspondence courses or other loose methods, relays of followers of that particular "school" Although "made in Iowa," these graduates are not permitted legally to practice in Iowa, but are turned into other states where adequate legal barriers have not been established against them Such institutions are found also in California, Massachusetts, Michigan, Minnesota, Missouri, Oklahoma and Pennsylvania

TABLE 3.—ADVANCES IN STATE LICENSURE REQUIREMENTS IN TWELVE YEARS

Requirement or Provision	States Having Provision for			States Still Having No Provision for
	1904	1916	Increase	
Preliminary Education				
Any requirement	20	45	25	4
A standard four year high school education or higher	10	39	29	10
One or two years of college work as a minimum	0	32	32	17
That all applicants be graduates of a medical college	36	48	12	1
That all applicants undergo an examination for license	45	48	3	1
Requirement of practical tests in the license examinations	1	7	6	42
Full authority by board to refuse recognition to low grade colleges	14	34	20	15
Boards refusing to recognize low grade colleges*	5	34	29	15
Reciprocal relations with other states	27	40	13	9
Single boards of medical examiners	36	42	6	7

* In three states Arkansas Connecticut and Florida each of which has three separate boards only the regular (nonsectarian) boards have refused recognition to low standard medical colleges

In the interests of the public there should be provided in every state some competent board or authority to have in charge not only the chartering of all educational institutions, but also the right to revoke the charter and close the doors of every institution which is not being conducted in an honorable manner and for a proper purpose

The eleven states which thus far have provided any means by which the charter of educational institutions may be guaranteed are Arkansas, Indiana, Maine, Maryland, Massachusetts, Nebraska, New Jersey, New York, North Carolina, Ohio and Pennsylvania

New York at present appears to have the most complete control of educational institutions In Maine, Massachusetts and North Carolina a special act of the legislature is necessary before an educational institution can obtain legal authority to grant degrees In Arkansas, Indiana, Maryland, New York, Ohio and Pennsylvania the charter must be obtained, directly or indirectly, through the state board, or department of education, or through a committee (Pennsylvania) closely connected with that department In Nebraska, application must be made to the judge of the district court, whose duty is to appoint one or more commissioners to investigate and vouch for the claims of the applicant Even in some of these states the authority has apparently been made to cover only so-called academic colleges and universities It is clear that such authority should be extended to include all institutions professing to give instruction in any subject, especially those bearing the name of "school," "academy," "college," "university" or the like, and also all institutions granting degrees of whatever kind The menace from such irresponsible, professedly "educational" institutions is much greater than is generally understood

RELATIONS WITH CANADA

The professional relations between Canada and the United States have always been most cordial For several years the medical schools of Canada have been regularly furnishing reports to the Council on Medical Education for publication with the statistics appearing annually in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION It is with surprise and with regret, therefore, that a discrimination against even the best medical colleges in the United States has been established in two provinces of Canada—Quebec and Ontario Graduates from even the highest grade medical schools in this country in order to secure licenses in the two provinces named are required to have taken an additional year's work in one of the medical schools of those provinces No objection could be raised if only graduates of some of the lower grade medical schools in the United States were thus debarred, but official information obtained makes it clear that no exceptions are made to the rule even for graduates of the medical schools of Johns Hopkins University, Leland Stanford Junior University, Cornell, Columbia, Western Reserve and other universities which require two, three or four years of collegiate work for admission to their medical departments, including not only thorough courses in physics, chemistry and biology but also a "reading knowledge" of French or German, or both, and the completion of other collegiate subjects This Canadian attitude is more arbitrary than that by the Conjoint Board of London, which recognizes the premedical college courses in physics, chemistry and biology if taken in a recognized college, and which admits to its final examinations graduates of twenty or more medical colleges of the United States

In Canada the student, after three years in high school, registers for a five-year course in the medical school, the first year of which is devoted largely to the premedical sciences, physics, chemistry and biology In the United States at present, in fifty medical schools, in addition to a four-year high school course, the student is required to complete *two years* of work in a standard liberal arts college, which work must have included the premedical sciences, physics, chemistry and biology, before he is admitted to the medical school For admission to thirty-five other medical colleges, one year of liberal arts college work beyond the four-year high school course is required, and this college year also must include courses in physics, chemistry and biology All the medical colleges in the United States, therefore, require, so far as time is concerned, *one* more year of high school work than is required in Canada, and fifty of the medical colleges of the United States require *two more* years of high school and college work than are required in Canada The courses in physics, chemistry and biology in both Canada and the United States are taught by university or college professors of those sciences, and not by teachers of medical subjects It is fair to assume, therefore, that the science courses in both countries are taught with equal thoroughness Such advantages as there may be would seem to be with the medical schools in the United States because of the additional training and the greater maturity of the students

DIFFERENT GRADES OF MEDICAL COLLEGES

Along with the inspections of the medical colleges in the United States which have been made by the Council on Medical Education, two complete tours of inspections were made of the medical colleges in Canada, the second having been completed during the college session of 1913-1914 Those inspections revealed the fact that Canada, like the United States, has several grades of medical schools[1] As already stated, not one of the medical schools of Canada requires for admission more than a high school education, represented by the completion of the eleventh grade One or two of the schools in the provinces of Quebec and Ontario require in addition the passing of an examination referred to as the "junior matriculation"

AMERICAN MEDICAL SCHOOLS GREATLY IMPROVED

It will be seen from the foregoing statements that conditions in education in the two countries are quite parallel except that entrance standards are now higher in the United States by one or two years During the remarkable reorganization that has been going on in this country since the beginning of the Council's work, conditions in the United States have been extensively improved There are now in the United States thirty or forty medical schools which will compare favorably with the medical schools of any other country During this development of medical education in the United States, American schools have been careful to avoid the weakness of both English and German systems of medical education and, under able supervision, have established thorough and complete courses of medical education

Considering all these things, therefore, it is hoped that our good friends in the medical profession of Quebec and Ontario will have their license laws so amended as to correct this unfair discrimination against the high grade medical colleges of the United States Evidences of efforts in this direction have already been received which, it is hoped, will be successful

RECIPROCAL RELATIONS WITH OTHER COUNTRIES

This calls attention to the fact that the time has arrived when a more careful discrimination should be used by the licensing boards of this country in the acceptance of credentials from foreign medical schools and in the licensing of graduates from such institutions There is certainly no reason why the states should keep a wide-open door for the heterogeneous stream of graduates from the medical schools of other countries, especially from those which do not show a disposition to return the courtesy Then there is also the question of providing for reciprocal relations with other countries in the recognition of the graduates of high grade medical schools

THE NATIONAL BOARD OF MEDICAL EXAMINERS

As is doubtless well known to the members of this body, for fourteen years or more there has been talk of a national board of medical examiners The confusion resulting from the fact that the licensing of physicians in this country rests with fifty individual licensing boards has emphasized the need for some national qualification which would be worthy of recognition by all states It was seen that no national body with legal powers could be established without first securing an amendment to the national constitution It was, therefore, quite evident that the board to have this matter in charge would need to be a voluntary organization and that its certificate, to be of value, would need to be based on unquestionable qualifications

---

[1] The classification of Canadian medical colleges is as follows

Class A University of Toronto, Faculty of Medicine, Toronto, Ont, McGill University, Faculty of Medicine, Montreal Que

Class B Dalhousie University, Faculty of Medicine, Halifax, N S Montreal School of Medicine and Surgery, Montreal, Que Laval University, Faculty of Medicine, Quebec, Que, University of Manitoba, Manitoba Medical College, Winnipeg, Man

Class C Queen's University, Faculty of Medicine, Kingston, Ont, Western University, Faculty of Medicine, London, Ont

The University of Alberta at Edmonton, besides the premedical year, gives only the first two years of the medical course as measured by that of the medical schools of the United States This college was not inspected

This matter was brought into prominence a year ago when President Rodman, in his address, stated that such a board had been organized So little was known at that time in regard to the details of the organization, however, that this portion of the President's address was referred to the Council on Medical Education for further information The following report was adopted last year by the House of Delegates

> The scope of the address was very comprehensive and instructive That portion which calls for the action of your committee namely, the advisability of establishing a board of national examiners, contains material worthy of further consideration of the House of Delegates and it is recommended that it be referred to the Council on Medical Education

In accordance with these instructions, the Council on Medical Education held a business meeting in Washington, Nov 27 1915, the object of which was to examine into the organization, personnel and methods of the National Board of Medical Examiners The executive committee of the national board as then organized, on invitation, was present

It was learned that the completion of the organization of this board in so comparatively short a space of time was due to the fact that funds sufficient to allow the organization to be completed and to pay the running expenses for several years were generously donated by the Carnegie Foundation for the Advancement of Teaching This information was obtained by Dr Rodman only a few months prior to the giving of his annual address, and since the national board had been for so many years a matter in which he was personally interested, it was but natural that he desired to have the matter announced in his presidential address to the American Medical Association

The Council was favorably impressed with the personnel of the membership of this board, which was as follows Admiral W C Braisted, Surgeon-General, U S Navy, president, Commander E R Stitt, U S Navy, Gen W C Gorgas, representing the U S Army, Col L A LaGarde, treasurer, representing the U S Army, Surg-Gen Rupert Blue representing the Public Health Service, Asst. Surg-Gen W C Rucker, representing the Public Health Service, Herbert Harlan, representing the Federation of State Medical Boards, Isadore Dyer, New Orleans, Victor C Vaughan, Ann Arbor, Mich , Henry Sewell, Denver, Louis B Wilson, Rochester Minn , E Wyllys Andrews, Chicago, Horace D Arnold, Boston, Austin Flint, Jr, New York, and William L Rodman secretary, Philadelphia

As a result of its business meeting, although the Council was in favor of the general scheme of a national board of medical examiners, nevertheless, it felt that further investigation was necessary before it could actually endorse the board as organized Plans were completed at the Washington meeting for the symposium on the subject which was held at the twelfth annual conference in Chicago, Feb 7 1916 The Council also accepted the invitation to have a delegate present at a business meeting of the board which was to be held in Washington, November 29, just following the Council s meeting At that meeting the Council was represented by its secretary and by Dr H D Arnold, who as may be noted, is also a member of the national board

The discussions at the board's business meeting favorably impressed the Council's representatives It was seen that the members were determined to have the affairs of the board conducted in a manner above question Instead of the original plan to have representatives on the board from certain organizations of physicians, it was decided to have six representatives from the government medical services two each from the United States Army, Navy and Public Health Services, three members from the state licensing boards, chosen through their national organization, the Federation of State Medical Boards, and six other physicians to be appointed at large

The surgeons-general of the Army, Navy and Public Health Services are to serve as long as they hold their respective offices All other members were by lot divided into groups of four, their terms being two, four and six years, so that the term of office of four would expire every two years and their successors would be appointed for a term of six years

Another fact which was learned at the meeting of the board was that the qualifications of physicians admitted to the examinations were to be properly safeguarded The discussions indicated also that the examinations were to be thorough and comprehensive Although the investigation thus far had already produced favorable impressions in regard to the personnel of the board, its manner of perpetuation, its representation, the safeguarding of the applicant's qualifications, and the character of the examination, nevertheless it was determined to make no expression of approval until after the symposium on the subject should be given in February, where there would be opportunity for a full discussion of the problem from every point of view

The members of the House of Delegates who were in attendance at the February conference know how thoroughly the subject was discussed and how satisfactorily all criticisms of the board were answered The last criticism which the Council might have made against the proposition was corrected by the announcement from the secretary of the board that it had been voted to require as a minimum standard of preliminary education two years of collegiate work in addition to a four-year high school education This was important, since otherwise at the very beginning the board's certificate could not have been recognized in ten states, owing to the fact that that standard of preliminary education had been adopted in those states In regard to the organization of this board, the facts are set forth in more detail in the constitution and by-laws, which are as follows

THE NATIONAL BOARD OF MEDICAL EXAMINERS FOR THE UNITED STATES

PREAMBLE

The need of a standard licensing body for the whole of the United States and territories tributary has occasioned the organization of a voluntary board of examiners, selected from the Medical Corps of the Army and Navy and the Public Health Service with the other members selected from the Federation of State Examining Boards and the medical profession of the United States That the creation of this board may be certain and its continuance assured it is proposed that it shall be governed by the following constitution and by laws as set forth

CONSTITUTION

I *Name or Title*—The name of this body shall be the National Board of Medical Examiners for the United States

II *Official Domicile*—The domicile of this board shall be in Washington District of Columbia.

III *Objects*—The objects of this board are (*a*) the establishment of a standard of examination and certification of graduates in medicine through which the recipient may be recognized for the licensure in the practice of medicine in the United States territories, and extraterritorial possessions on presentation of the proper credentials of this board

(*b*) A cooperation with the Board of Medical Examiners in individual states, territories and extraterritorial possessions of the United States by which licensure may be effected through registration of the credentials of this board

(*c*) A consistent high purpose of determining the qualifications of the candidate before this board so as to create his eligibility to the privileges above defined

(*d*) A democratic administration of the operation of this board in its own executive function as well as in its examinations which are to be conducted by all modern means to accomplish practical oral and written tests of the candidates efficiency and qualification

(*e*) To hold examinations at the domicile of the board and at such other locations as may be justified by the number of applicants their residence and the facilities for conducting examinations properly

IV *Personnel of the Board*—This board shall initially consist of fifteen members as follows Admiral William C Braisted Gen William C Gorgas Gen Rupert Blue, Commander Edward R. Stitt Col Louis A LaGarde Asst Surg Gen William C Rucker Dr Victor C Vaughan Dr Horace W Arnold Dr Austin Flint Dr William L Rodman Dr Henry Sewall Dr E. Wyllys Andrews, Dr Louis B Wilson Dr Herbert Harlan and Dr Isadore Dyer

Services of Members of the National Board of Medical Examiners

The three Surgeons General are to serve as long as they hold their respective offices.

The others have been divided into groups of four, by lot their terms being two four and six years after incorporation as follows

	Two Years	Four Years	Six Years
Service	Pub Health (Rucker)	Army (LaGarde)	Navy (Stitt)
Federation			Harlan
At large	Wilson	Vaughan	Andrews
At large	Rodman	Arnold	Sewall
At large	Flint	Dyer	

Hereafter the board shall comprise the Surgeon General of the Medical Corps of the Army and one other representative of the same service to be appointed by the Surgeon General, subject to the approval of the board

The Surgeon General of the Medical Corps of the Navy and one other representative of that service to be appointed by the Surgeon General, subject to the approval of the board

The Surgeon General of the Public Health Service and one other representative of that service to be appointed by the Surgeon General, subject to the approval of the board

Three members appointed by the Federation of State Medical Examining Boards, subject to the approval of the board

Six members at large elected by the existent National Board of Medical Examiners

The terms of service of these members of the board shall be as follows The Surgeons-General of the Medical Corps of the Army, the Navy and the Public Health Service shall continue as members of the board so long as they hold their offices as Surgeons General Nothing in this provision shall preclude their reappointment as members of the board

The other twelve members of the board shall serve for six years each, with the provision that the first board shall be so constituted that four members shall serve for six years, four members for four years and four members for two years, these terms of office to be determined by the Executive Committee The four new members appointed for a term of six years, as provided above, shall be one from the three federal services one from the Federation of State Examining Boards, and two elected by the existent National Board of Medical Examiners

There shall be nothing in this regulation which will prevent any one of the four retiring members of the board succeeding himself, if qualified by proper appointment, but no member of the board may serve more than two successive terms

V *Organization of the Board* (*a*) The officers of the board shall consist of a president, a secretary and a treasurer, who, with two members at large all annually elected by the board, shall constitute the Executive Committee of the board The secretary need not be a member of the board In such case he shall not vote

(*b*) *The Duties of the President* The president shall preside at all meetings of the board, he shall direct all business of the board ad interim he shall be chairman of the Executive Committee, he shall decide all matters of rule and practice not provided for in these regulations and he shall represent, in person or by deputy, the board on all occasions when the board is officially engaged With the secretary or treasurer he may issue and sign all fiscal documents for the disbursement of funds

In the event of absence or death of the president, the board shall elect a chairman, who shall in all particulars fill the office of president pro tempore

(*c*) *The Duties of the Secretary* The secretary shall have conduct of all of the public relations of the board in conjunction with the president and the Executive Committee He shall supervise and direct all arrangements for meetings of the board, examinations of candidates for licensure, and he shall fulfil the office of recorder and keeper of records With the treasurer or president he may issue and sign all fiscal documents for the disbursement of funds He shall be also secretary of the Executive Committee.

(*d*) *Duties of the Treasurer* The treasurer shall be custodian of all funds he shall deposit all moneys in a national bank in the city of Washington, keeping proper accounts of all receipts and disbursements With the secretary or president he may issue and sign all fiscal documents for the disbursement of funds Before each annual meeting of the board, he shall have a proper audit of his accounts by a qualified accountant, who shall make report through the secretary He shall furnish bond, if the board so order

(*e*) *Duties of the Executive Committee* The Executive Committee in the intervals between board meetings shall transact all business of the board, directing, through the president and secretary, the detail of public announcements and operations as these may relate to the board, its objects, purposes and business The operation of the Executive Committee shall be made a matter of record for report to the board at its stated meetings with a view to ratification, but without necessity of referendum of such business as may be regular or routine and not affecting the policy of the board

The Executive Committee shall hold meetings on the call of the chairman, and as often as may be necessary or advisable

VI *Meetings* The regular annual meeting of the board shall be held at the domicile of the board on ———— in each year This annual meeting shall be held for the purpose of electing officers, of electing new members, of receiving reports of the several officers, of the Executive Committee, and for the transaction of any other business which may be on the table

Other meetings may be called by the president on his own initiative, and other meetings shall be called on the demand of a majority of members of the board, provided such members give the president two weeks' notice of said meeting and provided the president thereafter give two weeks' notice before the date of the called meeting

VII *Amendments* Amendments to this constitution may be made at any regular annual meeting of the board on thirty days' notice in writing and on a three fourths' vote of the members present

BY LAWS

I *Order of Business*
  (*a*) Roll call
  (*b*) Reading of minutes
  (*c*) Communications
  (*d*) Unfinished business
  (*e*) New business
  (*f*) Recommendation of candidates for licensure
  (*g*) Election of licentiates
  (*h*) Nomination of officers and members and Executive Committee
  (*i*) Election of officers
  (*j*) Adjournment

II *Conduct of Meetings* Parliamentary rules as set down in Robert's or Cushing's Manuals

III Dates of examinations for licentiates, regulation of examinations detail of subjects, and their assignment, scope and time allowance shall all be determined by the Executive Committee

IV Amendments to the by laws may be made at any regular meeting of the National Board of Medical Examiners by presentation in writing and by a two thirds vote of the members present

The thoroughness of the examination which has been planned by the board is set forth in the following

GENERAL SCHEME OF EXAMINATION OF CANDIDATES FOR LICENTIATE OF THE NATIONAL BOARD OF MEDICAL EXAMINERS

I PRELIMINARIES

Personal registration of candidates.

Review of credentials of candidates by board or by a qualification committee of the board

Assignment of candidates in groups for examination

II ARRANGEMENT OF EXAMINATIONS ACCORDING TO SUBJECTS AND DAYS

	A M	P M
First Day		
Anatomy and Its Divisions	Group 1	Group 2
Chemistry (and Physics)	Group 2	Group 1
Second Day		
Hygiene and Its Divisions	Group 1	Group 2
Materia Medica, Pharmacology and Therapeutics	Group 2	Group 1
Third Day		
Medical Jurisprudence (Forensic Medicine)	Groups 1 and 2	
Obstetrics and Gynecology		Groups 1 and 2
Fourth Day		
Medicine and Its Divisions	Group 1	Group 2
Surgery and Its Divisions	Group 2	Group 1
Fifth Day		
Pathology and Its Divisions	Group 1	Group 2
Physiology	Group 2	Group 1
Sixth Day		
Medicine at Hospitals and Clinics	Group 1	Group 2
Surgery at Hospitals and Clinics	Group 2	Group 1

III METHOD OF EVALUATING CREDITS IN EXAMINATION

Each examiner to base grades of paper on basis of 100

Grouped examinations by different examiners to be collated or arranged on basis of 100 per cent, allowing rates of credit according to importance of the unit represented by subdivision of subjects (for example Psychiatry, under Medicine, Operative Surgery, under Surgery)

All grades to be tabulated opposite the title or number assigned to candidate in separate lists for each general division of the examination.

All lists to be assembled and presented at a meeting of the entire examining board when each division should be reduced to a percentage based upon the following table of values

SUBJECT VALUES

1	Anatomy	100
2	Chemistry (and Physics)	50
3	Hygiene (and Sanitary Science)	50
4	Materia Medica, Pharmacology and Therapeutics	100
5	Medical Jurisprudence	50
6	Medicine	200
7	Obstetrics and Gynecology	100
8	Pathology	100
9	Physiology	50
10	Surgery	200
	Total	1,000

Passing grade to be 75 per cent average

One subject with grade below 50 per cent fails

Two subjects with grades below 70 per cent fails

Three subjects with grades below 75 per cent. fails

Candidates failing at the *first* examination before board may take a *second* examination after one year, a *third* examination will not be allowed

DETAIL OF SUBJECT DIVISIONS AND SUBDIVISIONS

WITH SUGGESTED NUMBER OF QUESTIONS AND SCOPE AFTER EXAMINATION BRIEFLY STATED

1 Anatomy	
Microscopic	
Embryology	3 questions 3 specimens for determination, etc.
Histology and Organology	5 questions 5 specimens for determination, etc
Neurology	3 questions 3 specimens for determination, etc.
Gross	
Osteology	3 questions 3 specimens for determination, etc
Dissection	3 questions Practical examination and demonstration to be determined by examiner
Applied	
Regional, Topographic, Surgical	3 questions Practical examination models sections etc, to be determined by examiner
2 Chemistry (and Physics)	
Organic	3 questions Practical examination at desk.
Physiologic	3 questions Practical demonstration at desk or written detail of experiment on test.
Physics	3 questions Practical demonstration at desk or written detail of experiment, etc
3 Hygiene (and Sanitary Science) Sanitary Chemistry	5 questions on general hygiene. Demonstration in laboratory of public health or 5 questions on laboratory tests, etc
Vital Statistics	3 questions
State Medicine	3 questions

4 Materia Medica, Pharmacology and Therapeutics	
Materia Medica	5 questions
Pharmacology	3 questions and laboratory demonstration, or 3 questions on laboratory experimentation
Therapeutics and Prescription Writing	5 questions, with examples of application of prescription writing
Electrotherapeutics (including Radiotherapy)	2 questions.
5 Medical Jurisprudence (Forensic Medicine)	5 questions
6 Medicine	
Theory and Practice	5 questions
Physical Diagnosis	Practical demonstration
Clinical Diagnosis	Practical examination on actual cases at bedside and clinic
Clinical Microscopy (Laboratory of Clinical Medicine)	Desk examination on specimens, etc, and three questions
Diseases of Nervous System (including Psychiatry)	3 questions
Diseases of Children	3 questions
Tropical Medicine	3 questions
7 Obstetrics and Gynecology	10 questions Requirement of cases attended, properly certified
8 Pathology (and Bacteriology)	
Bacteriology	5 questions and identifications of specimens outlines etc.
Microscopic Pathology	3 questions 3 specimens for determination, etc.
Gross Pathology (Necropsy, Autopsy)	3 questions and identification of specimens etc.
Surgical Pathology (Special Pathology)	5 questions and identification of specimens.
9 Physiology	10 questions (5 of which on subjects of text 5 on experimental or laboratory physiology)
10 Surgery	
General (including Minor Surgery)	5 questions
Operative Surgery	Practical demonstration.
Special Surgery	
Ear Nose and Throat	1 question
Eye	1 question.
Genito-Urinary	1 question
Orthopedics	1 question.
Radiology	1 question
Skin Diseases	1 question.
Syphilis and Venereal Diseases	1 question

Clinical diagnosis and treatment to be made subject of practical examinations at hospitals and clinics

Although no examinations have as yet been held, the Council feels confident that the certificates granted by this board will be worthy of acceptance by every state licensing board. The Council believes, further, that through the examinations given by this board the number of physicians in the Medical Reserve Corps who can be called on to aid the government in any national emergency will be greatly increased It was believed also that through the examinations conducted by this board an avenue will be provided by which reciprocal relations in medical licensure may be established with other countries, offers of which have already been made by some of the countries of South America

Recommendation

Considering the well arranged plan followed in the organization of this board, representing, as it does, two legal forces, namely, the government medical services and the state licensing boards, and considering the personnel of the board as it is now constituted, the plan for its perpetuation, the fact that finances have been generously provided for its maintenance for a number of years, the safeguards which have been established for the securing of reasonably high preliminary qualifications, and the arrangement for a comprehensive and thorough examination, the Council is glad to report that it can recommend the endorsement of this national board as it now stands

Respectfully submitted

Arthur Dean Bevan, Chairman,
William D Haggard,
James W Holland,
Horace D Arnold,
Robert C. Coffey,
N P Colwell, Secretary

Report of the Council on Scientific Assembly

It was moved that the Report of the Council on Scientific Assembly be received as printed in the Handbook and referred to the Reference Committee on Reports of Officers

Seconded and carried

The Report is as follows

To the Members of the House of Delegates of the American Medical Association

The Council on Scientific Assembly was constituted at the San Francisco session This, therefore, is our first report, and it must be regarded as a report of progress We have held one meeting at which were discussed various problems connected with the section work of the annual scientific assembly

You referred to the Council on Scientific Assembly the report of the special Committee on Sections and Section Work submitted to you at the San Francisco session We carefully considered this excellent report and in the main agree with it As emphasized in that report there is no doubt that too many meetings are being held at the same time, to the disadvantage of the Fellows who attend the annual session We further agree with the report that the duplication of subjects presented in different sections at the same time could, and should, be avoided

As to the former The remedy, of course, is to reduce either the number of sections or the number of meetings and also of papers that shall be read in a section As to reducing the number of sections It does not seem feasible to do this at least for the time being, although we might eliminate one or possibly two The Section on Hospitals was created five years ago and presented programs from 1912 to 1915 inclusive The registration has been extremely small—in 1912, 25, in 1913, 22, in 1914, 24 and in 1915, 26 This year, no program has been provided We recommend that this section be discontinued

As to reducing the number of papers We believe that this is possible, and that it could be done without in any way curtailing the value of the sections, in fact, that it would redound to the betterment of the sections

As a basis for classifying the sections regarding the maximum number of papers to be read before them, we suggest that the term "unit" be recognized and defined as meaning one meeting of a section held either in the forenoon or afternoon We recommend that the average number of papers assigned to a unit shall be six, and that the maximum number of units assigned to any one section shall be five. This will mean the discontinuance of the attempt to hold meetings on the morning of the fourth day of the Scientific Assembly This is practically the arrangement now being carried out Occasionally, one or two of the sections have met on the morning of the fourth day to complete their programs, but during the two annual sessions preceding this one, all the sections have adjourned on or before the close of the afternoon session of the third day

We recommend that, for the time being, to the following sections shall be assigned the number of units indicated

Practice of Medicine	5 units
Surgery General and Abdominal	5 units
Obstetrics Gynecology and Abdominal Surgery	5 units
Ophthalmology	5 units
Laryngology Otology and Rhinology	5 units
Diseases of Children	3 units
Pharmacology and Therapeutics	3 units
Pathology and Physiology	3 units
Stomatology	2 units
Nervous and Mental Diseases	3 units
Dermatology	3 units
Preventive Medicine and Public Health	3 units
Genito Urinary Diseases	2 units
Orthopedic Surgery	2 units

As to the duplication of subjects in different sections at the same annual session We believe that with the cooperation that will undoubtedly be rendered by the officers of the sections it will be possible in time so to arrange the programs that this duplication shall be entirely avoided We are not prepared at this time to make definite recommendations as to how this shall be accomplished, it is rather an important and more or less complicated subject, and we hope to study into it further with the cooperation of the section officers and make a more definite report later Connected with the problem, of course, is the fact that certain subjects in the past have been neglected, while too much time has been devoted to others no more important.

Before the reorganization in 1901, the delegates met in general meetings to transact the business of the Association At least one such general meeting was held on each of the first three days of the annual session, and at each of these general meetings an oration was delivered—one on practice, another on surgery, and another on state medicine After the House of Delegates was constituted, the general meetings were devoted to a meeting opening the scientific work of the session and to evening meetings at which the orations were delivered This proved unsatisfactory, it was overcrowding scientific work, and, as will be remembered, very few attended these evening gatherings to hear the orations The practice was, therefore, discontinued, and the different orations were then made optional with the three appropriate sections, only one of which now attempts to keep up the old form We, therefore, recommend that Section 3, Chapter XI of the By-Laws be amended by the elimination of the last sentence, which reads

"The Sections on Practice of Medicine, on Surgery, General and Abdominal, and on Preventive Medicine and Public Health may each elect a Fellow to deliver at the ensuing Scientific Assembly the oration on practice of medicine, the oration on surgery and the oration on state medicine before their respective sections"

As stated at the beginning of this report, your Council on Scientific Assembly feels the responsibility that has been placed upon it, and realizes that changes should be made only after due deliberation both on the part of the Council itself and on the part of the House of Delegates We therefore ask your action at this time on four things only (1) adoption of the definition of the word "unit", (2) The tentative adoption of the number of units assigned to the sections, (3) the discontinuance of the Section on Hospitals, and (4) the modification of the By-Laws regarding orations

Respectfully submitted

J SHELTON HORSLEY, GEORGE H SIMMONS,
E S JUDD, ALEXANDER R CRAIG
ROGER S MORRIS,

Dr Dwight H Murray, New York, moved that the following be submitted to the Reference Committee along with the Report of the Council on Scientific Assembly, namely, a recommendation that the Section on Stomatology shall be modified by adding thereto the subjects of Gastro-Enterology and Proctology, and that the Section as reconstituted be accorded three units

Memorial Resolution

Dr Arthur T McCormack, Kentucky, moved that when the House of Delegates adjourns, it adjourn in honor of the memory of Dr William L Rodman, Dr Frank J Lutz, and Dr Henry B Favill, who were respectively the President, a Trustee, and a Chairman of the Council on Health and Public Instruction

Seconded and carried

Report of Committee on Red Cross Medical Work

Dr George M Kober, District of Columbia, Chairman, presented the Report of the Committee on Red Cross, which was referred to the Reference Committee on Reports of Officers

The report is as follows

To the Members of the House of Delegates of the American Medical Association

A Committee on Red Cross Medical Work was created at the 1912 session in accordance with Section 3 of Chapter VIII of the By-Laws

The object of this committee is to stimulate in every county medical society the creation of a committee on Red Cross medical work so as to provide a body of representative physicians of approved qualification to direct or participate in medical work carried on by the Red Cross in different localities in times of war or emergencies and to advise with the representatives of that society in handling medical and sanitary problems incident to such an occurrence

It is desired to have in every county a central committee of five physicians, two of whom shall be the president and secretary of the county medical society, ex officio The president of the county medical society shall select the other three members, preferably from the list of councilors or of the executive committee This committee shall be designated the "Committee on Red Cross Medical Work" The names and residences of the members, immediately after organization, should be reported to the chairman of the American Medical Association committee In case of disaster requiring relief action by the Red Cross, these county committees will be called on to nominate qualified medical men in their respective counties for Red Cross service The committees will also serve in an advisory medical capacity to the Red Cross in time of disaster and in other lines of Red Cross activity as indicated in a preceding paragraph

Up to May 1, 1916, 588 county medical societies, located in forty-eight states, inclusive of the District of Columbia, have created committees on Red Cross medical work, and 2,940 representative men of the medical profession are available to render valuable assistance to the American Red Cross in any of its activities

During the present European war many of these committees have been called on by Major Robert U Patterson, Medical Corps, U S Army, and Chief of Bureau of Medical Service of the American Red Cross, to report on the qualifications of physicians and surgeons offering to serve the Red Cross in Europe The indorsements have been invaluable in the selection of men, as it is highly important that reputable men only be chosen, in order to protect the American Red Cross and the reputation of the medical profession whom they represent abroad Some of the committees have been called on to act as instructors and judges in contests organized by the First Aid Department of the Red Cross, for miners, railway service men, industrial workers, etc

NUMBER OF COUNTY MEDICAL SOCIETIES BY STATES WHICH HAVE APPOINTED COMMITTEES ON RED CROSS MEDICAL WORK

Alabama	8	Nebraska	12
Arizona	7	Nevada	1
Arkansas	14	New Hampshire	5
California	16	New Jersey	8
Colorado	8	New Mexico	6

Mississippi	11	Wisconsin	11
Missouri	21	Wyoming	1
Montana	5		
Total		588	

The Reference Committee on report of the officers at the session of the House of Delegates held June 21 to 24, 1915, deemed it advisable that the activities of your committee be directed through the state association rather than with the county societies directly This course will hereafter be pursued in spite of the considerable delay caused thereby

The American Red Cross in order to aid in the general cause of preparedness will appoint a national committee on Red Cross medical work for the purpose of coordinating the work of state and county committees with the various activities of the Red Cross A copy of the proposed regulations of the national committee on Red Cross medical service is herewith submitted (see Appendix A) It is believed that the central committee will approve these regulations at a meeting to be held during the month of May Upon the approval of these regulations it is the intention of your committee to renew its activities through the state medical societies, with the hope that the efforts will stimulate into existence the creation of committees on Red Cross medical work in all state and county societies which have not yet responded to the general call of preparedness

Your committee respectfully recommends that the President of the American Medical Association invite the attention of the state medical societies to the desirability of prompt organization of state and county committees on Red Cross medical work, so that the American medical profession may be prepared to respond should the country need their services

Respectfully submitted

George M Kober, Chairman
William J Lyster,
Medical Corps, U S Army
R. C Holcomb,
Surgeon U S Navy

Appendix A

REGULATIONS OF THE NATIONAL COMMITTEE ON RED CROSS MEDICAL SERVICE

REVISED BY THE SPECIAL COMMITTEE TO WHICH THEY WERE REFERRED BY THE EXECUTIVE COMMITTEE, FEB 12, 1916
FINAL DRAFT AS APPROVED BY THE COMMITTEE, MAY 3, 1916

Organization—The National Committee on Red Cross Medical Service shall consist of forty-six (46) members, thirty-six (36) to be appointed by the Central Committee of the American Red Cross, and ten (10) ex officio members The former shall be appointed, twelve to serve for one year, twelve to serve two years, and twelve to serve three years, and thereafter when vacancies occur the appointments to fill them shall be for three years The ex officio members shall be

The Surgeon General, U S Army
The Surgeon General, U S Navy
The Surgeon General, U S Public Health Service.
President American Medical Association
President, Congress of American Physicians and Surgeons
President, American College of Surgeons
The Director General of Military Relief
The Director General of Civilian Relief
The Chief of the Medical Bureau
The Chairman of the National Committee on Red Cross Nursing Service.

The director general of military relief shall be the chairman of this committee, and the chief of the medical bureau shall be its secretary, and its records shall be filed in the office of the former

No person shall be deemed qualified to be a member of the national committee who is not a member of the American Red Cross

Duties of the Committee—The duties of the national committee shall be as follows

To organize the medical service of the American Red Cross

To make uniform rules for enrolment.

To have general supervision over the work of state and other aids and committees organized for Red Cross work under agreement with the Presidents of the American Medical Association, the Congress of American Physicians and Surgeons and the American College of Surgeons

To aid the director general of military relief in the organization of field and hospital columns and the providing of the medical personnel for the same

To study the medical service of the Red Cross in other countries

The resolutions of the national committee shall be carried out as to administrative details by its secretary, and its routine business transacted by an executive committee of three appointed jointly by the President of the American Medical Association, the President of the Congress of American Physicians and Surgeons, and the President of the American College of Surgeons The chairman of the national committee shall be ex officio chairman of the executive committee. This committee shall have authority to receive and file in the national office of the Red Cross the applications and credentials of all physicians who have been approved by local committees or aids for enrollment as Red Cross medical officers, to enroll them and to issue them cards of appointment, to keep at the national office card catalogues of state and local committees, aids, and of enrolled physicians, to distribute blank forms of enrollment, and to give the necessary instructions to state and county committees

Assignment to Duty—Assignment to duty in case of war will be by the director general of military relief, in consultation with the surgeon general of the military service to which assignment is to be made Assignment in case of disaster to the civil population will be by him, in consultation with the director general of civilian relief

Meetings and Reports—The National Committee on Red Cross Medical Service will hold two meetings each year—one in Washington about the time of the annual meeting of the American Red Cross, and one at the time and place of the meeting of the American Medical Association Special meetings may be held on the call of the chairman, or at the request of one third of the committee members Nine (9) shall constitute a quorum at any meeting

Reports of the year's work shall be made to the chairman of the central committee at the time of the annual meeting of the American Red Cross in Washington

STATE COMMITTEES

State committees shall consist of not more than nine (9) physicians, who shall be members of the American Red Cross, and selected three members each by the President of the American Medical Association, the President of the Congress of American Physicians and Surgeons, and the President of the American College of Surgeons (one of them to be the president of the state medical society) This committee shall elect its own chairman and secretary, and shall hold annual meetings at the time and place of the state medical society meetings

Each state committee of the American Red Cross Medical Service shall be entitled to one delegate to the annual meeting of the American Red Cross held at Washington on the Wednesday preceding the second Thursday in December

Duties of State Committees—State committees shall correspond with county medical societies and other individuals or societies with reference to the organization and work of local committees or aids

They shall report to the chairman of the National Red Cross Medical Committee, at Washington, D C., the formation of all local committees, with the names and addresses of the members of the same

They shall have power to recommend to the national committee the dropping from a local committee of any member of such committee for reasons deemed by them sufficient, and shall report such action to the chairman of the National Red Cross Medical Committee at Washington

LOCAL COMMITTEES

Local committees shall be identical in membership with the Committee on Red Cross Medical Work appointed by the presidents of the state committees, provided that each member so appointed is or becomes a member of the American Red Cross

Duties of Local Committees—Local committees, in their capacity as representatives of the National Committee on Red Cross Medical Service, shall distribute blank forms for enrolment, provided by the National Red Cross Medical Committee, such forms to provide for enrolment for service in case of war as follows

Class A To consist of physicians willing to serve wherever needed, at home or abroad in field, hospital, supply columns, or intelligence sections

Class B To consist of those willing to serve in the home country only

Class C To consist of those willing to serve at place of residence only

They shall distribute forms also for enrolment in case of disaster under the three classes above specified

To determine whether applicants meet requirements and are desirable

To forward to the state committee applications for enrolment, with credentials and proper recommendations, including applications not recommended for acceptance

To recommend annulment of enrolment for sufficient cause, after proper investigation and granting a hearing to the physician concerned, forwarding all papers through the state committee to the chairman of the national committee at Washington for the final action of the national committee

To disseminate among physicians in good standing information as to the requirements of the medical service

Local committees shall meet at the call of the chairman, preferably at the time of the meeting of the county or other local medical society, and the secretaries of such committees may procure information, blank forms, necessary supplies, and the refundment of expenses and postage used in the correspondence of the committee about Red Cross matters, by application to the secretary of the National Red Cross Medical Committee, Washington, D C

RULES FOR ENROLMENT

Application for enrolment shall be made through the local committee, or on recommendation of a member of the National Red Cross Medical Committee

Blanks shall be filled out in the applicant's own handwriting

Requirements for Enrolment—The candidate for enrolment must be between 25 and 50 years of age, a graduate of a recognized medical school, licensed to practice in one of the states, and must be recommended by a local or state committee, or a member of the national committee on medical service In special cases physicians and surgeons may be enrolled by the national medical committee without reference to the above-named requirements, because of recognized special fitness and professional distinction

Full details will be furnished by the secretary of the national committee, at Washington

All persons, of whatever class, shall, if practicable, pass a satisfactory physical examination before being accepted for active service

All physicians enrolling must become members of the American Red Cross

Appointment and Badge—Certificates of appointment will be provided to all who enroll themselves

Resignation—A physician may resign, but should do so in writing to the secretary of the national medical committee through the county committee

Uniform—The uniform prescribed by the American Red Cross, and approved by the War Department, will be worn during service in time of war In time of disaster the usual civilian dress shall be worn Uniforms will usually be worn by organized units, such as field columns for drill inspection, camps and parades

Physicians are not at any time to wear Red Cross brassards without especial authority from the American Red Cross, and then only when engaged in active relief work In the event of war, such brassards can be issued only with the consent of the War or Navy departments

Physicians need not respond to a call for service in time of peace when such response would seriously interfere with duties already assumed, but in the event of war in which the United States may be involved, all Red Cross physicians would be expected to report to the chairman of the national medical committee at Washington, D C, the earliest possible date on which they could be available for active service in the class in which enrolled, and should thereafter hold themselves in readiness

Compensation—An enrolled physician called on for active service under the Red Cross will receive the same pay as is provided by law for a major in the United States Army medical corps in case his appointment is as a director, the pay of a captain, medical corps, for an assistant director, and that of lieutenant in the medical corps for a staff physician or surgeon, with proper maintenance, traveling expenses and laundry allowance

First Aid and Life Saving Courses—The National Committee on Red Cross Medical Service should interest itself in extending to the industrial employees of the country instruction in first aid and in life saving which are under the direction of the Medical Bureau of the American Red Cross

Dr Aruthur T McCormack, Kentucky, moved that the House of Delegates adjourn until Tuesday, 2 p m

Seconded and carried

Accordingly, the House thereupon adjourned

ADDENDUM

Report of the Judicial Council

[See page 1944, substitute for first four lines]

Dr Alexander Lambert, New York, Chairman, presented the Report of the Judicial Council, together with an addendum, reporting the action of the Judicial Council in disciplining members He followed this report with the report of the sub-committee of the Council on Health and Public Instruction on Social Insurance Following is the report on Discipline of Fellows

DISCIPLINE OF FELLOWS

During the year there has come before the Judicial Council one case for discipline During August and September, 1915, there was furnished to the secretary of the American Medical Association evidence in support of a charge that Dr George Ben Johnston of Richmond, Va, had been guilty of unprofessional advertising, that in a certain daily newspaper in Richmond, Va, Dr Johnston had caused to appear a cartoon of himself for medical advertising purposes and had paid for it himself This evidence was in the form of a letter addressed to the secretary of the American Medical Association from Dr Charles V Carrington of Richmond, Va, and supported by copies of correspondence between Dr J Shelton Horsley and the office of the newspaper which printed the cartoon The authenticity of these letters was confirmed by the secretary of the Association writing directly to Dr Horsley In addition, correspondence between the secretary of the Association and Dr Robert C Bryan, of Richmond, and other letters concerning this and other charges against Dr Johnston were presented to the Council In pursuance of the standing rule passed in San Francisco in June, 1915, that the secretary of the American Medical Association shall file charges with the Judicial Council against Fellows of the Association when overt acts on the part of such Fellows, supported by reasonable evidence, are brought to the attention of the secretary of the American Medical Association, the secretary of the American Medical Association transmitted the following letter to the Judicial Council

"Gentlemen The attention of the secretary of the American Medical Association has been called to a cartoon published in the Richmond *Evening Journal* for Jan 15, 1915, the subject of which is Dr George Ben Johnston of Richmond, Va, a Fellow of the American Medical Association, and to the photographic reproduction of the form of contract entered into by the Richmond *Evening Journal* and the subjects of a series of cartoons of which this of Dr Johnston is one, for the publication of these cartoons, together with correspondence which seems to establish the fact that Dr Johnston was a party to the publication of the cartoon in the Richmond *Evening Journal*, issue of Jan 15, 1915

"Consequently, in compliance with the standing rules adopted by the House of Delegates, the secretary charges Dr George Ben Johnston of Richmond, Va, with unprofessional conduct, in that he caused to appear in Richmond, Va, a cartoon calling attention to himself and his professional work in a manner contrary to Section 4, Article 1, Chapter II of the *Principles of Ethics* of the American Medical Association"

A meeting of the Judicial Council was duly set for Nov 5, 1915, to hear these charges At this meeting of the Judicial Council Dr George Ben Johnston appeared in person to answer to the charges The charges were read The chairman advised Dr Johnston of his rights and of the procedure of the Council Dr Johnston then stated that he had contracted and paid for the caricature complained of, as had also many prominent and reputable citizens of Richmond, including two other reputable physicians, without, however, any thought or expectation of professional advantage to be gained from it, as, in his opinion, such newspaper notice could not be of any professional advantage to a physician but, on the contrary, it might work an injury Dr Johnston further stated that he was actuated solely by the fact that many of his friends and neighbors of the highest standing in his community had signed the same contract form for cartoons of themselves He further stated that he did not see or instigate the reading matter attached to the cartoon and had no intimation of what would be printed in connection with his caricature and that he was humiliated by what appeared in that connection

There were further matters presented stating gross professional derelictions on the part of Dr Johnston These matters were not in the charges filed with the secretary of the American Medical Association and were therefore judged extraneous matter and could not come before the Judicial Council for its consideration Dr Johnston asked the opportunity to show animus in the matter of the charges, which opportunity was given him Dr Johnston produced a letter from Dr Stuart McGuire of Richmond, Va, in which Dr McGuire stated that he had been induced to permit a cartoon of himself to be published in this same *Evening Journal* of Richmond, for which he had also paid Dr McGuire went on to say that some weeks after the appearance of the cartoons of Dr George Ben Johnston, Dr W T Oppenheimer and Dr McGuire a letter was received by Dr McGuire from Dr H C Smith of Crewe, Va, who condemned his course for permitting the cartoon in the *Evening Journal* and who notified Dr McGuire that he, Dr Smith, had preferred charges to the Richmond Academy of Medicine and the Medical Society of Virginia against Dr Johnston, Dr Oppenheimer and Dr McGuire for unprofessional conduct Dr McGuire replied to this that he would welcome an opportunity to explain the circumstances which had led to the alleged violation of the Principles of Ethics, that he had afterward received a message from Dr Smith saying that the charges were withdrawn

Dr McGuire further stated that about this time Dr Charles V Carrington came to his office, the object being to ask Dr McGuire to take no action that would revive the charges and lead to an investigation by the local society, and that Dr Smith had been induced to withdraw his charges because it was believed that while the Judiciary Committee would exonerate Dr Johnston, Dr Oppenheimer and Dr McGuire of having intentionally done anything wrong the charges at that time would injure Dr McGuire Dr Carrington said that while he did not wish to hurt Dr Oppenheimer or Dr McGuire, he did wish to use the incident at some future occasion to injure Dr Johnston This statement Dr McGuire further said had been submitted to Dr Carrington, and Dr Carrington's recollection of the interview differed materially from Dr McGuire's Dr McGuire attached Dr Carrington's written version of the conversation from which it appeared that when Dr Carrington heard that Dr Smith had preferred charges against Drs Johnston, Oppenheimer and McGuire that he, Dr Carrington, had agreed with Dr Horsley to make every effort to have Dr Smith withdraw his charges against all these gentlemen, temporarily at least, because they believed the charges would injure Dr McGuire whom Dr Carrington believed to be unjustly accused of wrong doing Dr Carrington further stated that he believed even if charges were not withdrawn and the Richmond Academy of Medicine entertained them, all three of them would be exonerated Dr Carrington said at the time he went to see Dr McGuire to discuss these charges against Dr McGuire, he had no idea of preferring charges in this matter against Dr Johnston in any society, or of using it against Dr Johnston in any way at any future time Dr Carrington acknowledges however that he told Dr McGuire that while as Dr McGuire's friend he was interested in trying to help Dr McGuire out of an embarrassing situation, he had no such feeling for Dr Johnston and did not care how badly Dr Johnston was hurt Dr Carrington further states that after this conversation with Dr McGuire he (Dr Carrington) and Dr Horsley wrote a letter to Dr Smith in consequence of which Dr Smith withdrew his charges against all three

The Judicial Council believes that this is a type of case that should have been dealt with by the local medical societies before it should have been brought for action to the Judicial Council. The Judicial Council therefore, deprecates the withdrawal without trial or opportunity for defense by the accused, of these identical charges from the Richmond Academy of Medicine after being filed therein The Judicial Council does not condone or minimize unethical advertising in this or any instance, but the Council does believe that the matter complained of was inadvertent and thoughtless and was done with no thought of professional gain or personal advantage In view of this and the attitude of Dr Johnston in the premises, the Council believes that the facts elicited do not constitute sufficient cause for action, and the Council therefore acquits Dr Johnston of any intent whatsoever to violate the Principles of Ethics or to do an unprofessional act

Respectfully submitted

Alexander Lambert, Chairman,
James E Moore,
Hubert Work,
A B Cooke,
Randolph Winslow,
Alexander R Craig, Secretary

[See p 1945 Add first column, four lines from the bottom after the words "of the Scientific Assembly"]

It was further suggested to me this morning by Dr Simmons that a further amendment to the By-Laws should be considered in this connection—namely, that the general meeting of the American Medical Association should be changed from Tuesday morning to Tuesday evening, making the general meeting occur the evening before the meeting of the sections The Scientific Assembly, therefore, would begin on Wednesday morning and a half day of time could thus be saved

[See p 1985 Add second column following signature of Dr Alexander Lambert]

Dr Arthur T McCormack, Kentucky, moved that the House of Delegates extend its gratitude to Dr Lambert and his Committee on Social Insurance for the complete and exhaustive report that they had made

Seconded and carried

The report was referred to the Reference Committee on Amendments to the Constitution and By-Laws

(To be continued)

Factory Inspector's Report.—The report of the Illinois State Factory Inspector for 1914-1915 shows that 32,981 child labor inspections in 32,260 establishments were made during the year, which was an increase of more than 5,000 inspections over the previous year There were 156 convictions for infractions of the Child Labor Law, which provides that children under 14 shall not be employed in the industries At the sessions of the last legislature it was endeavored to have the limit raised to 16 years, but this failed The chief factory inspector favors raising the working age, among other reasons, because a physical examination before entering employment will be required of all workers in the near future, and he believes that beginning work at too early an age will so weaken and prevent the development of children that later when examinations are required many of them will fail of employment The state now has a ten-hour law for women and inspections disclose that in many instances they are worked longer than that. Two hundred and eighty-one prosecutions were brought for such violations The workmen's compensation act was improved by the last legislature and the minimum compensation for injury resulting in death was raised to $1,650, and the weekly compensation to $6 as a minimum Under the occupational disease law, 595 inspections were made and a few orders for compliance issued It is said more orders were not issued because many establishments have about completed installations in compliance with the law on previous general orders issued by the department Under the Health, Safety and Comfort Law, nearly 7,000 inspections were made in as many establishments, and over 39 000 orders were issued to correct defective and dangerous conditions in buildings, with reference to sanitation power transmission dangerous machines, etc. The law allows thirty days to comply with such orders On reinspection it was found that over 29 000 of these orders had been complied with Ventilation inspections under this law showed 245 violations out of 254 workrooms examined

PARIS LETTER

(Continued from page 1935)

The War

VENEREAL DISEASES IN THE ARMY

The various districts have just made a statistical return of the venereal diseases treated during the months of January and February, 1916, and from these returns, which are for the whole of the troops, including those at the front and those in the interior of the country, the following figures have been taken

Gonorrhea	7,813
Chancroid	962
Primary or recent syphilis	2,987
Total	11,762

Of this total of 11,762 infections, 9,419 have been proved to be contracted in the interior of the country This figure serves as the best indication of the existence and persistence of foci of contagion in the different districts, outside of the zone of the army

The undersecretary of state for the medical service has communicated these significant figures to generals in command of the districts, begging them to do their utmost, in cooperation with the civil authorities, to take every step necessary to stamp out the development of venereal diseases and to encourage every initiative and to avail themselves of every help with the view of checking the excessive prevalence of these diseases

TREATMENT OF ABDOMINAL WOUNDS AT THE FRONT

This subject has given rise at the Societe de chirurgie de Paris to a very interesting exchange of views Dr Tuffier of the Faculte de medecine de Paris was thought not to have been sufficiently categoric in the condemnation of the method of abstention, and had expressed himself as partisan of intervention only when the surgeon's equipment and the condition of the wound were such as to promote a favorable prognosis Professor Quenu opposed this opinion vigorously Quenu refuses to admit that soldiers with abdominal wounds should be abandoned to their fate because of insufficiency of the means of treatment The means of treatment exist, it will be sufficient to multiply during the period of actual battle the organizations for using them and to accumulate the latter where the most wounded congregate Drs Delbet, Rochard, Monprofit and Broca were of the same opinion, and the latter moved a resolution for a public pronouncement on the part of the Societe de chirurgie in favor of early intervention in abdominal wounds The societe passed this resolution unanimously In addition, a resolution was passed that, in order to insure for the seriously wounded, and especially those in whom early intervention has a considerable influence on the possibility of success, the automobile ambulances should be concentrated at the point where the most wounded are assembled according to needs and for the time necessary

RESECTION OR AMPUTATION

In serious wounds of the knee, elbow, hip and foot should the limb be amputated? Ought we to limit ourselves to the resection of the injured articulation? Drs Tuffier and Nove-Josserand, in a communication to the Academie de medecine, as the outcome of the study of the functional results given by resections, conclude that this operation should always be preferred to amputation, for it always leaves a limb more useful than any apparatus, whatever may be the perfection of the latter Amputation is justifiable only to save the life of the patient when, for that purpose, resection of the articulation would be insufficient One may have to practice such a resection either immediately after the infliction of the injury or later, in consequence of serious suppuration, or still later to increase the mobility and strength of the limb They give the results of 1,810 cases made up as follows 630 elbows, 350 shoulders, 282 knees, 231 ankles, 152 wrists, 122 hips, 29 posterior tarsus and 14 anterior tarsus Tuffier and Nove-Josserand state that for the shoulder joint the functions in the limb are good in 48 per cent of cases At the elbow results are variable, depending on whether or not the excision has taken place immediately after the infliction of the wound In the former case the functional results are not encouraging (30 per cent good), but still they are much better than would be given by an artificial forearm Secondly, the results are but little better (32 per cent) Approximately the same figures are obtained for the wrist For the lower limbs, on which they have performed 20 per cent fewer resections than on the upper limb, the operation at the hips gave about 75 per cent of favorable results A patient walking, with or without the help of an apparatus, is always at any rate better off than with a false limb As to the knee, in this case mobility is not sought by the operation, on the contrary, to give a really useful limb rigidity is necessary This result was obtained in 95 per cent. of the cases, but when this operation is performed immediately after the wound, the results, both as regards the life of the patient and the functions of the limb, are much superior to those which one obtains when the articulation is removed for suppuration The same is true for the operation on the foot

It is probable that the reason why these operations have not been more often practiced is that they are always laborious, very often difficult and can be carried out in a satisfactory manner only by experienced surgeons The instructions given long ago by the Lyons surgeon, Ollier, are those which one should follow to obtain the best results

INJUDICIOUS OPERATIONS ON THE EYE FROM A MILITARY POINT OF VIEW

In a previous letter I have mentioned Dr E Valude's opinion according to which wounded soldiers suffering from traumatic cataract of one eye should not be operated on if the other eye is intact and normal (The Journal, March 27, 1915, p 1089) Valude insisted on the fact that in such cases intervention cannot possibly produce in the vision any improvement of military value, and that a slight advantage in case of a successful result had to be set off against the danger of serious sequelae in operating early on cataracts, these traumatic cataracts being particularly liable to infection, especially in young subjects Finally, one has to face the possibility of a disastrous sympathetic ophthalmia consecutive to complications in the operated eye. In his original communication he spoke of this danger only as theoretical, but he has just observed a case in a soldier, aged 23, who, October 8, received from a shell fragment a serious contusion of the right ocular region without a wound As a result of this there was a traumatic cataract of the right eye but absolute integrity of the left eye He was transported to an ophthalmologic field hospital where he underwent an operation for the cataract, about December 7 Cyclitis resulted, and almost immediately an ultramalignant sympathetic ophthalmia of the left eye This soldier presents the signs of iridochoroiditis of the most formidable hemorrhagic type. Blindness is, of course, inevitable The result, from the point of view of the patient, is blindness at 23 years of age, and from the point of view of the state, first, a military unit lost, and, secondly, the highest pension to be paid to the patient, all because of an attempt to restore the vision which, in any case, would have been very imperfect and which would have been useless for military purposes

Valude is also of the opinion that the operation for strabismus should not be practiced in a military hospital The result cannot be of any military value

THE OCCUPATION OF SCHOOLS AS MILITARY HOSPITALS

The minister of public instruction has just received from the Federation des associations de parents d'eleves de lycees et colleges (Federated Association of the Parents of High School and College Pupils) a letter with regard to the prolonged occupation of a large number of schools as military hospitals To this letter were annexed complaints from different associations concerning the high schools of Paris, Algiers, Bordeaux, Grenoble, Limoges, Marseilles and Montpellier The inconvenience produced by the present situation was summed up in this way by the federation, overcrowding of the pupils in makeshift buildings which are altogether inadequate and very often insanitary, disturbance of the course of study, and dangers of epidemic.

DELAYED TETANUS

An interesting discussion took place at the Reunion medicale de la IV-e armee on the subject of delayed tetanus and of the preventive efficacy of antitetanic serum Dr Potherat, surgeon of the Paris hospitals, reported two characteristic examples In spite of the treatment by Baccelli's method and the administration of large doses of chloral one of the patients died, but the other recovered In the first patient the tetanus manifested itself three weeks after the receipt of the wound, in the second there was an interval of more than two months In the latter a fragment of shell which had escaped notice was left behind and was removed after roentgenoscopy The former, whose humerus had been smashed immediately below the tuberosities, had retained, among the irregularities of the scapular fragment, portions of clothing which were not detected by digital exploration or removed by washing Potherat attaches great importance to the presence of foreign bodies and in particular to fragments of clothing as bearers of tetanus bacilli in suppurating wounds Antitetanic serotherapy however certain and undeniable may be its preventive value, can never be depended on to overcome all the causes favoring development of tetanus It is efficacious but not infallible, and one must not neglect to supplement it by practices which have justified themselves in many a circumstance. These consist of free exposure of irregular and soiled wounds, the systematic ablation of necrosed or necrosing parts, the removal of all substances such as foreign bodies, which can be bearers of the tetanus bacillus, and finally careful and abundant washing with solutions which set free oxygen Though the objective phenomena are less violent in delayed tetanus than in the early form, it is erroneous to suppose that for this reason delayed tetanus is less serious, fatal results being quite common.

Dr Paul Boucher has reported two cases of delayed tetanus differing much from one another In the first case there was a penetrating wound of the chest due to a fragment of shell This patient received a prophylactic injection of antitetanic serum (10 c.c.) on the day of his reception at the ambulance, which was also the day on which he was wounded On the twentieth day, thoracotomy was performed for purulent pleurisy and the projectile was removed Tetanus made its appearance on the twenty-third day and was fatal Only one injection of serum had been given The second case belongs to a category which it will never be possible to avoid A man suffered a fracture of the vertebral column There was no perceptible external breach of continuity of the skin, nevertheless the man developed tetanus on the tenth day after the injury and he died One prophylactic injection had been given.

Dr Vincentelli brought forward a case of a man, aged 32, wounded by shell fragments in the two calves, in the shoulder and in the buttocks Each of these wounds narrow but very deep provoked a gangrenous phlegmon with fetid pus In the twenty-four hours which followed the receipt of his wound this man had one injection of antitetanic serum which was also the last. After five days' traveling he arrived at the hospital where the four phlegmons were opened up, drained and freely washed The pus and the fever disappeared almost completely Ten days later fragments of shell of clothes and of the right fibula were removed Everything seemed to be going on normally except that there were a very marked pallor and bluish venosities over the whole body whose origin it was difficult to explain Moreover, there was observed an excessive excitability of the muscles of the incised calf Twenty-three days after the receipt of his wound and after the only injection of serum and eight days after the second surgical intervention he was seized with tetanus which proved fatal in forty-eight hours

From these facts it may be concluded that the prophylactic action of antitetanic serum is of short duration, in some cases it has not extended beyond eight days Therefore in wounds with persistent suppuration the injection must be repeated every week.

Suppression of Rag Picking in Paris

At the Academie de medecine Dr Wurtz of the Faculté de medecine de Paris in the name of the Section of Public Hygiene, Legal Medicine and Medical Police read an important report on the question of suppression of rag picking in Paris The report demands that for reasons of public health, this practice should be suppressed in the capital and its neighborhood both on private premises and on the public streets The sorting of garbage should be undertaken solely in the municipal destructor works Garbage cans and wagons should be hermetically closed

An American Honored

Miss Edith Wharton an American citizen and writer has just been appointed, by decree chevalier of the national order of the Legion of Honor in recognition of her charity and her devotion to benevolent works

Miscellany

Medical Supervision in Industry

Dr A B Emmons, 2d, director of appointments for the medical alumni of the Harvard Medical School, in a recent article (Industrial Medical Supervision, *Boston Med and Surg Jour*, April 6, 1916, p 495) presents an account of the results of medical supervision in a factory employing from 700 to 1,100 workers, chiefly unskilled The factory in question manufactures candy, about two thirds of the employes are women The medical supervisor's duties are (1) to see that every employee who comes into contact with the candy or any of its ingredients is free from communicable disease, (2) to see that every new employee is physically fit for work, and (3) to keep the employees in good health Foremen or forewomen are instructed to report any worker who presents a cough, a rash or any other sign of physical ailment, in addition, the medical supervisor inspects every department, besides keeping office hours three times a week in the factory A graduate nurse is on duty all the time Every employee must be successfully vaccinated before he enters on his position, if he is temporarily absent from work, his health must be certified by the medical supervisor before he is allowed to resume his task. All persons suffering from venereal disease or tuberculosis, or addicted to the habitual excessive use of alcohol, are discharged, the first class because they constitute a danger to others, the second because employment in a factory is injurious to themselves as well as dangerous to others, and the third because to keep such persons near high-power machinery is to court disaster Employees affected with transmissible diseases are excluded from handling candy until they are well If some particular form of work affects an employee injuriously—for instance, if a man strains his back lifting barrels or a girl develops flatfoot from too much standing—the physician confers with the superintendent and secures a change of work for that employee The service is without cost to the employees The testimony of all concerned is that the medical supervision is of value to the employer in the greater efficiency of the working force, to the employees in the increased comfort and physical well-being secured, and to the public in the guarantee of a sanitary product It would seem that manufacturers of food products especially would find it to their advantage to install medical inspection, both for its direct and for its advertising value

Principal Causes of Death

The Bureau of the Census has just issued a bulletin of the principal causes of death in the registration area in 1914 More than 30 per cent of the 898,059 deaths reported from the registration area, which contains about two thirds of the population of the United States, were due to three causes heart disease tuberculosis and pneumonia More than 60 per cent of the total number of deaths were due to eleven causes In addition to the three named they were acute and chronic nephritis, cancer, diarrhea and enteritis, apoplexy, arterial diseases, diphtheria, diabetes and typhoid fever The deaths from heart disease numbered 99,534, or 150.8 per hundred thousand of population This is an increase over the rate of 1900, when it was only 123 1 The number of deaths from tuberculosis was 96,903, of which 84,366 were lung cases including acute miliary tuberculosis In the period from 1904 to 1914 the death rate from tuberculosis in all its forms fell from 200.7 to 146 8 per hundred thousand, the decline being continuous from year to year a decrease of more than 25 per cent. Pneumonia, including bronchial pneumonia, was responsible for 83 804 deaths in the registration area, or 127 per hundred thousand, the lowest rate on record Pneumonia like tuberculosis, has also shown a decline since 1900 when it was 180.5 per hundred thousand Acute and chronic nephritis had a death rate of 102 4 per hundred thousand, and is the only disease other than those named having a rate above 100 The total number of deaths [illegible]7,545, an increase from 89 per hundred thousand in 1900

St. Robert Zelig Library

to 103 4 in 1905 Cancer and other malignant growths caused 52,420 deaths, 19,889, or almost 38 per cent, were the result of cancer of the stomach and liver The rate for cancer has risen from 63 per hundred thousand in 1900 to 79 4 in 1914 Only two years during this time showed a decline as compared with the years immediately preceding, the increase having been almost constant Apoplexy showed 51,272 deaths, or 77 7 per hundred thousand The rate for apoplexy has also gradually increased, with only occasional slight declines since 1900, when it was 67 5 Arterial diseases caused 15,044 deaths, or 22 8 per hundred thousand It is said that no epidemic disease produced a death rate as high as 18 per hundred thousand in 1914 A notable decrease in these diseases was that for diphtheria In 1914 the deaths numbered 11,786, or 17 9 per hundred thousand, a fall from 43 3 in 1900, representing a decline of nearly 59 per cent Diabetes caused 10,666 deaths, a rate of 16.2, in 1900 it was 9 7 Typhoid fever declined since 1900 from 35 9 to 15 4, a fall of 57 per cent The epidemic maladies of childhood, whooping cough, measles and scarlet fever, caused 15,617 deaths, of both adults and children, or 23 7 per hundred thousand In 1913 measles led in the death rate of these three diseases, but in 1914 whooping cough had first place In every year since 1910 measles has caused more deaths than scarlet fever Interesting figures are also shown in regard to railway and street car accidents Railway accidents and injuries totaled 7,062 or 10 7 per hundred thousand This includes deaths from collision between railway trains and vehicles at grade crossings These figures are said to be the lowest on record Street car accidents and injuries numbered 1,673, or 2 5 This is likewise the lowest on record for this character of accidents There were 10,933 suicides, or 16 6 per hundred thousand

---

Public Health Threatened

The public health committee of the New York Academy of Medicine protests very properly against the monstrous resolution lately introduced in Congress by Senator Works of California for no imaginable purpose except to injure or discredit the endeavors of the United States Public Health Service If Senator Works were to have his way no officer or other person in this service would be permitted to join or be associated in any manner whatever with any public or private medical or scientific society

A more preposterous and absurd proposal was never laid before a body of legislators for serious consideration If the object is to separate the members of the Public Health Service from all others concerned in similar or kindred efforts it is rightly conceived, and, indeed, considering the whimsical views of the senator and his woeful ignorance of the problems of public health, it is clear that that is precisely what he aims at, his supposition being that the *American Medical Association* and all associations of scientific men are essentially evil

No one who has ever heard or read the vain and extravagant rhapsodies of Senator Works is likely to mistake him for a thinker or one competent either by nature or training to form a reasoned opinion on public health, but there is some danger that he may impart to others who do not take the trouble to think for themselves some tincture of his own suspicion that the great medical societies are engaged in a conspiracy to control the administration of public health for their own profit

Even the densest must see, however, that in an enterprise of this kind it is of essential importance that the officers of the government should be in close touch with those engaged in medical work throughout the country, and that nothing could be better calculated to paralyze the central body than to forbid association with learned bodies elsewhere Without the cooperation of all concerned in work of this nature, the United States Public Health Service would be useless and might as well be abolished outright Such an event would probably gratify Senator Works, but it may be hoped that few share his unenlightened conception of the matter —New York *Tribune*, May 16, 1916

Society Proceedings

ASSOCIATION OF AMERICAN PHYSICIANS

Thirty Fourth Annual Meeting held at Washington, D C, May 9 11, 1916

(Concluded from page 1886)

Blood Sugar Estimations as a Test of Carbohydrate Tolerance

Dr Louis V Hamman, Baltimore Frequent examinations of the blood and urine after the administration of glucose to fasting persons reveal four types of reaction 1 Normal reaction The blood sugar rises rapidly to a level not exceeding 0 15 per cent From this point it again rapidly declines, the whole reaction being over in less than two hours 2 Diabetic reaction The blood sugar rises more slowly, but reaches a higher point, 0.2 per cent and over The high point is maintained for some time, and the decline occurs gradually, the whole reaction occupying three hours or longer If the blood sugar rises above 0 175 per cent., sugar appears in the urine 3 Renal reaction In a small number of persons, although the blood sugar curve is in all other respects like the normal reaction, still sugar appears in the urine In severe cases of diabetes the same low renal threshold is often found 4 Nephritic reaction In many cases of nephritis the blood sugar rises to a high level, often exceeding 0.2 per cent, and the blood sugar curve resembles the diabetic reaction, however, no sugar, or only a trace of sugar, appears in the urine. Studies of the blood sugar reaction after the administration of glucose and its relation to glycosuria give valuable clinical data in diabetes and other conditions

Experimental Endocarditis Its Production with Streptococcus Viridans of Low Virulence

Drs H K Detweiler and W L Robinson, Toronto The cultures of *Streptococcus viridans* obtained from the blood in cases of chronic endocarditis were injected intravenously into a series of rabbits, and endocarditis was produced in a large number of cases The necropsy findings led us to believe that this organism has a special affinity for the heart valves The *Streptococcus viridans* obtained from the normal mouth is equally productive of heart lesions, and any grade of endocarditis may be produced by any one organism, depending on the amount injected, the number of injections, and the length of time between the first injection and the death of the animal

Starvation Treatment of Diabetes

Drs C F Martin and E H Mason, Montreal Observations of the metabolism in a number of cases of diabetes treated by the starvation method illustrate the speed with which one may arrive at the tolerance for various foodstuffs by this method, and also that hyperglycemia is a much better criterion of the dietetic needs than is the glycosuria Starvation, too, affects acidosis in different ways In diabetes it was found that the blood sugar curves, with the glucose test, differ constantly from those of the normal individual

DISCUSSION

Dr Abraham Jacobi, New York The starvation treatment of diabetes is very satisfactory to the experimental doctor, but what happens to the patient? I have seen patients with 5 or 6 per cent of sugar go along in satisfactory health for five or ten or even twenty years I have also seen starved patients, emaciated, suffering with cerebral anemia, complaining bitterly of other symptoms of nerve exhaustion, and now they are dead They would not be dead if they had not been starved Are not those living patients with glucose in the urine better off than those who died?

Dr S J Meltzer, New York I know of several persons who would have lived comfortably with glucose in the urine, but who were starved, developed acidosis, which was not discovered early, and died But they need not have died if the acidosis had been discovered The starvation treatment ought not to be used indiscriminately, but only when the physician is on the alert for the first signs of acidosis At any rate, it does not do to use the words "acidosis" and "dying" as synonymous.

Dr. J. Van Slyke, New York: The diabetic cases treated at the Rockefeller Institute are watched very carefully; some do well in acidosis, others much worse. If acidosis develops in the first fast it may not occur in the second. But the fast is always broken as soon as acidosis is observed.

Dr. M. Howard Fussell, Philadelphia: I have used the starvation treatment in a number of cases during the past year and not all of the patients were treated in hospitals, though all have done extremely well. Some have had severe acidosis, but all came out satisfactorily and all are now as comfortable as possible.

Dr. C. F. Martin, Montreal: I am sorry that Dr. Jacobi got the idea that I actually starved my patients; as a matter of fact they are not even hungry; they are not fasted to that extent.

Gastrohydrorrhea in Cirrhosis of the Liver Accompanied by Pyloric Stenosis

Dr. Max Einhorn, New York: A flow to the amount of from 1 to 1½ quarts a day was encountered in a patient suffering from cirrhosis of the liver accompanied by pyloric stenosis. No ascites had developed. At necropsy a typical cirrhotic liver and a pyloric tumor (cancerous) were found. The gastrohydrorrhea is explaind by a transudation process relieving the venous congestion in the stomach and is akin to an accumulation of ascitic fluid from the intestines in cirrhosis of the liver without pyloric obstruction.

DISCUSSION

Dr. H. A. Christian, Boston: I have observed a similar condition in cirrhosis patients both with and without ascites. I have always believed it to be a compensatory process.

Dr. Max Einhorn, New York: I have no doubt that the copious morning vomiting seen in many cases of cirrhosis and of cancer of the liver is due to failure of the portal circulation.

Effect of Exposure to Cold on Experimental Infection of the Respiratory Tract

Drs. James Alexander Miller and Willis C. Noble, New York: Our experiments were carried out with rabbits inoculated with *Bacillus bovisepticus*, an organism which causes the laboratory disease in rabbits known as "snuffles." It was selected for experiment because it produces in rabbits conditions very similar to those in respiratory infections in man and because of the relative difficulty of producing pneumococcus pneumonia in rabbits. The animals were kept in a warm temperature for varying periods of time and were then inoculated by spraying the nose and throat with virulent cultures of the "snuffles" bacillus. They were then immediately chilled by exposing them to cold weather. Two series of experiments in two successive winters were carried out. The totals for the two series show that of thirty-seven experimental animals, fifteen, or 40.5 per cent., reacted to the infection while of an equal number of controls, nine, or 24.3 per cent., reacted. The conclusion seems justified that exposure to cold after previous subjection to warm temperatures rendered rabbits somewhat more liable to infection with *B. bovisepticus*.

DISCUSSION

Dr. Henry Sewall, Denver: Throughout life we are constantly receiving antigens which protect us if we are in training and sensitize us if we let down the bars of hygienic indiscretions.

Dr. S. J. Meltzer, New York: Experiments seeking to show the relations between exposure to cold and lung infection must all fail for the present because the lungs are always maintained at the same temperature. But the same cannot be said of the nose and larynx; exposure to cold does cause a reaction in these parts and we begin to sneeze or cough. These symptoms are not diseases, however; they are efforts of the body to get rid of undesirable substances. While these effects of exposure do not cause disease, they undoubtedly open the way to disease. The only way to prove the matter so far as the lungs or bronchi are concerned would require the introduction of hot or cold air through a tube to the lung or bronchus where organisms had previously been placed. This would not afford complete evidence, however.

The Expectorant Action of Ammonium Chlorid

Dr. Warren Coleman, New York: Observations were made on the expectoration in bronchitis before and after administration of ammonium chlorid. The sputum was subjected to chemical examination which showed a large increase of ammonia nitrogen in sputum after the exhibition of ammonium chlorid. I took ½ grain doses of ammonium chlorid every two hours during the day (up to 7 p. m.). A distinct taste of the drug was perceptible in the sputum the next morning but not in the saliva. Another subjective observation was that the sense of bronchial rawness and tightness in bronchitis was relieved in half an hour after taking ammonium chlorid. The explanation of this effect probably lies in the water carriage of the drug when excreted by the bronchial mucosa, the mucous membrane and secretion being softened thereby.

DISCUSSION

Dr. Abraham Jacobi, New York: Ammonium chlorid will do something in chronic bronchitis in which the sputum is sticky and hard to raise.

Dr. S. J. Meltzer, New York: Dr. Coleman's interesting experiments do not decide the questions surrounding the expectorant action of ammonium chlorid. First, we should want a definition of expectorants; Dr. Coleman indicates that there are two kinds: secretion increasers and secretion removal helpers. The observation that a given substance is absent from a secretion is not evidence that the substance had no effect on the secretion; it may have done something in the blood. Physicians should not give up something that good clinical observers have found useful on the basis of mere experimental evidence. My observations for many years have been that ammonium chlorid does good in a "cold." It will not save a patient destined to die, but it is a good palliative remedy.

Dr. Joseph Erlanger, St. Louis: One could not be positive that the ammonium chlorid found in the sputum was excreted with it. What precautions were taken to see that no ammonium chlorid was retained in the mouth? Was any ammonium chlorid eliminated in the saliva?

Dr. L. G. Rowntree, Minneapolis: At what stage in acute bronchitis does Dr. Coleman believe ammonium chlorid is indicated? Is its action central or peripheral?

Dr. Warren Coleman, New York: Careful examinations of both sputum and saliva were made. Only a very slight ammonia reaction was found in the saliva. As to the stage of bronchitis in which ammonium chlorid is indicated, benefit may be expected after the first few doses given as soon as the first dry rawness in the bronchi appears. The effect of the drug is probably due to its elimination by the bronchial mucosa, the water carried with it softening the secretion.

Coagulation Time in Lobar Pneumonia

Dr. J. M. Anders and George H. Meeker, Philadelphia: The so-called Boggs test was employed, the blood obtained by free puncture of finger tip or ear lobe. It was found that in pneumonia coagulation time is slightly shortened, the mean time being nearly two minutes. As to the cause of the shortened coagulation time in pneumonia, there is no definite evidence. It occurred to us that the rapid destruction of leukocytes in the exudate might set free much enzyme and so set up the process. Calcium is not increased in pneumonia and therefore has no effect on the change in coagulation time.

DISCUSSION

Dr. S. J. Meltzer, New York: In similar experiments I observed no increase of calcium in nonvirulent pneumonia, but there is an increase of this element in experimental virulent pneumonia. Starch pneumonia is not attended with fibrin increase.

Dr. Rufus I. Cole, New York: Douchez found that in blood obtained direct from the vein in pneumonia the fibrinogen is increased, but the coagulation time is prolonged.

Action of Certain Diuretics in Chronic Nephritis

Dr H A Christian, Boston The effects of theocin (as representing diuretics) were varying there may be an increase or decrease of diuresis, of salt, of nitrogen, but sodium chlorid is more often increased than nitrogen, and tends to parallel water excretion The conclusion seems justified that theocin causes an inconstant and not marked effect in acute nephritis in man In chronic nephritis and chronic cardiorenal disease, theocin produces diuresis in inverse ratio to renal function When diuresis is induced, it is followed by reduced renal functions, suggesting the advisability of intermittent use of diuretics The fact that there may be diuresis without increase of nitrogen output makes questionable the use of diuretics for detoxicating purposes In many cases with severe nephritis, diuretics are probably harmful, being followed by no diuresis, no increase of urinary ingredients, and by diminution of renal function

DISCUSSION

Dr W S Thayer, Baltimore I have noted the beneficial effect of diuretics in cardiac disease, and also the danger of the continuous use of diuretics in severe renal disease

Dr J M Anders, Philadelphia I have relied on saline diuretics We should not employ diuretics unless the phenolsulphonephthalein test shows good functional capacity To aid elimination we have been used to giving large drafts of water, was this taken into consideration in the studies?

Dr L G Rowntree, Minneapolis Were there any observations on water alone as a diuretic?

Dr Henry A Christian, Boston The value of the phenolsulphonephthalein test will depend on whether a low output is due to chronic passive congestion or to tubular insufficiency The influence of water was not studied, however, all of the patients were on a constant fluid intake Water acts like other diuretics in shortening the lives of experimental nephritic animals

Toxic Effects of Urea on Normal Individuals

Drs A W Hewlett, Q O Gilbert, and A D Wickett, Ann Arbor, Mich In order to study the toxic effects of urea on man, about 100 gm of urea were taken by mouth within a few hours When the concentration of urea in the blood exceeded 160 mg per hundred c c of blood, the subject usually complained of headache, dizziness, drowsiness, mental apathy, inability to concentrate the attention, muscular weakness and fatigue and slight muscular tremor These symptoms are similar to those described in the asthenic types of uremia in which the blood urea approaches and often exceeds the threshold of symptoms observed in these experiments It is probable, therefore, that in this type of uremia many of the symptoms can be attributed to the high concentration of urea in the body In these experiments no nausea or loss of appetite occurred at the maximum level of urea in the blood, nor was there any marked rise of blood pressure

DISCUSSION

Dr Warren Coleman, New York An instructive case was that of a girl, aged 13 years, who came to hospital in uremic convulsions Blood taken for therapeutic purposes yielded of noncoagulable nitrogen a total of 20 mg per hundred c c In later convulsions other observations never found the noncoagulable nitrogen above 30 mg per hundred c c of blood It is evident that in some cases urea is not a factor in the convulsions

Dr Henry A Christian, Boston Dr Hewlett's observations coincide with my own on the noneffect of diuretics on the removal of nitrogen, and of their failure to influence the symptoms of uremia It is necessary to consider both blood accumulation of nitrogen and kidney excretion of nitrogen in these problems, storage is the factor rather than the amount in the blood How long did it take for the level of blood urea to return to normal?

Dr Charles S Bond, Richmond, Ind Did diuresis follow the ingestion of the urea, and how much water was taken during the experiments?

Dr A W Hewlett, Ann Arbor, Mich It is necessary to keep in mind that more substances are concerned in uremia than urea The time of the return of the urea level of the blood to normal was not ascertained, the observations were not continued long enough, the threshold of symptom production was passed on the down wave in six hours Tissues were studied, and showed that tissue concentration of urea was equal to that of the blood There was an enormous diuresis, shown to be independent of water intake in two cases

Factors in Normal Blood Destruction

Drs Peyton Rous and O H Robertson, New York Phagocytosis is not sufficient to account for blood destruction in man There is a gradual disintegration of red blood cells, with removal in the liver

The Metabolism and Treatment of Rheumatoid Arthritis

Dr Ralph Pemberton, Philadelphia Fifty cases of rheumatoid arthritis were treated by curtailment of carbohydrates, with subsidence of symptoms and with exacerbations following renewed carbohydrate feeding The restriction in diet may regulate the symptoms, whether or not focal infections are present The diet may be supplemented by protein to the necessary requirement, and the caloric requirement brought to normal by butter and olive oil There is a tendency of the urine to swing to alkaline with exacerbations of the disease

Vital Capacity of the Lungs, and Its Relation to Dyspnea in Heart Disease

Drs Francis W Peabody and John A Wentworth, Boston The production of dyspnea in patients with heart disease depends, in part, at least, on inability to increase the minute-volume of air breathed to as great an extent as can normal persons This is due to a decrease in the vital capacity which limits the depth of breathing The tendency of a patient to become dyspneic on exertion varies closely with the degree of the decrease in vital capacity The determination of the vital capacity gives an indication of the amount of exercise which will produce dyspnea, and is a guide to the severity of the functional disability of the case

Action of Opium Alkaloids and Their Combinations on the Vomiting Center

Dr David I Macht, Baltimore Nausea and vomiting are the most annoying symptoms produced by opium and its derivatives In a study of the seven principal alkaloids of opium, it was found that they could be divided into two groups (1) morphin, which causes vomiting, (2) all the others, which produce nausea feebly The minimal dose of morphin which produces vomiting in the dog was found to be (average) from 0 3 to 0 4 mg per kilogram of body weight Not only is vomiting produced by morphin, but the drug puts the vomiting center out of commission, no vomiting is induced thereafter by apomorphin Morphin and narcotin given together produced less vomiting than smaller doses of morphin alone, moreover, the combination did not produce exhaustion of the vomiting center, the same holds true for morphin in combination with narcein, and even more remarkable effects are seen when a mixture of the total alkaloids is given, the vomiting center is not put out of commission by this preparation The explanation of its favorable action probably lies in the molecular structure of the alkaloids The combination of opposites reduces the tendency to provoke nausea

Rôle of the Liver in Acute Polycythemia

Dr Paul D Lamson, New York As to the cause of the sudden increase of red cells in acute polycythemia, two theories are held (1) that polycythemia is due to sudden diminution of blood fluid with concentration of cells, and (2) that there is a sedimentation of red cells somewhere in the body, which if stirred up will suddenly increase the red cell count Epinephrin will cause a polycythemia in a few minutes, this reaches its height in fifteen minutes, and begins to fall in another fifteen minutes Experiments were made to fix the liver as the source of the influx of cells It appears that the increase of cells is not due to loss of plasma alone, but also to a sudden influx of stored cells The liver seems to be the organ that is responsible for both factors It is suggested that a physiologic influx of epinephrin may account for acute polycythemia, such as occurs after fright, etc

(Continued on page 2030)

Marriages

Lloyd Warren Ketron, M.D., Baltimore, to Miss Romola Cressey of Modesto, Calif., at Baltimore, May 21.

Walter Edwin Koppenbrink, M.D., St. Louis, to Miss Alice Miriam Lake of Higginsville, Mo., May 24.

Richard Ormond Leavenworth, M.D., Glencoe, Minn., to Miss Geneva M. Hilton of Minneapolis, June 14.

Raymond Clare Coleman, M.D., Estherville, Iowa, to Miss Josephine Dean Smith of Minneapolis, May 24.

Elmer Stanley Bagnall, M.D., Roslindale, Mass., to Miss Aida H. Salmon of Boonton, N. J., June 3.

George Edwin Deering, M.D., to Miss Agatha Louise Small, both of Worcester, Mass., recently.

Abraham Snell Park, M.D., Chicago, to Miss Laura Isabel Davidson of Owatonna, Minn., June 7.

Francis Gilman Blake, M.D., Boston, to Miss Dorothy Dewey of Springfield, Mass., June 1.

William Nelson Thomas, M.D., Oxford, N. C., to Miss Estelle Bullock, at Oxford, June 1.

Warren Yoder Thompson, M.D., to Miss Mary G. Kenworthy, both of Omaha, May 24.

Cary Eggleston, M.D., to Miss May Appleton Parker, both of New York City, June 3.

Walter Joseph Ream, M.D., Ladd, Ill., to Miss Marie Hall of St. Paul, June 1.

Deaths

Ambrose Talbot, M.D., Kansas City, Mo., Harvard Medical School, 1885, aged 55, a Fellow of the American Medical Association, visiting physician to St. Margaret's Hospital, Kansas City, Kan., medical director of the Kansas City Life Insurance Company and medical referee of the National Life Insurance Company of New York, instructor in clinical medicine in the medical department of the University of Kansas, once president of the Medical Section of the American Life Convention, died in his office in Kansas City, June 1, from cerebral hemorrhage.

Edward Orlando Greer, M.D., St. Louis; Marion-Sims College of Medicine, St. Louis, 1893, aged 50, formerly a Fellow of the American Medical Association, a member of the Missouri State Medical Association, from 1907 to 1911 professor of hydrotherapy and diseases of the abdominal viscera in Barnes Medical College, St. Louis, and for a year thereafter professor of clinical medicine in the National University of Arts and Sciences, St. Louis, formerly chief of the obstetric and gynecologic clinics in his alma mater, died at his home, May 27, from nephritis.

Andrew M. Peables, M.D., Auburn, Me.; Dartmouth Medical School, Hanover, N. H., 1864, aged 80, a Fellow of the American Medical Association and vice president of the Androscoggin County Medical Association, attending physician to the Central Maine General Hospital, of which he was one of the founders, a member of the Auburn School Board and city council, and a representative in the state legislature in 1869 and 1870, president of the board of health of Auburn, a director in two local banks, died at his home, May 24.

Francis Foerster, M.D., New York City; College of Physicians and Surgeons in the City of New York, 1883, aged 61, a Fellow of the American Medical Association and New York Academy of Medicine and of the American College of Surgeons; for ten years professor of gynecology in the New York Post-Graduate School; obstetrician and gynecologist to the German Hospital; died in that institution, June 1, after a long illness from abscess of the lung.

Edwin Alonzo Goodridge, M.D., Flushing, L. I., N. Y.; College of Physicians and Surgeons in the City of New York, 1871, aged 75, for thirty-four years a practitioner of Flushing, for five years president of the board of education and for many years trustee of the public schools, a veteran of the Civil War; at one time health officer of Flushing and surgeon to the Flushing Hospital, died at his home, May 31, from heart disease.

Thomas Elwin Murray, M.D., Great Falls, Mont.; Jefferson Medical College, 1908, aged 34, a member of the Medical Association of Montana, a registered pharmacist, health officer of Great Falls and vice president of the State Life Insurance Company of that city, who was operated on in April for relief of chronic appendicitis, died in St. Joseph's Hospital, Phoenix, Ariz., May 29, from endocarditis.

James Stenhouse, M.D., Denver; Denver College of Medicine, 1886, aged 56, head physician of the Pacific jurisdiction of the Woodmen of the World, visiting physician to the Denver City and County Hospital, founder of the People's Mission, Denver, formerly local surgeon for the Denver and Rio Grande and Union Pacific systems, died in St. Joseph's Hospital, Denver, May 24, from pneumonia.

John Evelyn Page, M.D., Santa Barbara, Calif.; University of Maryland, Baltimore, 1889, aged 49, surgeon (lieutenant-commander), U. S. Navy (retired), who entered the Navy June 18, 1890, and was retired on account of incapacity resulting from an incident of service, April 3, 1908, after seven years and eleven months' sea service and six years and eight months' shore or other duty; died May 28.

Albert Curtis Perveil, M.D., Brooklyn; New York University, New York City, 1894, aged 40, for two years surgeon of the Offin River Gold Mining Company in the Belgian Congo, West Africa, and who had been ill with sleeping sickness at his home in Brooklyn for several months, died in Roosevelt Hospital, New York City, May 31, from trypanosomiasis.

Walter John Wilson, M.D., Detroit; Detroit Medical College, 1879, aged 67, a Fellow of the American Medical Association and at one time president of the Detroit Academy of Medicine, while riding a motorcycle in Detroit, June 1, was struck by a street car and sustained a fracture of the skull from which he died in the Receiving Hospital, two hours later.

James Ferguson Vannice, Bishop Hill, Ill. (license, years of practice, Illinois, 1889), aged 76, a member of the Illinois State Medical Society, formerly a druggist, a veteran of the Civil War and a practitioner since 1867, for many years school director and clerk of the board of education of Bishop Hill; died at his home, May 25, from cerebral hemorrhage.

Charles Zeh Garside, M.D., New York City; College of Physicians and Surgeons in the City of New York, 1903, aged 37, a member of the New York Academy of Medicine, and New York Pathological Society, professor of pathology and bacteriology in Fordham University, New York City, died in the German Hospital, New York City, June 1.

Benjamin U. Jacob, M.D., Waukesha, Wis.; Northwestern University Medical School, Chicago, 1881, aged 66, formerly a Fellow of the American Medical Association, a member of the State Medical Society of Wisconsin, formerly a druggist, and physician to the Wisconsin State Industrial School for Boys, died at his home, May 28, from heart disease.

Alfred King, M.D., Portland, Me.; Medical School of Maine, Brunswick, 1886, aged 54, a Fellow of the American Medical Association and a member of the American Surgical Association, professor of surgery in his alma mater and consulting surgeon to the Maine General Hospital, Portland, died at his home, June 4, from pneumonia.

Moise Lafleur, M.D., New Orleans; Tulane University, New Orleans, 1915, aged 27, ship surgeon on the United Fruit Company's steamer *Suriname,* while engaged in scientific research work on the border between Guatemala and British Honduras, was shot and killed by Guatemalan soldiers.

Edward White Elliott, M.D., Turlock, Calif.; College of Physicians and Surgeons, Keokuk, Iowa, 1897, aged 49, formerly a Fellow of the American Medical Association, a member of the Medical Society of the State of California, died at his home, May 26, from cerebral hemorrhage.

Matta Louisa Berry Longwell, M.D., Wellsboro, Pa.; Woman's Medical College of Pennsylvania, Philadelphia, 1905, aged 36, a Fellow of the American Medical Association, died in the Williamsport Hospital, June 3, from acute nephritis three days after an operation for appendicitis.

Louis F. Laudick, M.D., Lima, Ohio; Medical College of Ohio, Cincinnati, 1890, aged 49, formerly a Fellow of the American Medical Association, a member of the Ohio State Medical Association; at one time health officer of Lima, died in a hospital in Toledo, May 25, from paresis.

M. H. Verpoorten, M.D., Council Bluffs, Iowa; Catholic University, Louvain, Belgium, 1874, aged 68, a Fellow of the American Medical Association, for several years a practitioner and druggist of Laramie, Wyo., died in the Jennie Edmundson Hospital, Council Bluffs, June 2.

William Pitt Cleveland, M D, Fargo, N D, Medical School of Maine, Brunswick, 1879, aged 67, said to have been the first registered medical practitioner in Dakota territory, formerly physician of Caledonia and Traill County, N D, died at his home, May 30

Francis M Rose, M D, Los Angeles, formerly of Faribault, Minn, Starling Medical College, Columbus, Ohio, 1860, aged 74, formerly a Fellow of the American Medical Association, a veteran of the Civil War, died at his home, May 18, from paralysis

David C Stinson, M D, Sioux City, Iowa, College of Physicians and Surgeons, Keokuk, Iowa, 1874, aged 66, for thirty-two years a practitioner and druggist of Dakota County, Neb, died at his home in Sioux City, Iowa, May 25, from malignant disease

Thomas Perrin Kennedy, M D, Union, S C, Tulane University, New Orleans, 1910, aged 30, a member of the South Carolina Medical Association, a specialist on diseases of the eye, ear, nose and throat, died at the home of his father-in-law in Union, May 21

Chapman J French, M D, Huntington, W Va, University of the South, Sewanee, Tenn, 1904, aged about 40, a member of the West Virginia State Medical Association, died suddenly at a hotel in Kenova, W Va, May 31, from cerebral hemorrhage

Thomas J Partlow, M D, Newport News, Va, Medical College of Virginia, Richmond, 1906, aged 33, a Fellow of the American Medical Association, for three terms city health officer of Newport News, died at his home, June 1, from cerebral hemorrhage

Charles Turner Sands, M D, Las Cruces, N M, Jefferson Medical College, 1907, aged 33, a Fellow of the American Medical Association, formerly of Pittsburgh, who went to New Mexico six years ago on account of his health, died at his home, May 14

James S Hanson, M D, Sandusky, Ohio, Detroit College of Medicine and Surgery, 1891, aged 47, a member of the staff of Providence Hospital, Sandusky, a director of the Columbus Mutual Life Insurance Company, died at his home, May 31

George Morris Eckels, M D, Mechanicsburg, Pa, University of Pennsylvania, Philadelphia, 1885, aged 59, a member of the state legislature from Cumberland County in 1891 and 1893, a member of the borough council, died at his home, May 24

Thomas Hamlin Strohecker, M D, Washington, D C, North Carolina Medical College, Charlotte, 1902, aged 63, also a lawyer and clergyman of the Lutheran Church, died in George Washington University Hospital, Washington, D C, June 1

Maurice J Carey, M D, Cleveland, Columbus (Ohio) Medical College, 1882, aged 71, formerly a Fellow of the American Medical Association, a member of the Ohio State Medical Association, died at his home, April 17, from pneumonia

Paul Archibald Gillespie, M D, Winburg, South Africa, University of Toronto, Ont, 1891, formerly of Cannington, Ont, major in the South African Expeditionary Force for some time, died at Winburg, March 24, from bubonic plague

James Stimson, M D, Santa Cruz, Calif, New York University, New York City, 1854, Victoria University, Coburg, Ont, 1855, aged 83, president of the Santa Cruz County Medical Association in 1892, died at his home, May 25

James J Gibson, M D, Athens, R D 11, Lexington, Ky, Hospital College of Medicine, Louisville, Ky, 1889, aged 47, a Fellow of the American Medical Association, died at his home near Athens, May 28, from cerebral hemorrhage

Thomas E Bales, McMinnville, Tenn (license, Tennessee, 1889), aged 54, a Fellow of the American Medical Association, for many years a practitioner of Morristown, Tenn, died at his home, May 24, from pernicious anemia

William Ross Lee, M D, Los Angeles, New York University, New York City, 1890, aged 53, died in the receiving hospital, Los Angeles, May 20, from the effects of morphin, self-administered, it is believed, with suicidal intent

Matthew John Perkins, M D, Spearville, Kan, Trinity Medical College, Toronto, 1903, aged 43, a member of the Kansas Medical Society, founder of the Perkins' Hospital, Spearville, died at his home in that place, June 3

Haakon B Christensen, M D, Los Angeles, University of Denmark, Copenhagen, 1894, aged 35, was accidentally drowned at Venice, Calif, February 27

Leonard G Hain, M D, Shillington, Pa, Jefferson Medical College, 1893, aged 43, coroner of Berks County, also a banker, died in St Joseph's Hospital, Reading, Pa, May 23, after an operation for appendicitis

Samuel P Coffman, M D, Sugar Grove, Ky, Louisville (Ky) Medical College, 1886, aged 58, a member of the Kentucky State Medical Association, died at his home, February 19, from disease of the kidney

Ellet Joseph Wagner, M D, Battle Creek, Mich, Long Island College, Brooklyn, 1878, aged 60, physiologic chemist to the Battle Creek Sanitarium, died in that institution, May 28, from heart disease

Joseph Riddle Gorrell, M D, Newton, Iowa, University of Buffalo, N Y, 1859, aged 79, surgeon of U S Volunteers during the Civil War, died at the home of his daughter in Newton, about May 26

Elizabeth Jane Wiley Corbett, M D, New York City, formerly of San Francisco, University of Michigan, Ann Arbor, 1879, aged 82, died at the Takoma Park Sanitarium, Washington, D C, June 4

Almon L Bennett, M D, Nickerson, Kan, formerly of Greensburg, Kan, Eclectic Medical Institute, Cincinnati, 1889, aged 65, died at his home in Nickerson, April 24, from cerebral hemorrhage

Edwin Wilbur Higbee, M D, Northampton, Mass, University of Vermont, Burlington, 1871, aged 66, for more than forty years a practitioner of Northampton, Mass, died at his home, May 21

Douglas Waterston, M D, Westmount, Montreal, Que, McGill University, Montreal, 1914, aged 26, captain in the Canadian Army Medical Corps, was killed in action in France, May 22

Edward John Ulrich, M D, San Jose, Calif, Homeopathic Hospital College, Cleveland, 1871, aged 83, for several years a clergyman of the Methodist Episcopal Church, died at his home, May 31

Philip Henry Edwards, M D, Newark, N J, New York University, New York City, 1895, aged 43, a member of the Medical Society of New Jersey, died at his home, May 26, from peritonitis

Arthur Scott Reebel, M D, Saranac Lake, N Y, formerly of Youngstown, Ohio, Tufts College Medical School, Boston, 1909, aged 30, died at the home of his parents in Youngstown, May 22

James Turner Sherman, M D, Dorchester, Boston, New York Homeopathic Medical College, 1869, aged 67, died at the home of his daughter in Newport, R I, June 6, from pneumonia

George C Werner, M D, Norwood, Cincinnati, University of Freiburg, Germany, 1888, aged 72, a veteran of the Franco-Prussian War, died at his home, May 31, from heart disease

George Henry Carpenter, M D, Cumberland, Md, University of Maryland, Baltimore, 1868, aged 73, died in the Allegany Hospital of the Sisters of Charity, Cumberland, May 24

Otis Lee Wingate, M D, Albuquerque, N M, formerly of Philadelphia, Jefferson Medical College, 1904, aged 38, died recently at his home in Philadelphia, from tuberculosis

John Luther Duryee, M D, Newark, N J, College of Physicians and Surgeons in the City of New York, 1868, aged 70, died in a sanatorium in Orange, N J, June 1

Fletcher Smith, Dover, Ky (license, Kentucky State Board of Health, forty-one years of practice, 1893), aged 92, died at his home, May 18, from senile debility

Edmund P Thomas, M D, Bowling Green, Ohio, Hahnemann Medical College, Chicago, 1882, aged 62, died at his home, May 18, from erysipelas

Carlton S Shepard, M D, Omaha, Rush Medical College, 1881, aged 64, was killed in an automobile accident near Red Willow, Alta, May 24

Charles Jefferson Stovall, M D, Bowling Green, Ky, Kentucky School of Medicine, Louisville, 1891, aged 61, died at his home, May 25

James Francis Costello, M D, Wollaston, Mass, Tufts College Medical School, Boston, 1913, aged 26, died at his home, May 23

In This Department Appear Reports of the Council on Pharmacy and Chemistry and of the Association Laboratory Together with Other Matter Tending to Aid Intelligent Prescribing and to Oppose Medical Fraud on the Public and on the Profession

THE WINE OF CARDUI SUIT

(*Continued from page 1879*)

May 9, 1916, Afternoon

TESTIMONY OF DR T SOLLMANN (*continued*)

The Court met pursuant to adjournment Dr Torald Sollmann resumed the stand for the defendants

DIRECT EXAMINATION BY MR T J SCOFIELD (*continued*)

VALUE OF ANIMAL EXPERIMENTATION

Q—Doctor you stated that a second method of the investigation of preparations such as Wine of Cardui is by animal experimentation Now will you please explain to the jury what you mean by that and what the value of animal experimentation is in such an investigation? *A*—Experiments on the animals enable one to—

Q—Doctor may I interrupt you just a moment to warn you to keep your voice up so that we can all hear *A*—Experiments on animals enable one to obtain definite information by methods that can be exactly controlled and that are not open to the same sources of error as are clinical experiments or clinical observations Whilst of course the clinical test is the final test of the value of a medicine itself in order to be safe it has to be supplemented—or better preceded by experiments on animals that avoid as I say the errors that are very difficult to avoid in clinical experimentation—or clinical observation.

Q—Now doctor can you illustrate this to the jury in any way? *A*—Yes In the scientific subjects one is only applying the same sort of reasoning of course that one applies in ordinary life. The field of that reasoning is a little different but that is the only difference. The same sort of reasoning applies in the scientific fields of investigation as it does in every day affairs

Now one example that occurs to me in this connection that illustrates very well the difference between the laboratory test and the clinical test, is the way in which the germinating quality of the seed corn can be tested If a farmer buys some seed corn and sows it out in the field and the corn comes up and he cultivates it and he harvests the crop of course he knows that was corn that was sufficiently good—the seed was sufficiently good

That is one way of testing the quality of the corn. And it is rather a wasteful way and it takes a long time and it is not absolutely certain because, if the corn should not come up it might not be the fault of the seed at all the weather might be bad it might have rotted in the ground or some animals might have eaten it up almost anything might have happened.

So that whilst to a certain extent under certain circumstances, that field test which corresponds to the clinical test is a good test under other conditions it is not.

Now there is another way in which the quality of the seed can be tested, and that is to put it on a plate with a little water behind a stove and see after two or three days, whether it has sprouted Now that corresponds to the laboratory test. You are subjecting this corn to rather artificial conditions and not exactly the conditions under which you are going to use it in the field, but simpler conditions conditions that you can control.

If you are doing the test on the plate in the first place you know definitely whether that seed is a good germinating seed or not. If it has not germinated there it would not be the fault of any crows or any bad weather—it was the fault of the seed and nothing else.

Then again the test is very much quicker You don t have to sow it in the field and if it does not come up lose your whole season s work It can be done inside of a very few days Why? Because the conditions for the test are so much more favorable than they are in the field test. Therefore if you are wise you will make that test first, if you have any doubts as to the quality of that seed if you bought it promiscuously—you will first make the seed test before you put it in the field.

Now that is exactly the case with the laboratory experiments The laboratory experiments bear exactly the same relation they are quicker they are more certain they are more certain because you are controlling and you know you are controlling the conditions You can watch that corn all the time. You cannot watch what is happening to it after you put it in the ground you cannot see it.

Then there is another similarity between the two tests and the clinical experiments. That in your plate test—

Mr Hough—In your what?

The Witness—In the plate test, when you put the seed on the plate

Mr Hough—Plate?

The Witness—Yes. If in the plate test that seed does not come up then you are perfectly sure that the seed is not worth while planting it is not any good you can be absolutely sure of that.

Now it is just the same here. If you make under proper conditions animal experiments and you find that the drug has no action on the animals you can be perfectly sure that it has not any action on the human and that really—I mean clinically—and that really, it is not worth while trying it clinically

Further, if you find that your seed germinates that does not necessarily mean that you will have a good crop That is not the only thing that is required to produce a good crop You can put that in the ground—it may sprout, possibly—and then freezing weather may come in and your corn is cut off So, simply the fact that you get a result in your laboratory test — in your plate test, does not mean that you will get a good result from the corn if you plant it

It is just the same in animal experiments. You may find that a drug has an action in an animal experiment. That does not necessarily mean that that would be a useful drug clinically That depends on other conditions. It depends especially upon whether the clinical condition—condition of the patient demands that kind of an action You can see there is that action You can produce it under certain suitable conditions but it does not mean it is a useful drug because you may not want that action—very often you don t.

I think that is perhaps as well as I can make an illustration of the correspondence between the two

ERRORS OF CLINICAL TRIAL

Mr T J Scofield *Q*—Doctor as I understand you it may or may not be that clinical trials are sometimes subject to error Now, will you explain that to the jury or explain what these possible errors are? *A*—Yes Every physician recognizes clearly that his clinical experience has limitations and the conclusions to be drawn from them also have their limitations That has been known since the oldest times in medicine The beautiful Hippocratean oath that was administered by Hippocrates at the beginning of medical history states that 'Experience is fallacious and judgment is difficult'

He stated that because he was an accurate, discriminating clinical observer He observed as well as anybody could observe with the means that were possible at that date. He was one of the best observers that has ever been in medicine And that was the result — that was the conclusion that he arrived at from his clinical experience

Now the reason why he arrived at this conclusion was this — there are several reasons in fact The first is that the course of a disease is uncertain In many cases you cannot predict how the patient will be the next day and if you cannot predict how the patient will be the next day — if he is different tomorrow from what he was today and you have done something in the meanwhile, you do not know necessarily that that was due to what you did or due to change in the patient himself In other words the fact that you give a drug to a patient and that a certain result follows in a given time, does not necessarily mean that that result was due to that drug that you gave It might have been due to something entirely different

Now let me give you an illustration of that. Take pneumonia. Pneumonia is a disease that runs a perfectly definite course We know that. A patient gets a high fever gets sometimes out of his head he gets worse and worse for about for or five days At the end of that five days a sudden change occurs he either dies, or he gets well by himself practically without any treatment Before people fully realized that — they now know it most of them well enough — but before they realized that they used to be giving all kinds of drugs in the treatment of pneumonia drugs and other things baths and all sorts of things They would give those and the patient would go on, and after the five days a certain number would get well and a great many people attributed that to this drug or that, or something else

It has been now shown had they left those patients strictly alone they would have gone through exactly the same course of events It simply shows what the natural course of the disease is Now in the case of pneumonia we know that well enough now That is one of the few diseases — many infectious diseases are the same way they run an absolutely definite course, and we know what is going to happen Take a patient who is bleeding from a large artery Suppose you cut the artery in the hand and let the patient bleed. Now one of two things is going to happen and you don t know which it is either the patient will bleed, or the bleeding will stop it will be one or the other eventually You give a drug between the times and the patient stops bleeding but you cannot tell from that that it was the action of the drug He might have stopped anyhow — or he must have bled to death

Now all those things are along that same line Now that is one great source of error — I should say the most frequent source of error that a man physician or patient or the laity — if they are sick they use a drug and if they get well they conclude from that that they got well because they took that medicine That may be so but it need not be so It takes more accurate more careful methods of observation that will definitely fix the drug as the thing which did the trick—did the business

Another difficulty in the — a— source of error in clinical observation is the effect of suggestion Now a man or a woman differs from animals in the fact that they reason — at least they have very much more reason — and therefore they can be made to imagine things and if those things are sufficiently impressed on their imagination they are very likely to happen

If you take an individual who has been sleepless and has not slept well for some time and you tell him very emphatically That is all right, I know the reason for all that to-night I know those reasons are going to be removed, and you are going to go to sleep to-night all right and will have a sound sleep — very likely he will have that sound sleep no matter what else you do If an individual has a pain and you can only convince him distract his attention from that pain by occupying it with something else that pain will disappear Everybody knows the old trick of biting the bullet when you have pain Now the bullet has no effect on that pain It does not remove the pain it distracts the attention.

Now, all that sort of thing comes in when one gives a drug to the patient The effect may be due simply to suggestion That has to be guarded against That is very difficult

Another source of error is that very often that several things are varying in the treatment The physician prescribes a drug, and together with the drug he prescribes a lot of other things. He tells the patient to go to bed, to remain quiet, to eat certain food and not eat certain food Sometimes he gives them a mixture of medicines Now when all these things come together, of course, it is impossible practically to tell by ordinary observation what part the drug may have played in the effect, and what part it may not have played in the effect

Now, all these sources of error — and there are some more that I do not think of at the moment — now, all these sources of error can be, to a large extent, counteracted or prevented by very careful, discriminating observation, observation that goes down into every detail, and which makes the conditions just as constant as they possibly can be, methods of observation that practically can only be carried out in hospitals, where the means of observation are such as will allow of that kind of experimentation

But the ordinary observation is exposed to large sources of error, which must be taken into account when one draws any conclusion from them, and which do not occur in animal experiments, because, in animal experiments, in the first place, you are working for a short time and you know that in that time, if the experiment is properly conducted, no spontaneous changes occur, and the animal's condition is absolutely constant The only variation that occurs there is the introduction of the drug

Therefore, since that is the only change that occurs — if a change occurs — in the animal, it must have been due to that drug, and cannot have been due to anything else

Then in animals, again, you can introduce very much larger doses than you can in the human Therefore, an effect which is so slight in the human that you cannot be sure it is an effect — so slight that you cannot decide 'Did something really happen, or didn't it happen?" In animals you can use enough so that you can be sure that something happens If nothing happens with these large doses, certainly nothing could have happened with the small doses

Further, in animals, besides excluding the element of suggestion I have already mentioned you can introduce a drug in a better way You can introduce it, if necessary, directly into the tissue, where it will act Now, if you give a drug to a human individual, it may happen that that drug is not absorbed at all It has first to be absorbed It has to go through all the tissues, and part of it is excreted in that time You do not know, unless you can determine it directly, how much of that drug will reach any given organ

Now, if you can take an animal, or under certain conditions, a human individual — but you cannot do it as often with humans as you can with animals — and introduce that drug directly into the circulation, or, still better, into the organ that you are studying, you know it is there, and it is there in the doses — the best concentration — the largest and most favorable condition that you can possibly place that drug in for the effect

There is still another reason why animal experimentations are in certain directions superior Often you cannot be sure of the action of a drug because it produces several actions at the same time It acts on different things, and those different things interact, and you get a very complicated picture, out of which you can get but very little In such a case, to know that an action occurs, or, still more, to know what that action is, you have got to separate out the tissues, and to do that, you have to do physiological procedures, operations, etc, that you can do perfectly well on an anesthetized animal, but that, of course, you could not do on a human individual

In order to understand the action of a drug, the mechanism of the action of a drug, in other words, in order to really investigate the drug, you must use animal experiments

That, I think, covers the substance of your question

RELATION OF RESULTS ON ANIMAL TO EFFECTS IN HUMAN

Q—Now, Doctor, can the results of animal experimentation be transferred to the human being? *A*—Yes, they can If the structure and the functions of the animal are the same as that of the human in the respects which you are investigating — if they are the same as in the human, the results can be transferred directly to the human, except, of course, the matter of dosage which differs in different animals, and differs as far as — so far as the effect, the action is concerned, that can be transferred directly, if the structure and the function of the organs are the same If they are not the same, of course, one has to choose a suitable animal that has the same structure or function, or one has to take a larger series of animals, etc It can be transferred either directly or indirectly, and if the function and structures are the same, they can be transferred directly from the animal to the human

Q—Doctor, are the actions of drugs the same in health and in disease? *A*—Yes, the actions of drugs are the same in health as they are in disease The effects, of course, may be different They differ to some extent with conditions, the conditions that the action of the drug encounters — the actions are the same

Q—If a drug has no action on the normal animal, can it have any action, or does it have any action on the human disease, or any effect on human disease? *A*—An instance in which a drug has no action on the healthy animals and has an action, demonstrable action, definite action, on the human, is not known No such instance is known, and, furthermore, it is not only unknown, but it is inconceivable

Q—Why is it inconceivable? *A*—Drugs act by affecting the chemical components of the body That is the way in which drugs finally act Now, the chemical components of the body are so nearly related in animals and in men, in health and in disease, that it is just as inconceivable—just as impossible to conceive that a drug would act in the one case and have no action at all in the other case, as it is impossible to conceive that fire would burn pine wood and would not burn oak wood It does not burn them with the same velocity They don't burn as quickly, one as the other, but they both burn They don't burn as fast, because their chemical structure, and their physical structure is a little different, but they both burn, because their chemical structure is alike The drug acts on the body essentially in the same way as the fire acts on the wood Now, you can take your oak wood or your pine wood, and you can let it rot, then it is still there—it will still burn There is no difference in that the action is the same, and it is just as impossible to conceive of the one as it is to conceive of the other

BY MOUTH OR BY INJECTION

Q—Doctor, is there any drug which produces an effect or action when given by the mouth, which does not produce an effect when injected directly into the tissues? *A*—There is no soluble drug which has that characteristic, namely, that it produces—that is the question—it produces an action when taken by mouth and not an action when it is injected into the system That also is inconceivable, because, when you inject a drug into the system, it comes directly into contact with the tissues, much more directly than when you take it by mouth when, in the first place, it slowly absorbs, instead of entering quickly, and, in the second place, it is excreted all the time You never get as much at the time in the tissues

My answer was—the question, as I understand it—was any action on the system Of course, a drug will produce an action in the alimentary canal better when it is given by mouth, when it comes in contact with the alimentary canal, than when it is injected into the system That is a local action But an action on the system—you cannot conceive of it being easier to produce that, when the drug is given by mouth, than when it is injected into the system—speaking of soluble drugs

Now, if you take the case of insoluble drugs, the condition may be different Certain drugs may require for their solution that they should be digested, as it were Then, of course, that is a different thing altogether Then they will not act unless they are digested But substances that are soluble will invariably, almost invariably, produce a greater action, or better action, if they are injected directly into the system, than when they are introduced indirectly by way of the alimentary canal

Q—Now, Doctor, Wine of Cardui is sold as a female remedy, claimed to be a female tonic, a uterine tonic acting on the portal system acting on the womanly organs, just as a kidney remedy acts on the kidneys, curative in all sorts of menstrual disturbances, displacements of the uterus, inflammations of the uterus, gonorrheal vaginitis, sterility Will you explain, if you have an opinion on the subject, how animal experimentation might throw any light on these claims? *A*—These claims relate entirely to the female generative organs They presuppose, as you state them, an action on the uterus Now, effects on the uterus can be very well investigated in animals, perfectly well, and they—

Q—Well Doctor — go ahead Answer *A*—They can be investigated, in the first place, by an action of the blood supply on the uterus or an action of the contractions of the uterus, all these claims practically come back to those two things, an action either on the blood supply or on the contractions of the uterus, and both these things can be perfectly well investigated in animals, with very definite results, or absence of results, as the case may be.

Q—Well, what bearing has the blood supply of the uterus on these claims? *A*—The blood supply of the uterus determines the blood flow to the uterus, and, therefore, would very markedly influence such female disturbances as amenorrhea, and menorrhagia and metrorrhagia All these would be influenced, and would, to a certain degree, depend upon the blood supply of the uterus

Q—How may the blood supply of the uterus be varied, and how can this be shown by animal experimentation? *A*—The blood supply of the uterus may be varied in several different ways It may be varied in the first place by an action on the blood vessels, either directly on the blood vessels or through the central nervous system That can be determined by the blood pressure and also by the color of the uterus. The more blood there is flowing through the uterus, the deeper the color of the uterus

The second way in which the blood supply of the uterus may be affected is somewhat indirectly, through congestion of the intestines and perhaps also through congestion of the portal circulation, that is to say, the circulation of the liver In intestinal congestion, or portal congestion any such congestion would also be shown definitely by changes in the blood pressure and by changes in the color of the intestines

Furthermore anything or most things or many things that alter the blood supply of the intestines do so by irritating the intestines and that means that the intestines will move more, so by watching the intestines one obtains further light on that subject.

Another way in which the drug may act or influence the blood supply of the uterus is by acting on the muscles of the uterus itself — the uterus itself The uterus is a muscular organ and consists of what is called smooth muscles or muscular fibers and between these fibers, or certain ones of these fibers, run the blood vessels

If these fibers contract together that compresses the blood vessels and that is the way in which ergot acts after childbirth When the uterus is large and the woman is bleeding a good deal, all you have to do to stop the bleeding is to contract the uterus down so that the fibers press on the blood vessels and squeeze them together

Now an action of that kind would be shown by increased contraction of the uterus The contractions of the uterus can be increased That also can be very imminently and easily shown by animal experiments.

Q—Now then doctor assume it to be a fact that Wine of Cardui has no effect on the blood pressure even when it is injected into a vein in large doses. Assume further that neither Wine of Cardui nor viburnum prunifolium the bark of the stem or of the root has any effect on the blood pressure, nor on the uterine contractions the color nor on the intestinal contractions or color

Assume further that Wine of Cardui viburnum prunifolium and carduus benedictus and marianus have no effect on the contractions of the excised human uterus both the alcoholic and the evaporated preparations being used

Assume further that in the animal experiments the drugs were given by mouth under the skin and into the intestines

Assume further that Wine of Cardui when injected into the human uterus in the living subject, produces no effects of any kind

With these assumptions in your mind have you an opinion as to the effect of Wine of Cardui in menstrual disorders? *A*—Yes I have an opinion.

Q—Wine of Cardui and the other drugs which I have named Have you an opinion? *A*—You have in your question covered all the ways in which I can imagine a drug as affecting the blood flow of the uterus You have in your question given these not only in the best possible method, but you have also given them by practically many essential modifications of the method or kinds of methods of administration.

You state that under those conditions it produced no effects of any kind in any of these contractions. The only conclusion that I can draw from that is that it would not affect the menstrual flow

Q—Could it be possible in your opinion that a drug might act on the blood flow in diseased conditions of the human being and have no effect on healthy animals? *A*—No that is quite inconceivable. The structure and functions and the distribution of the blood vessels are the same in the human and in animals and therefore it would be quite impossible to make such an assumption.

MENSTRUAL DISORDERS

Q—Doctor are there any other ways in which a remedy might affect menstrual disorders than acting on the blood supply of the uterus? *A*—Oh yes. It might act upon the cause of those disorders

Q—Now when you say the cause of the disorders do you mean the cause which produces the trouble or disorders? *A*—Yes take tuberculosis and that sort of thing anemia.

Q—Now Doctor would tonics be of any value in menstrual disorders? *A*—So far as the menstrual disorder proper is concerned, they would be of no direct value. They might be of some use after the cause of the disorder has been removed They might be of some use then by hastening the recovery of the patient, restoring her perhaps somewhat more rapidly in her general health But, so far as the menstrual condition is concerned, they would have no effect on the menstrual disorders in the way in which I have mentioned here

Q—What is meant by tonic? *A*—A tonic is a measure that increases the nutrition and vigor of the body at large. If you are using the term simply as a tonic, that is what it does.

As a matter of fact the word 'tonic is used in two quite different ways according to whether you speak of the body at large, or of a muscular organ in particular

The meaning when we speak of a general tonic, or a tonic without qualification is the definition that I just gave something that increases the health and vigor of the body at large. The best example of that to make my meaning clear clearer than anything else the best typical tonics are proper rest and exercise, proper food outdoor air, sunshine and things of that kind and when they are indicated such drugs as iron and arsenic. That is what we mean by a general tonic.

Now in the case of a muscular organ when we speak of a tonic acting on a muscular organ particularly then we mean a drug that produces increased contraction of that muscle. For instance a heart tonic would be a tonic that increases and strengthens the contractions of the heart A uterine tonic that is a muscular organ would be a drug that strengthens the contractions of the uterus There are those distinct two meanings a general tonic and a muscular tonic.

BITTERS

Q—Doctor are carduus benedictus and viburnum prunifolium tonics? *A*—Both of those drugs are bitters and bitter substances generally are believed by some to act under certain conditions as tonics by improving the appetite and improving digestion

Q—Are the bitters contained in carduus benedictus and viburnum prunifolium superior to other bitters? *A*—Whatever action is produced by bitters in that way is owing solely to their bitter taste and only to their bitter taste. Therefore one bitter is no better than another bitter The only point is are they bitter or are they not bitter? One bitter is as good as any other

Q—How do the bitter substances act as tonics in what way? *A*—That is not accurately known and in fact there is considerable reason to doubt whether they do act in that way or whether they don't act in that way They have had a good deal of — considerable reputation since the oldest days of medicine, and before that probably for improving the appetite and improving digestion and in that way indirectly improving the nutrition.

Q—Is there any scientific evidence for such action doctor? *A*—Experiments have been made quite extensively to determine whether that action is possible that action that is popularly assumed and stated to exist — whether it actually exists

There has been a great deal of difference of opinion as to whether it actually exists or not and a great deal of experimentation has been done about it

The earlier literature in regard to that the earlier statements and the earlier experiments generally are rather contradictory on that point The latest work that has been done upon it — the earlier works, some say that they have and some not

The latest work that has been done on that subject is by far the best that has been done It shows conclusively, to my mind at least that the bitters have no effect in increasing the appetite or increasing the digestion or any functions of digestion in normal animals or in normal man

Therefore, if the actions occur at all, they must occur only under special conditions and those conditions have not been investigated

There has been only one piece of work done on that particular subject and that has been done on extremely anemic animals, animals that were bled several times and reduced to a degree of extreme anemia Those animals when they received bitters, did show a slight effect Their appetite did not become normal or anything like normal Their digestion did not become normal or anything like normal, but it did improve a very very little

Now that is the only positive evidence for the value of such tonics taking all the work into consideration I mean the only one that is really conclusive work.

Now as to how they act, as I said before, every one is agreed that the action is simply through or is connected with the bitter taste in some way or other if it occurs at all.

I have always thought that one possibility of the contradictory results was this it is a peculiar fact that everybody has observed who has paid any attention to bitter tonics, it is a peculiar fact that they only act when they are taken half an hour or so before meals If they are taken at any old time in the day, they do not act as tonics Nobody has claimed that they act as tonics then Everybody who has any acquaintance with the subject says that they must be taken at that particular time

Now it has always appeared to me that one possible explanation of the thing was this the function of the stomach depends to a great extent upon one's eagerness to receive food. If you simply suggest to an individual, or even an animal by showing it meat (a dog for instance) that he is going to be fed, then his digestive juices begin to flow

Now it seemed to me that probably the action of the bitters simply consisted in sort of a bitter dinner bell The suggestion is that bitter and half an hour after that he knows he is going to get his dinner and under those circumstances the chemical juices start to flowing just as if you hold a piece of meat before a dog and the dog knows that in half an hour from that he is going to get his meal If you do that with a dog if you show him the meat and he is accustomed to it that means to him that pretty soon it is feeding time and then his juices begin to flow Now I rather think that that is the way the bitters act but there is no positive work on that subject

Q—Then it is your opinion if I understand you that a medicinal solution directed to be taken three or four times a day, without reference to meals would not be a bitter tonic? *A*—Not unless it happened to be taken by accident at this particular time and it must be taken regularly That is another thing about tonics they must be taken regularly If they are going to produce any action you must train your patient to accept that fact.

UTERINE TONICS

Q—What is your opinion, Doctor as to the value of bitters as tonics in uterine displacements and disorders, or uterine diseases I should say? *A*—They would have no effect on the uterine disease as such of course

Q—You spoke of the investigation of uterine movements What light would they throw upon the value of a preparation that is claimed to be a uterine tonic to take in the slack of the muscles and nerves and have a sedative action on the uterus and act upon the womb itself to help pull up and replace the womb in its proper position? *A*—The claims that you state there appear pretty inclusive, and it would be pretty difficult to imagine a drug that would have all of those actions at the same time. But if any of those actions did exist, they could undoubtedly be shown definitely by experiments on animals in which the uterine movements can be directly watched and recorded

Q—Doctor define what you mean by a uterine tonic, stimulant and sedative? *A*—A uterine tonic is a drug that contracts the uterus down causes it to go into a more tonic state as it is called makes it more firm, makes the muscle contract more firmly

A uterine stimulant is one that increases or heightens the contractions the contractions go up and down and it will go up higher and perhaps make them more frequent. It increases the individual contractions whereas the tonic has more or less permanent reactions

A uterine sedative or uterine depressant as it is sometimes called weakens the contractions of the uterus, so that instead of being this way they will be only slight, or only very slow (The witness apparently indicates with his hand without the sight of the reporter)

Q—Are the contractions of the uterus susceptible to the action of drugs? *A*—Oh very strongly so yes

Q—How can these actions be investigated? *A*—They can be best investigated on the animals. One can take a living animal, anesthetize it of course, and under a bath of warm saline solution so that it does not get irritated by the air attach a thread to one end of the uterus and let that go up to a lever and tie it to one end and each contraction of the uterus will move that lever and make it write on the recording surface of a cylinder that revolves That is one way

Another way one can get a uterus right out of the body and suspend it in a saline solution that is kept warm and is supplied with oxygen and then tie it to a lever and it will write.

That can be done on the human uterus uteri that have been removed by operation for instance as well as on the uteri of animals

Any of these ways will give a very definite tracing The uterus itself is made to record Nobody is doing anything and it is made *to record its own movements* It does that itself and there records them itself so that the observer or operator does not enter into the thing at all directly

Q—Is the uterus that is excised and taken out of the living subject alive after it is taken out? *A*—Yes, as is shown by its contractions Dead things don't move It is just as alive as a *rain worm when* you cut off the head and it goes on wriggling, just as much alive

Q—Will an excised uterus, a uterus that has been removed from the body, actively respond to the drugs that act clinically on uterine movements? *A*—All the drugs that are known to affect definitely the uterine movements clinically, do produce striking changes in the contraction of the animal uterus after it has been excised, under any of these methods that I have named

Q—Well now, doctor, let me ask you whether or not the uterus *is alike in animals* and in human beings? *A*—The structure is the same, the functions are the same, the nerve supply is generally the same and the blood supply is the same They are the same in every respect except the size and the shape

EFFECT OF DRUGS ON UTERINE CONTRACTIONS

Q—Have you made any experiments yourself on the effect of drugs *on the uterine contractions? A*—Yes, sir

Q—What experiments have you made with Wine of Cardui, and *the fluidextract* of carduus benedictus, if any? *A*—I have made a series of experiments on the excised uterus of a guinea pig and also a series of experiments on the excised human uterus, both with Wine of Cardui, and with fluidextract of cnicus benedictus The fluidextract of cnicus benedictus—I used two samples One was prepared from the drug by the chemical laboratory of the American Medical Association, and the other was the extract marketed by Eli Lilly & Company, the fluidextract of Eli Lilly & Company

Q—Were the uteri that were used in those experiments normal? *A*—I used three human uteri in these particular experiments. One *of these was from a case of cancer The other two uteri were normal* in their structure They had been *removed on account of displace*ments, but their structure was normal

Q—How about the animals that you experimented on, if you experimented on animal uteri? *A*—The guinea pig uteri were strictly normal

Q—Well, did the different uteri and the uterus of the guinea pig —or the uteri, as it may have been—I don't know whether you said *one or more A—Several*

Q—Did they react alike or not? *A*—They reacted exactly the same way, yes I will leave it that way for the present

Q—What was the effect produced by the use of Wine of Cardui in that way? *A*—The Wine of Cardui I employed in concentration, *adding it* to the saline solution that was around the muscle in large quantities as compared with the volume of the muscle, I used that in concentration *ranging from one part of* Wine of Cardui to 1,500 of the solution, and strengthened that in different experiments so I got one part of Wine of Cardui to thirty in some of the experiments of the solution In those various concertrations—that last concentration is much higher than anything you can conceive of, occurring in the actual body—in all of these experiments there was absolutely no effect on the contraction of the uterus, either in the guinea pig or *in the human*

Q—Now, what result did you obtain with the fluidextract of carduus benedictus? *A*—*The fluidextract* of carduus benedictus, I used somewhat the same concentration I used it in the proportion of one to 1,500 up to a concentration of one to sixty seven, that is one part of the drug to sixty seven of the saline There was absolutely no effect

From one to sixty seven on to one to thirty three, if you get above the concentration of one to sixty seven, then you get a progressive *depression of the movements, which was undoubtedly* due to the alcohol in the fluidextract A concentration of one to thirty three would make about 2 per cent of absolute alcohol in the *solution directly* in contact with the drug and permanently in contact with it and such a concentration undoubtedly depresses the contraction of the uterus, being in contact with it.

Q—Doctor, did you make any tracings of these experiments? *A*—Yes sir, I have some *typical tracings* with me that will illustrate the matter

Q—Have you got them with you there? *A*—I have them with me yes

Q—I wish you would produce them, doctor (Papers produced) These are *made* by you? *A*—Those were made by me, yes, sir

Mr T J Scofield—Mr Reporter mark these Defendants' Exhibits 73 and 74

(Papers marked as indicated)

Q—Doctor, will you take these and explain—

Mr Hough—Let me look at them for a moment

Mr T J Scofield—Yes, this is the first one

Q—Doctor, I hand *you now* these exhibits, marked respectively 73 and 74 Will you indicate to the jury or explain what those lines indicate? Explain the tracing, so that they may understand the exhibits *A* (Exhibiting papers to jury)—This first wave line here represents the contractions of the normal human uterus excised

Mr Walker—Are you using 73? *A*—73, yes That was the Wine of Cardui itself This wavy line on each of these tracings *indicates* the contractions of the uterus (Indicating on tracing without the sight of the reporter) Now, at this point here Wine of Cardui was introduced in a concentration of one to 150 and you see this contraction go on, there is *no change* Here the concentration was strengthened to one part to fifty, one part to fifty *and* still the contractions go on without any change Here it was increased to one to thirty, and you see these waves are still present, no stronger and no weaker, nor faster nor slower, just exactly the same

Mr T J Scofield—Now, that Exhibit 73 represents experiments with what? *A*—Wine of Cardui, and *the human uterus.*

Q—Wine of Cardui on the human uterus? *A*—Yes sir Shall I exhibit 74 *now?*

Q—If the gentlemen are satisfied with that.

The Witness—The point is that the waves that are shown on this tracing, which are the normal contraction waves, are *not changed* at *all by* putting in the drugs They continue just as they were before Now, here is the same uterus—

The Court—You are using what?

Mr T J Scofield—Wait till we get through with this one. Now Doctor, will you take Exhibit 74? Judge, do you care to look at that? What is that Exhibit 74? *A*—Exhibit 74 shows the effect of the fluidextract of carduus benedictus on the same uterus.

Q—Explain it to the jury *A*—The same uterus left in the same solution That is to *say*, the Wine of Cardui was left in and then so that it could still act—this fluidextract of carduus benedictus was *added to that.* You see those waves are still the same At that point the fluidextract of carduus benedictus, the Lilly kind was added, one to 150 and it still goes on, *no change.* At that point (indicating on tracing without sight of the reporter) some more was added so as to make a total of 1 67 and it still goes on without any change Now, after that *there is one normal contraction*, but then it gets weaker and here we put in a little more so as to make a total of *one to thirty three, added more to it and there the contraction dis*appeared, ceased altogether

Mr Hough—I suggest that he just pass that around among the jury, and testify so that everybody can hear

Mr T J Scofield—He has a right to explain it

The Court—*Just so long as the reporter gets it all*

Mr Hough—And so that all the jury can see.

Mr T J Scofield—Doctor, you spoke of the Lilly kind What did you mean by that, a preparation from the Lilly Laboratories? *A*—Yes, sir, fluidextract prepared by the firm of Eli Lilly & Company

Mr T J Scofield—If the Court please, I offer Exhibit *73* in evidence, and I also offer Exhibit 74 in evidence. *They are admitted* are they, your *Honor?*

The Court—I think they were pretty effectually in before they were offered

Mr T J Scofield—I thought so, but at the same time I do not want any question about that.

Mr Williams—Oh, we agree to it

Mr Hough—For what it is worth

Mr T J Scofield—You explained *how these tracings were made*, didn't you? *A*—Yes sir, I think so

Q—In a question which I asked you some time ago, I described to you the results obtained in certain other experiments with Wine of Cardui, carduus benedictus, carduus marianus, viburnum prunifolium (the bark of the stem and of the root), in the form of fluidextracts or solutions in 20 per cent of alcohol and evaporated solutions taken up *in water Do you still have these results in mind? A*—Yes.

Q—Now, from those results, together with your own experiments, have you an opinion as to whether any of these drugs *that I have* named have a tonic action or a sedative action, or any other action on the uterus? *A*—They all agree in showing that there is no tonic action, no sedative action and no form of action on the uterus, or uterine contractions under any conditions

Q—*Have you an opinion* as to whether Wine of Cardui could have any effect on the uterus when used according to directions, namely a tablespoonful three or four times a day? *A*—I have an opinion

Q—What is the opinion? *A*—That it could have no effect whatever

Q—Why? *A*—Because the conditions that you named, if it is actually used according to directions, would not be nearly as favorable to producing an action as the experiments that you described, and the *experiments* that I explained So that if there was no effect under these extremely favorable conditions, under the conditions of the directions, a *tablespoonful* three *or four times* a day to a woman, it could not have any effect

Q—Could these drugs, doctor, increase the nutrition *of* the uterus without increasing the uterine contractions? *A*—No The nutrition *of a muscular organ* is increased by drugs only by *exercising* the *muscle of that organ*, but throwing it into contractions, the muscle of the uterus or of the part—it is just like any other muscle You *cannot very much increase* the nutrition of your biceps muscle and make it bigger and stronger, except in one way, and that is by exercising it and *making it contract more* It is exactly the same way with the muscle of the uterus or the heart. The only way you can improve its nutrition is to *make it* contract *more,* by drugs.

Q—Could a uterine tonic or any drug replace a displaced uterus? *A*—No

Q—Why? *A*—A misplaced uterus means a mechanical condition that could only be corrected by mechanical means by *lifting* it again *into place*

Now, while it is true that there are certain ligaments *attached to* the uterus, those *ligaments do not* contain anything that could lift the uterus about They contain, it is true, certain of them—only a few however—contain a very *little muscular* tissue, but that muscular tissue in the round ligament (that is the one which does contain muscle), that muscular tissue is *so small in amount* that it could not lift anything More than that, it does not respond, it does *not* contract even to the stimulation of the most *powerful* drugs that act on the uterus, that muscle does not contract at all So any way we look at it, there is no way in which a drug could *replace* a displaced uterus. *It is* a *mechanical* impossibility

EMPIRICAL AND SCIENTIFIC MEDICINE

Q—What is the difference between empirical and scientific medicine? *A*—It depends on the way in which you use the term "empirical." Empirical really means based on experience. Now all medicine is based on experience Scientific medicine is based on experience and on experiments so that there should be if one properly uses the terms there should be no difference between empirical medicine and scientific medicine

Very commonly however the term 'empirical medicine' is applied rather slurringly to superficial slovenly observation observations that are not thorough and scientific medicine' is applied to medicine that is thorough medicine, that takes into account chemistry and pharmacology clinical observations and the whole range of medical science It is simply a question of whether one is as thorough as you can make it or whether it makes no attempt at thoroughness. That is the way the term empirical is sometimes employed.

DRUGS IN COMBINATION

Q—Doctor if two drugs are given together, does that influence the action of each of the drugs? *A*—Oh yes it may be influenced in several different ways It may influence it by simply adding the action of one drug to the action of the other drug You take a drug that acts in one direction and another drug that also acts in the same direction and you give them together and you may get twice as *much action* as you get *from* either one alone

Or again, you give a drug that acts in one direction and another drug that acts in the opposite direction, and you give them together and they may neutralize each other and there may be no effect simply by adding the action of one to the action of the other That is simple addition. That is by far the most common way in which the drugs influence the action of each other simple addition

Then in a few instances relatively a curious thing happens. If you give one drug with another drug you may produce a greater action than you would have produced with either drug alone a greater action than with either drug alone, even if you doubled the dose. Take one drug and if you gave twice as much of that drug you don t produce as much action as if you give that drug with another drug That is what is called synergism.

Then there is another proposition You give one drug to produce a certain action and you give another drug and you find that the action is less than the simple addition of the two actions That also occurs sometimes

You have the simple addition. In fact you may get the simple plus or minus, or you may get a greater effect than you would expect, or you may get a smaller effect than you would expect.

The most common way all things taken into consideration, is as I say simple addition and that is what one expects to happen until one has direct confirmation that something else does happen One is not justified in assuming synergism unless one has actually demonstrated that there is synergism and until one has demonstrated it you must not assume it There is no general rule which applies It is a matter that has to be determined in every individual instance.

Q—Assume that Wine of Cardui contains caramel Will you tell the jury what caramel is. *A*—Caramel is burnt sugar The sugar has been heated until it has burnt to a certain degree and gotten brown or black.

Q—Is it known to have any medicinal action? *A*—No it is not It is simply used as coloring matter

USE OF ALCOHOL

Q—Wine of Cardui contains 20 per cent. alcohol It is advised to be taken three or four times a day in tablespoonful doses, each dose corresponding to 48 drops of pure alcohol Have you an opinion as to the effect of these doses of alcohol on female diseases? *A*—Yes.

Q—What is it, doctor? *A*—It would be essentially the exhilarating and narcotic effect of the alcohol.

Q—Would that action be of any benefit whatever to the female? *A*—It certainly would not tend in any way to cure those various female disorders It might make the patient feel better it might exhilarate them and give them temporary relief but it would not in any case improve the conditions of course.

Q—Would the character of relief which you say it might give, would that tend to cure the disorders? *A*—Not at all

Q—Have you an opinion as to the general advisability of using alcohol in female diseases? *A*—As a general *proposition* I would consider it inadvisable

Q—Why not, doctor why is it inadvisable? *A*—I would consider it inadvisable because if you produce an exhilaration or relief in that way you are not doing the patient any good and you may do the patient considerable harm

There are many ways in which it may do harm habit formation and all that sort of thing but it may do harm a little more directly in this way the patient feels relief The result is that she may not get the treatment that is really needed for the condition. The result of that would be that that condition would get worse naturally or it might get worse, and in that way relief that could be obtained would not be obtained the real relief and in that way the condition might become incurable. So besides from the deleterious effects of the alcohol as such which would be taken into consideration it might have a deleterious effect in this other indirect way by leading to the neglect of the proper treatment by making the patient feel that she has been relieved when as a matter of fact, she has not been relieved

Q—What is the effect if you know of alcohol on the absorption of drugs? *A*—The effect of alcohol on the absorption of drugs varies undoubtedly with conditions It used to be the belief that certain concentrations of alcohol diluted alcohol in other words increased absorption. That belief was based on the experimental evidence on a very few conditions and on a very few drugs.

Subsequent work has shown that, under other conditions and conditions which approach more nearly to the natural—that under other conditions the effect of alcohol is rather to hinder the absorption of drugs

In other words the effect on absorption cannot be predicted It has to be observed actually by experiments and unless these experiments have been made in a particular connection it would be quite unwise to predict what the effect of alcohol on absorption in that connection would be

Q—Doctor, would the alcohol in Wine of Cardui act just like its equivalent in whisky? *A*—The effect on the system of stimulating and the narcotic action, would be just the same. They would be indistinguishable

Q—Would its use strictly, according to directions, three or four tablespoonfuls a day produce the effect of alcoholic stimulation? *A*—Yes depending, of course, on the susceptibility of the individual

Q—Is it correct that a preparation containing 20 per cent of alcohol is non intoxicating? *A*—No, that would not be correct

Q—Is it correct, in your opinion to say that it contains no habit forming drug? Is it correct in your opinion to say that Wine of Cardui contains no habit forming drug, assuming that it contains 20 per cent of alcohol? *A*—In view of the wide prevalence of the alcoholic habit, that is certainly incorrect

Q—Assume doctor that an entire bottle of Wine of Cardui has been taken without producing nausea, or vomiting diarrhea or any other effects other than those of alcohol Assume also that Wine of Cardui contains in a tablespoonful approximately the extractives from 30 grains of cnicus benedictus and of approximately three grains of viburnum prunifolium extracted with 20 per cent alcohol Bearing all this in mind have you an opinion as to whether Wine of Cardui contains anything that would prevent its use as an intoxicant, tipple or booze? *A*—It contains nothing that would prevent its use as an intoxicant tipple or booze

Q—Is ordinary alcohol destroyed in the body? *A*—Yes sir

Q—To what per cent, doctor, do you know? *A*—Something like 90 to 98 per cent is oxidized in the body to water and carbon dioxid It is burnt

Q—Does this oxidization prevent the alcohol from producing its actions alcoholic actions? *A*—No If it prevented the alcohol from producing its alcoholic action, then one could never get an effect *from* alcohol at all under any circumstances. The fact that one can get drunk on alcohol shows conclusively that the oxidation of it does not prevent it from acting The explanation of that is that the action *of alcohol* occurs almost at once Its oxidation is a slow process In other words a person becomes drunk before the alcohol is burned up

Q—Does the rate or degree of oxidation depend upon the dose and concentration of the alcohol? *A*—To a slight degree on the dose not at all on the concentration In any case the greater part is burnt up the greater part of the alcohol is burnt up anyway

Q—What becomes of the per cent of alcohol that is not oxidized in the system? *A*—That is excreted by the lungs and by the kidneys

Q—Would the stimulant and narcotic action of 48 drops *of alcohol* be greater or less if it is given in 20 per cent or in 55 per cent dilution? *A*—It would be indistinguishable just as the narcotic and stimulant effect of the same dose of alcohol is indistinguishable whether it is given in the form of whisky, or in the form of beer

Q—Is alcohol a common constituent of official drugs? *A*—It is a constituent of certain fluid preparations the spirits and tinctures and elixirs and fluidextracts It is not a constituent of other fluid *preparations*, glycerites emulsions syrups—those are all that I think of at the moment.

Q—Infusions? *A*—Infusions and decoctions yes sir There is one infusion—I may make an exception—there is one *infusion* which at present contains a small percentage of alcohol Otherwise they do not contain alcohol.

Q—Does the solid extract or solid drug contain any *alcohol?* *A*—The solid drugs of course do not alcohol being a liquid

Q—Now are these various preparations that you have just referred to as containing alcohol are they prescribed by physicians? *A*—Oh yes

Q—Do the same objections hold for the official alcoholic *preparations* as for Wine of Cardui? *A*—In a way they do and in a way they do not. It depends altogether on the conditions If the official preparations are advertised like the proprietary preparations, if they are bought like the proprietary preparations indiscriminately over the counter if they are used without fully taking into account the alcoholic effects then the presence of alcohol in them is of course just as objectionable as it is in the case of proprietary preparations

If on the other hand they are not used by the public in the same way or if they are prescribed under certain conditions *by physicians* namely where the physician knows the patient and knows what the patient is and what the effect is he wants to produce, takes the effect of the alcohol into account, where he uses the preparation over a limited time only and where he uses the preparation the dose of which cannot be spontaneously increased by the patient because it contains active ingredients—where several or all of these factors obtain at the same time, then evidently the same objections do not hold to the official preparation as do to the proprietary medicines that are not protected in these various ways.

Q—Assume doctor that the following United States Pharmacopeia preparations contain more alcohol per dose than does Wine of Cardui

Spirit of anise
Tincture of sweet orange peel
Spirit of juniper compound
Tincture cimicifuga
Wine of coca
Tincture of nut galls
Paregoric

How does the prescribing of these compare with the use of Wine of Cardui? *A*—The first two preparations you mentioned were spirits of anise and *spirits of orange* These preparations are used principally for flavoring, and in very small amounts, and contain much less alcohol of course than the 48 drops, because there are *only 2 or* 3 drops used It is only under comparatively rare conditions that they are used in the full dosage, *namely in cases of colic and things of* that kind In those cases, in the first place, they are only used for a short time They *are only intended to be used while the colic* lasts, and everybody knows that colic does not last more than a *day or two usually*

In the second place, it is the action of the alcohol that is there that is a part of the desired action Alcohol relieves colic. There are two distinctions, one is that they are only used for a short time and the other is that they are used in such small quantities

The next preparation you mentioned, I believe, was compound *spirit* of juniper?

Q—Yes, that *is right* *A*—That is *practically* gin, and when it is used, it is used with a full realization that it contains alcohol and it is used under conditions where the alcohol plays a part in its action

Q—Tincture of cimicifuga is the next one *A*—Tincture of cimicifuga is a typical stomach bitter It again is used partly for the effect of the alcohol that is in it In other words, the alcohol there contributes to the effect It is used in certain types of indigestion, and in certain types of indigestion, the alcohol helps as a sort of counter irritant It irritates, just like a liniment helps a little sprain

Q—*Wine of* coca *is the next one I mentioned* *A*—Wine of coca was used to a small extent by physicians, mainly for its alcoholic stimulant. It is really a form of alcohol just like a form of wine, and when one uses Wine of coca, one uses it partly for the alcoholic effect, and partly for the stimulating effect of the cocain that is in it I *personally* have *never known of a physician* that ever *prescribed* Wine of coca, and it is being dropped from the pending edition of the United States *Pharmacopeia* as an undesirable article

Q—It is being dropped *from* the pending *edition* of the United States Pharmacopeia You mean the edition that is coming from the press? *A*—The edition that is coming from the press, yes sir

Q—I next mentioned tincture of nut galls, doctor *A*—Tincture of nut galls is used as an astringent in diarrhea *Of course it would only* be used for a short time Furthermore the very astringent that is there would preclude its use as a beverage in larger doses than the ones that I indicated practically If it were tried in a large dose it would interfere with the patient's bowels, and they would become so locked up, that he would have to leave it *off* in a very short time The last preparation, if I recall it, was paregoric?

Q—Yes *A*—Paregoric contains *alcohol, opium and camphor Those* are the essential constituents It contains several others besides It is used in colic and diarrhea, usually for the opium effect and that very opium effect would preclude its abuse in larger amounts, except by morphin habitues, of course

Q—Now, doctor, assume *it to be a fact that panopepton* contains more alcohol per dose, than does Wine of Cardui How does the prescribing of this *preparation* compare with the use of Wine of Cardui? *A*—Panopepton is a proprietary preparation It is practically an alcoholic food preparation That is to say, it contains certain soluble food elements, sugar and digested meat, and that sort of thing, and alcohol It is prescribed usually during convalescence, sometimes *in fevers* When it is so prescribed, the alcohol plays a very distinct part in its action It acts under those conditions, partly as a food and *partly as a sedative* and an exhilarant Here again, the alcoholic action is a desired element, when it is prescribed It is not simply an accident *that creeps* in but it is considered, or should be considered, when it is prescribed Certainly it produces a positive part of the effect

Q—How does the dose of alcohol in tincture of iron, quinin and strychnin compare with the alcohol in Wine of Cardui? *A*—The elixir of iron, quinin and strychnin, like most other elixirs, contains about 25 per cent alcohol The dose of quinin, iron and strychnin is a teaspoonful, so that the dose of alcohol never would approximate 15 drops per dose as compared with the 48 drops you are asking me to assume in the *Wine of Cardui* The alcohol per dose would be about 15 drops

Q—Does it contain anything to prevent *its excessive use?* *A*—Oh, yes it contains *the strychnin*

Q—The strychnin you say? *A*—Yes

COUNCIL ON PHARMACY AND CHEMISTRY

Q—Doctor, you *state* that you are a member of the Council on Pharmacy and Chemistry of the American Medical Association? *A*—Yes, I have been since *its foundation*

Q—What are the functions of this Council? *A*—The Council was founded by the trustees of the *American Medical* Association I think in 1905, about 11 years ago, anyway, with the purpose of investigating the drugs that are prescribed by *physicians, particularly* I mean the *proprietary*, as distinguished from the official drugs and of informing the medical profession as to what it could find out *about these* drugs the medical profession as to what it could find out about these drugs the medical profession as to what it could find out *about these* drugs

That was *and* is the purpose of the Council on Pharmacy and Chem istry, to collect and publish information about the drugs that are pre scribed, proprietary drugs *or* unofficial drugs, rather—*that is* the exact definition, unofficial drugs that are prescribed or offered to be pre scribed by physicians

Q—What was the *occasion* of this foundation, doctor? *A*—As I understood it, the occasion of the foundation of the Council was a desire *of* the trustees of the American Medical Association to be informed regarding the remedies that sought advertising space in The Journal of the American Medical Association

Before that time, The Journal tried to pass judgment *itself on* the character of the numerous *preparations* that are submitted to its advertising pages, and it found that that did *not* work out very well Very often it was caught

It *therefore found that* job was too large for it to handle, and therefore appointed a body of men who would make a special study *of this subject of unofficial* drugs and left the judgment of these drugs and the investigation of them to this council That was the occasion *of it*

The object into which it finally developed was not confined to The Journal at all, but to informing the profession in general as to what it could find out about the preparations that physicians were using

Q—Doctor, what is the book known as New and Nonofficial Remedies? *A*—That is an annual publication of this Council on Pharmacy and Chemistry It contains the descriptions of the articles that have been accepted by *this Council, investigated* and found on the whole worth while

Q—*What determines* the admission of a preparation to this book? *A*—That is determined by whether *the article* complies with the established and printed *rules* of the Council for the admission of the articles?

Q—What is the object of those rules? *A*—The object of those rules is that the full truth, and nothing but the truth be told about an article that physicians are asked to use

Q—Are secret *remedies* admitted? *A*—Secret remedies are not admitted, that is to say, remedies the composition of which is not known, are not admitted, *they are not admitted to this book*.

Q—Now, why is this restriction made, doctor? *A*—That restriction is made because *no physician, with full understanding*, prescribes a medicine unless he can find out about its composition. If he cannot *find out about its composition*, he lays himself, or rather he lays his patient open to numerous dangers

In the first place, he cannot use the drug itself intelligently, if he *does not know what it is In the second place*, he is apt to make very dangerous combinations if he does not know what is in the drug He may add some drug to this mixture that he prescribes, that is in the mixture itself He may thereby increase the dose. He may increase it above the safe limits, or he may add strength to it—he may add something to it not knowing what is in it, that interferes one with the other and he does not get the desired *effect* in that case, without the medicine being at all at fault.

Then again it is a well known fact that quite a large number of people have peculiar susceptibilities to drugs which a physician must guard *himself* against—towards *special* drugs—that a physician must be on his guard against If he does not know what is in that mixture he cannot guard against them and he finds it very difficult to recognize them when they do occur

For those reasons—there are probably some others that don't occur to me at the moment, but for those reasons amongst others let me say then, a physician should not really prescribe and certainly should not be asked to prescribe medicines, without being able to find out about their composition In other words, he should not be asked to prescribe secret remedies, and for that reason secret remedies are not accepted by the Council

Q—Does the Council *admit remedies* that are advertised? *A*—It admits remedies that are advertised to the medical profession It does *not admit remedies that are advertised to the public direct*.

Q—Why is this restriction made, doctor? *A*—That restriction is made because, in the experience of the *Council, remedies* that were advertised, or are advertised to the public are very apt to be detrimental, to do more harm altogether than they do good

Therefore, in the interests of public health, the Council would be inclined to take that action, especially as it is dealing only with remedies that should be used by physicians, and *for those reasons* that I started to state physicians should not, in the opinion of the Council, use drugs generally that are advertised directly to the public There may be individual exceptions to that, but as a general rule, physicians would *not use them or should not use them*

Q—Doctor, are the actions of the Council compulsory on the physicians? *A*—*Oh, no The Council simply informs* and in that way advises Whether its advice is taken, or whether its information is considered, that is *really not the affair of the Council*, and it has not even any means of knowing what physicians, or whether any physicians for that matter, (except by some physicians writing in) follow its advice It certainly has no means of compelling anyone to accept its opinions, even if it had the desire

RULE OF THE COUNCIL

Q—Now, are the reasons of the Council as to its *actions in regard* to direct advertising set out in the rules themselves? *A*—*Yes, they are fully explained in the rules of the Council*

Q—Have you a copy of those rules? *A*—Yes I have

Q—Will you produce *it? (Pamphlet* produced by witness) What rule is it, doctor? *A*—The mention of the direct advertising, and the fact that remedies (with some *exceptions*) that are directly advertised to the public, are not admitted by the Council, is stated in Rule 3 of the Council The reasons for this are stated in the explanations to Rule 3 which I have here

Q—Will you just read this, doctor, that is, the parts that bear upon this question Rule 3 *A*—Shall I read the rule first, and then the explanation, or will you take the rule for granted? *A*—(Reading) Rule 3 *Q*—Yes, so as to get it in the record *A*—(Reading) Rule 3 *Q*—Yes, so as to get it in the record the public will Direct advertising No article that is advertised to the public will *be accepted or* retained, but this rule shall not *apply* (2) to disin fectants germicides and antiseptics—

Mr Hough—You are not reading the whole of the rule there, are you? *A*—Yes.

Q—Isn't Rule 3 "*Direct advertising*, lay advertising?" *A*—Yes, sir, that is what I am reading

Q—Are you reading the *rule?* *A*—I am reading a copy of the official rules I am reading the rules *Perhaps you are looking at* the explanation

Mr Hough —No I am reading the rule It says—

The Court —What is the date of yours?

Mr Hough —1914

The Witness —Mr Hough is reading out of the rules as they are contained in a book I am reading out of a copy—

Mr Hough —They ought to be the same

The Witness —They are identical There is some confusion Perhaps if you give me the book I can clear it up

Mr T J Scofield —I will hand you the book that I was examining you from 1916 March 1

The Witness —You are reading from the explanation, and it is the rule proper that I was reading *Shall I read this again?*

The Court —Go ahead

The Witness —I read then from the beginning and go on "Rule 3 Direct advertising No article that is advertised to the public will be accepted or retained

Mr Hough —Accepted or what?

The Witness —That means for this book New and Nonofficial Remedies These are the rules for the admission of articles for this book, New and Nonofficial Remedies

Mr Hough —But you read something that I do not see in my book Accepted or what? *A* —Accepted or retained

Mr Hough —That is new I guess 'or retained" is new

The Witness —Have you 1916?

Mr Hough —1914

The Witness —It is 1916 that I am reading There may be slight changes in the rule—

Mr Hough —The rules change every year?

The Witness —There may be slight changes in the rules from year to year yes sir (Reading)

But this rule shall not apply (a) to disinfectants germicides and antiseptics provided that the advertising be limited to conservative recommendations for their use as prophylactic applications to superficial cuts and abrasions of the skin and to the mucous surfaces of the mouth pharynx and nose (but not to those of the eye and the gastro-intestinal and genito-urinary tracts) and provided they are not advertised as curative agents. (See Comments to Rule 3) and (b) to nonmedicinal food preparations, except when advertised in an objectionable manner '

Then the explanation of these rules state as follows 'Rule 3 Direct Advertising

Mr Hough —Pardon the interruption Is this part taken out, (c) and circulars when distributed solely to physicians

The Witness —Yes sir that has been taken out. The part I am coming to now is on page 17

'The impossibility of controlling the irresponsible claims which are usually made in advertisements to the public, the well known dangers of suggesting by description of symptoms to the minds of the people that they are suffering from the many diseases described the dangers of the unconscious and innocent formation of the drug habit and the evils of harmful self medication including the dangers of the spread of many infections and contagious diseases when hidden from the physician and similar well known considerations are the reasons for discouraging in the interest and for the safety of the public, *this* reprehensible form of exploitation Advertising in medical journals etc. distributed solely to physicians does not come within the scope of this rule.

In the case of subjects on which the public should be instructed as the use of disinfectants, germicides, antiseptics and foods advertisements to the public, if not in objectionable forms, are considered admissible. In no case shall such advertisements include recommendations for use as curative agents nor shall the names of any diseases be mentioned in exploitation If the preparation is sufficiently toxic to require caution in its use to prevent poisoning this fact shall be stated on the label

The Witness —The next part is a minor explanation which I do not know whether it is desired to read down to the bottom of the page, the third line from the end I will be glad to read it if it is desired

Mr T J Scofield —Yes, go ahead I want it in the record.

The Witness —(Reading) On account of the deplorable results which follow any abuse of this privilege, the conscientious cooperation of manufacturers and their agents in adhering strictly to the limitations laid down is asked and for the same reason the acceptance of an article which is so advertised as to infringe on these limitations in any essential way (as by naming diseases or by making false and exaggerated claims) shall be summarily rescinded and the reasons for such action may be published without notice to manufacturers or agents.

A disinfectant, germicide or antiseptic, will be accepted for description in New and Nonofficial Remedies and an article of this class which has already been accepted will continue to be included with New and Nonofficial Remedies only on the explicit understanding by the manufacturer and agent that such infringements of the rule will be followed by deletion of the article and by publication of the facts as described

The Witness —Shall I continue?

Mr T J Scofield —Yes

The Witness —(Reading)

We may divide the foods into three groups. The first group contains the ordinary groups including the well known breakfast foods These do not come under the supervision of the Council in any way

The second group includes a large and important class of manufactured products, such as invalid and infant foods, which in a sense stand between the first and third groups The public has the same interest in these foods that the physician has, and usually is supplied with full information concerning them. While the primary recommendation of these articles should naturally come from the physician it cannot be expected that their continued use should depend on repeated prescriptions. Information concerning this group of foods would come naturally and properly from a physician, and the collection and dissemination of this information may very properly be included in the work of this council

As the products in this case are used extensively, it is not proper to limit their advertising to medical journals, but the advertising should be permitted in the lay press so long as it is conducted in a manner compatible with the rules of the Council

The third group includes medicinal foods proper, such as predigested foods These have a relatively low food value and are characterized by a high alcohol or preservative content They frequently contain strictly medicinal substances or food substances for which distinct therapeutic properties are claimed These products should be used only on the advice of the physician, and the advertisements should be restricted as in the case of ordinary medicines'

Mr T J Scofield —Now then, Doctor let me ask you whether or not those are rules which relate to the admission of medicines in what you call the New and Nonofficial Remedies? *A* —That was a rule and its explanation, and the book relates to that. Yes the book relates to the admission—

Q —First, if any person has a proprietary medicine and desires to introduce it or get it into that book he submits his medicine for examination and if it is right it goes into that book is that right? *A —That is the idea exactly*

Q —Now doctor I will ask you whether or not physicians are opposed to patent medicine ?

The Court —Is this his opinion you are asking for now or do you want him to tell you that as a fact?

Mr T J Scofield —I am asking for his opinion whether in his opinion physicians are or are not opposed to the use of patent medicines ? *A* —The answer must take into account whether you mean by 'patent medicines' what the words should mean patented medicines medicines on which a patent has been granted by the government of this or a foreign country In that sense it is very clear that the medical profession is in no sense opposed to them because of the extensive use of such patent preparations or patented preparations as aspirin salvarsan sulphonal atophan, and a very large number of patented articles which will be found and a considerable proportion of which are very extensively prescribed

Q —That is true of adrenalin isn t it? *A* —Adrenalin belongs to that class yes. If on the other hand you mean by patent medicine what most people mean by it, a medicine that is generally not at all patented but a secret medicine that is advertised directly to the public then I should say that the medical profession as far as I know its sentiments is opposed to the methods by which those medicines are brought on the market and brought into the hands of the consumer They are opposed to the 'patent medicine exploitation but not necessarily primarily to the patent medicine' proper

Mr T J Scofield —I think that is all doctor

Whereupon the further hearing of said cause was adjourned to 10 o'clock the following day, May 10, 1915

May 10, 1916, Morning

TESTIMONY OF DR T SOLLMANN (*continued*)

Dr Sollmann resumed the stand for the defendants

CROSS-EXAMINATION BY MR. HOUGH

Q —Doctor as I understand you have never been in active practice? *A* —No I never have.

Q —Your work has been confined entirely to experimental work? *A* —Well in a sense yes Of course I have watched the treatment of patients in the hospitals I visit the hospitals and am consulted there about treatment and watch the results of the treatment.

Q —You say you have been a member of the Council ever since it was formed how long has it been in existence? *A* —About 11 years I think it was founded in 1905 if I am not mistaken it was in February 1905 that it was founded I think I am correct about *that*

Q —How many members has the Council? *A* —It has 15 members with the secretary that makes 16 in a sense.

Q —Does that include the corresponding members? *A* —No it does not include the corresponding members no

Q —How many corresponding members have they? *A* —There are three I believe

Q —When did you first commence to publish New and Nonofficial Remedies? *A* —I think Mr Hough *that* was about two years after the foundation of the Council

Q —About 1907? *A* —I think so I might be mistaken, but that is my recollection

Q —Who appoints the members of the Council of Chemistry and Pharmacy? *A* —The members of the Council are elected or appointed by the trustees of the American Medical Association

Q —That is controlled by the trustees? *A*.—It is controlled by the trustees, yes sir

PHARMACOPEIA COMMITTEE

Q —You are a member also of the United *States Pharmacopeia* Committee? *A* —I am yes sir

Q —Are you one of the trustees of the Pharmacopeia? *A* —No

Q —Has there *not* been a controversy going on between the Council of Chemistry and Pharmacy and the Pharmacopeial body? *A* —No not as bodies Of course, individual members of any two bodies may have had a difference *in* their opinions on certain special questions but there has been so far as I know no controversy between the two bodies whatsoever They have no relation to each other and there is no occasion for controversy

Q —Well the members of the Pharmacopeial Revision Committee are not confined to members of the American Medical Association are they? *A* —By no means

Q—It represents the entire field of medicine, pharmacists, doctors, chemists and pharmacologists Is there any other classification except those, would you say? *A*—I should think they would practically come in They are elected from delegates that are sent by the medical bodies, various medical *organizations and medical associations*, pharmaceutical bodies and pharmaceutical associations and by the Government Medical Services and I think the Department of Agriculture also has representatives and the pharmaceutical schools

Q—That is, the Public Health Department of the Government and the Department of Agriculture both are represented in that body? *A*—Yes, sir, and the Army and Navy Departments I think They are elected, a body of delegates Each organization that sends delegates are entitled to three delegates and those delegates vote and elect out of their number without any direct reference to chemists or pharmacists and so forth, a certain number of delegates I ought to qualify that a little, because in the last pharmacopeia convention, there was a distinction made between *pharmaceutical elections and medical elections* It was agreed that a certain number of the new Revision Committee—it was a new departure, the Revision Committee of fifty—it was a new departure, and in order to simplify matters it was agreed there that I think 35 of those should be elected by the representatives of pharmaceutical *organizations and* 15 *by representatives of medical organizations*, or some such number I think it was 35 and 15

Q—When was the last Pharmacopeial Convention? *A*—That was in 1910

Q—They meet every ten years and revise the Pharmacopeia, don't they? *A*—Yes

Q—And then the Revision Committee is elected and the Committee works for five or six years before they finish the work? *A*—This time it is nearly six years

Q—Your new Pharmacopeia is almost finished now, is it not? *A*—It is going through the press, yes

Q—And in that all branches have participated, whereas in the New *and Nonofficial Remedy list, only the American Medical Association* appointees participate? *A*—Yes, sir Of course the medical and pharmaceutical professions and the chemists are represented on the Council still but they are, as I say, appointed directly by the American Medical Association for a particular purpose and the others are elected at large

Q—Now, about five or six years ago, the American Medical Association made an effort to get *control* of the Pharmacopeia exclusively, didn't they? *A*—No, Mr Hough

Q—You don't know anything about it? *A*—I know a great deal about what took place at that time, but I do not know of any such attempt at all

Q—What do you know about any effort of that character? *A*—There was a question at that time to a considerable extent with the opening up of the new Pharmacopeia, this decennial revision—that it would be advisable perhaps to restrict the scope of the pharmacopeia Certain people had that opinion, and other people had an opinion in the opposite direction

The American Medical Association*, as such, I think, took no part* in it at all The matters were discussed Those two policies were discussed but not at all Mr Hough, with the idea of getting hold of the Convention or putting it in the hands of the American Medical Association That I have never heard discussed even or even the idea of it

The scope of the pharmacopeia has been discussed in The Journal but all the suggestions that are made did not in the slightest degree contemplate a control of the Revision Committee by the American Medical Association I never heard a suggestion that the delegates should be elected in any other way *than the way that* has been customary

Q—How many drugs were in the last Revision of the Pharmacopeia? *A*—I happen to remember that there are 890 or 980 titles I have a memorandum, if you wish the exact number

Q—That is sufficient *A*—Something like that

Q—The American Medical Association representatives on the Pharmacopeial Board at the last Revision attempted to cut those down to *44 drugs, didn't they? A*—Oh, no, Mr Hough

Mr T J Scofield—Doctor, speak louder and more distinctly, please

A—No, not at all Never dreamed of such a thing In the first place—

Mr Hough Q—Did they ever *attempt to* cut them down at all? *A*—I don't remember who the American Medical Association's representatives officially there were I was not one of them I was a delegate from the Ohio State Medical Association But such an idea of cutting down the number of drugs in the pharmacopeia to 44, has never to my knowledge been advanced by anybody except *as* a straw man that was set up as something to be knocked down No one on the side *of the medical* profession that I know of has ever suggested any such absurd thing

Q—Didn't such an article appear in The Journal itself? *A*—Not to my knowledge, and I read The Journal pretty carefully

Q—Well, you say the suggestion was made by somebody, but you don't believe it was *anyone* from the American Medical Association? *A*—I do not know, Mr Hough, that it has ever been made or advanced *from any* responsible quarter I am simply taking your *statement* that it has been made If it has been made, it must have been *made* the way that I said I personally never heard of it

Q—You personally knew nothing about it? *A*—No

Q—Now, the significance of a drug appearing in the pharmacopeia is that it is being generally used by physicians, isn't it? *A*—Not necessarily, Mr Hough

Q—Not what? *A*—Not necessarily You mean, of the past pharmacopeia, or of the coming pharmacopeias?

Q—The past pharmacopeias *A*—In the past pharmacopeias I have not been directly concerned in their revision This was the first time I was a delegate and what *may* have been in the minds of the delegates to the previous convention of course I cannot speak of at first hand I have never taken it that all the drugs that appear in the pharmacopeia are used extensively or at all, even by physicians There are a number of drugs in the pharmacopeia that are put in there simply as reagents and again a number of things that are *put in there* for making pharmaceutical preparations

Q—I am talking about those things that are in the pharmacopeia that are to be prescribed in sickness, as distinguished from any reagents or chemicals, or chemical methods concerning the mixture of preparations of drugs *A*—Yes, I just wanted to get that clearly I should say that that was the intention of the people that *put them in*, naturally that is what they would naturally have in their minds

Q—*Viburnum prunifolium* is contained in the present revision, is it not? *A*—Yes, viburnum prunifolium is contained in the present revision Now I can tell you what the intentions were of the present revision committee as to these matters, from my personal knowledge

Q—I am only asking you if it is contained there *A*—It is contained there, yes

Q—And they have taken out the requirement in the old pharmacopeia that it is the bark of the root *Now, it is just the bark*, any part of the bark, isn't it? *A*—That I do not know, Mr Hough, at all

Q—Well you have seen it, the sheets are sent to you are they not? *A*—I have seen the sheets, but I certainly have not noticed that.

Q—You have not noticed that? *A*—No If that is there, I don't know *it at all It slipped by me, if it is there*

EARLY USE OF DRUGS

Q—How did medicines come to be used in the beginning? *A*—How did they come to be used in the beginning?

Q—*Yes* Was it not the result of home treatments, people in the country used weeds and herbs for certain conditions? *A*—Of course I cannot give you any definite knowledge about those back times I can only reason from what the probabilities are.

Q—I mean, from your reading? *A*—From the probabilities of what happened in the prehistoric times

Q—You know about Hippocrates? *A*—Well, I guess they were used before Hippocrates *no* doubt.

Q—Coming down to this country, viburnum prunifolium was introduced first as having been used *in* families in the country going out and getting the bark of a tree? *A*—That is the way I think in which it came to their attention

Q—And after extensive use that way, *it was taken* up by physicians, wasn't it? *A*—Of course I do not know how extensive the use was Mr Hough

Q—You do not know how extensively families used it at first? *A*—No, it might have been used in just one locality, one man might have heard about *it I don't know* It might have been used very extensively I have never heard a statement of that

Q—And your reading of the history of medication and drugs don't tell you anything about it? *A*—About what, viburnum?

Q—Yes, about how it was introduced in medicine *A*—Oh, yes, *I* have read the history of it

Q—Well, that was the way it was introduced, was it not? *A*—The first mention I saw of it in the literature, was in the year 1850 or thereabouts

Mr T J Scofield—A little louder, doctor

A—Was in the year 1850 or thereabouts, where, in a work on plants *I believe—it is a little hazy in my mind—there occurs* a statement that *it is used in domestic practice, I mean in* families Then that I think did not obtain any great notoriety Then there were—oh, a matter of four papers in the next 15 years and then a paper by Phares, I believe That was rejected, but he, however, states that it was introduced in that way that he learned of it through its being used in *families around in families where he was practicing*, some village in Mississippi if I am not mistaken

Then afterwards, for ten years, nothing further appeared about it, and then there came a group of papers. That is what I gathered from my reading as to the history of its introduction

Q—*Carduus benedictus* was introduced into the practice of *medicine in the same way, was it not? A*—I should imagine in some such way The history goes back to a time when there is not any literature

Dr Sollmann was then questioned in detail concerning the literature on carduus benedictus The first mention of it which he had found in connection with uterine diseases was that of Cooper in 1849 He did not remember reading Schroeder in 1693 He did read Sammon's "Herbal" in 1711 Out of forty-eight papers read since 1650, he found reference to uterine diseases in four

He testified that both carduus benedictus and viburnum prunifolium are used as a tea

Q—That is, the virtues of the drug were extracted by *the water*? *A*—Whatever virtues there were, if any

Q—And therefore water would *extract* all the virtues which viburnum prunifolium originally was supposed to possess? *A*—If it possessed any such virtues, the use of hot water, the *hot tea*, would extract them

Q—Then does the addition of alcohol help the extraction in any way? *A*—Of what, Mr *Hough?*

Q—Of the extractives of any herb, such as carduus benedictus *or viburnum prunifolium? A*—It all depends upon what the active constituents, if any, are

Q—Without reference to what they are, starting with the proposition that water alone extracts all that was originally known as medicinal, does the addition of any alcohol assist the action of the water *in that extraction? A*—You ask me there to make an assumption that I have *not* granted, that there was any activity *known* to be present in the drug originally I would be prepared to deny that, so I don't believe I could answer the hypothesis in the way you put it

Q—Whatever reputation those drugs had before they got into the pharmacopeias was due to the extractive matter brought out by the use of water alone wasn't it? *A*—No I don't believe so I would not be sure of that point, and I do not think that the drug got into the pharmacopeia until the year 1880 and I don't believe it was used exclusively by the physicians who reported upon it previous to that time, in the form of infusions or decoctions I would not be absolutely sure.

Q—I am not talking about its exclusive use by physicians I am talking about its home use which preceded its use by physicians country use? *A*—I misunderstood it then Will you repeat your question?

Q—You said it was not used exclusively by physicians in the form of a tea at the time it went into the pharmacopeia in 1880? *A*—So I believe

Q—I supposed some of them used it in the form of a tea? *A*—I believe under certain conditions at least they did

Q—But the reputation of the drug was established as an infusion of that character in its use by the women of the country before the doctors took it up at all? *A*—I do not know Mr Hough whether the reputation of it is established now and I do not think it susceptible—

Q—I am talking about whatever reputation it had at the time it first went into the pharmacopeia It must have had a reputation or it would not have gotten into the pharmacopeia isn't that true? *A*—Yes sir that is true.

Q—Now that reputation was based originally on its use in the homes of people who lived out in the country? *A*—I would not say that.

Q—Would you say it was not? *A*—That undoubtedly started physicians to trying it. There are a good many things that are used in the homes of the people that are not effective some are and some are not.

Q—Then when the physicians commenced to use it, they would first use it in the way it was being used in the homes of the country and then they might vary the use, might they not? *A*—Not necessarily Mr Hough

Q—Well whatever reputation it had prior to the time it went into the pharmacopeia as a pharmacopeial drug was based upon the extractive matters which were taken out with water? *A*—I do not know that the matter is important but I do not think I can grant that premise at all. It does not seem at all a *logical sequence*.

Q—I don't want you to grant any premise at all I want you to tell what you know as a fact, and what your judgment is from your reading and what you believe is true. *A*—I stated, I think that I did not know exactly the form it was first used in by physicians. However to cover it I wish to make myself clear

The Court—Let me ask you Dr Sollmann if the benefits from this herb were first discovered by women may we not assume that they probably extracted whatever of the active principle they got out of it, with hot water and cold water and not by the use of alcohol? *A*—So far as the use by women is concerned I think that is absolutely true, but I do not think that it necessarily follows that physicians also tried to extract the principles in the same way

The Court—Well assume that for a moment. Now if we assume that as true how much of the active principle would you get out by the use of alcohol how much more? I think that is what your question includes? *A*—Is that the tendency of it? Well since I do not know Mr Hough what the active principle is I cannot answer that question.

DRUGS IN PHARMACOPEIA

Mr Hough *Q*—Now the pharmacopeia is full of drugs of which the active principle is not known isn't it? *A*—Oh yes Not full of them by any means

Q—I don't mean that literally *A*—I took that question in the way I understood you to intend it It contains such drugs

Q—And a large number of them? *A*—Well I would not say what proportion It contains some. I could very easily agree to that but I would not say offhand how large a proportion

Q—And drugs appearing in the pharmacopeia have been used for years without knowing how the action which is supposed to be brought about, is brought about, haven't they? *A*—Oh a good many drugs have been continued that way for a long time.

Q—And that is not a reflection on the drug that the method of its action is obscure is it? That is if you do not know how it acts? You do not know how it brings the results, which are attributed to it That is not a reflection on the drug is it? *A*—Well, I would not say that it is a reflection on the drug, exactly but it is a reflection on its use to a considerable extent

Q—It is a reflection on its use? *A*—Yes

Q—Then why did you put into the New and Nonofficial Remedies stypticin with the statement that its method of action is obscure? *A*—Yes.

Q—I say why did you put it in if it is—if it should not be there? *A*—I did not say that no drug should be used unless the method of action is known I said it reflects upon the—

Q—Upon the use of it? *A*—That is upon the use.

Q—But when you put a drug in this it is an invitation to a doctor to use that drug isn't it? *A*—It says that so far as the Council can ascertain that sort of a drug is perhaps worth trying

Q—It is an invitation to use it, isn't it? *A*—I would not put it in just those words

Q—Then of course it cannot be any reflection upon anyone who does use it without knowing how it acts? *A*—I would not say it was a reflection upon anyone who uses it but I think if he knew how a thing acted he would prefer that and he should always be trying to find out how this does act.

Q—Now the practice of medicine has been carried on for a long time before physicians knew just how the drugs did bring about the results which they were supposed to bring about That is a fact isn't it? *A*—In a sort of a general way it is The physician will use the best means he can He does not always choose to use those means but if nothing better is available he will use those means He will try to find out how the drugs act They have been trying to find out in a way since they began to use drugs, and have formed various ideas about it but they did not have the means for finding out and as soon as the means were furnished by the progress of science they at once turned to them to try to find out

Q—They did not then prescribe the drugs they had been working on or cease to prescribe them because they could not find out how they acted? *A*—Not unless they found one that they could find out how it acted

Q—In other words they might get a substitute and they preferred to use something that they knew how it acted rather than to use something that they knew did act though they did not know how it acted? *A*—I think in a general way I might agree to that. Of course it is rather an involved general statement but I think I can agree to that

Q—You understand what I mean by the question, didn't you? *A*—I think so

Q—How many of the drugs that are in the United States Pharmacopeia have been proved pharmacologically? *A*—I never figured that out Mr Hough

Q—Ten per cent, would you say? *A*—Oh, the majority of them I should say but that is an offhand statement. A considerable majority of them

Q—Do you think more than half have been proven? *A*—I think so yes

Q—Is there any list anywhere published of the drugs which have been proven pharmacologically? *A*—Not that I know of except, of course all sorts of books on pharmacology which will give information as to what has been done on the subject If work has been done on it and that has led to any results so one could check it up—but I have not got it in my mind

Q—Do you now regard pharmacology as an exact science? *A*—Exact is rather a relative term in human affairs

Q—I did not hear you *A*—Exact is a relative term in human affairs

Q—A relative term? *A*—Yes. A thing that is exact in one connection is not exact in another If you are weighing a ton of coal a pound or two makes no difference It is still exact. If you are weighing a diamond a pound or two would make a fundamental difference it would not be exact at all It is all relative so it is a very hard question to answer

Q—Well in that sense or in either sense would you say that pharmacology was an exact science? *A*—I don't believe I could *answer that* question as a broad proposition

Q—Well like mathematics say? *A*—Oh, no, it is not like mathematics.

Q—There are still many sources of error in it are there not? *A*—Well it is susceptible to improvement yes Mr Hough

Q—What is that? *A*—It is susceptible to improvement like all biological science.

Q—And proof by whatever method you achieve or establish that a drug acts upon a lower animal would be reasonable proof that it acts in some way upon the human being That is one of the fundamental principles of the science is it not? *A*—That if it has some action on lower animals that it will have some action on human beings I should state that as a broad proposition yes

Q—Would you state that the negative or reverse of that is also true without qualification? *A*—That is to say that if a drug has no action of any kind on a lower animal—

Q—No action which you discovered by your tests? *A*—Yes Or any action that can be discovered by the methods of pharmacology elaborated up to the point where they are elaborated now, I suppose you wish me to assume?

Q—Yes *A*—That where no action can be discovered that way it still could have an action on a human being?

Q—It still could have? *A*—I mean is that your question?

Q—Yes I asked that question *A*—I should say only through the imagination

Q—What is that? *A*—Only through the imagination I think. I could say that I think without further qualification

Q—Did you test cactus pharmacologically? *A*—Personally?

Q—Or with any assistants? *A*—No

Q—Or did you participate in such a test? *A*—No

CACTUS

Q—Well cactus was determined pharmacologically by your Society or your Council as possessed of no therapeutic value whatever was it not? *A*—That was the conclusion yes

Q—And an article to that effect was published in The Journal was it not? *A*—I think there were several articles to that effect published in The Journal if I recollect.

Q—And an investigation of its use among physicians showed after that time that it was used more than any other drug in their armamentarium *A*—Not to my knowledge, no

Q—Do you know anything about any investigation of that character? *A*—I don't think so Mr Hough.

Q—What is that? *A*—I don't think so it does not occur to me now

Q—Then do you know that after you decided here that it had no therapeutic action under your pharmacologic tests it was demonstrated in the pharmacologic institute of Berlin by Dr Grever that it had therapeutic action? *A*—No I don't *think so* Mr Hough

Q—You don't think so? *A*—I don't think so

Q—You don't think what? *A*—That it was demonstrated there that it had a therapeutic action.

Q —Do you know the *experiments that were made?* *A* —I think I know the experiments to which you refer Well, I read a paper—I don't remember whether I read it in the original or in the abstract when it was published, and that must have been some four or five years ago, *and I have not read it since, so I do not know how accurate my recollection of the details of that paper may be* The recollection—

Q —Whether you agreed with the conclusions or not, it was reported at that Pharmacologic Institute that it had been determined there that cactus did possess therapeutic action That was the effect and substance of that paper and report, was it not? *A* —No, I would not say that

Q —Well, what was it? *A* —*My recollection of the general conclusion* was that when used in large doses the particular drug that they were working with (which may or may not have been cactus)—

Q —Which may or may not have been cactus? *A* —Yes, sir, that is what I said

Q —Well, *it may or may not have been cactus that you used here* *A* —No, that was cactus That was identified by competent botanists of the United States of the Smithsonian Institution, I believe it was, but the doubt on that subject is a very serious one, because there has been a great deal of confusion in the botany of cactus, a very great deal, and no work on cactus would deserve any consideration unless the species was definitely *identified as the one that is supposed to be* used in medicine

Q —Was that not definitely identified as cereus grandiflorous in that Berlin experiment? *A* —Not that I recall

Q —Have you any reason to believe that in Berlin they would not be as accurate on that subject as in this country in the Pharmacologic Institute of Berlin? *A* —That *might easily be the case* *There could not* have been the great confusion that exists in that as we know it over here where the product has been more extensively employed

Q —All you now say is that you disagree with the conclusion or you don't remember— *A* —Oh, yes, I recall the work It did not say that the drug had any therapeutic usefulness directly That question was not touched in that piece of work at all

Q —*Did it say that it had any action on the lower animals?* *A* —In very large doses it did produce a result on the animals but as I explained yesterday, that does not necessarily signify that the drug has any therapeutic usefulness

Q —But it does show that it does have some action on the human being? *A* —If used in adequate doses and so forth If I recall the papers that were published on the cactus, on the part of the Council, they also I believe showed that if you used enormous doses you got some sort of an effect My recollection on that is not clear, but that is my general recollection

Q —Is not this what The Journal of the American Medical Association said— A —I could not identify it, but if you have The Journal there and read it, then it is what it said, but I could not from my recollection of several years ago say whether what you read is what it said

Q —Do you recall that they said that it was absolutely inert on animals when used in a thousand times the amount of the dose on a human? *A* —I don't recall, but that very likely is what they did say, I don't know

DR SOLLMANN S BOOK

Q —Doctor in view of what you have testified to about the accuracy of deductions based on experiments on animals what did you mean in your book, 1914 edition, under the head of 'Effect of Drugs in Disease" when you said, "Animal experiments are of but limited value in this connection" *A* —If you will read the *remainder*—

Q —(*Reading*) "And we are forced to rely mainly on observation of *patients*"

Mr T J Scofield —What page is that?

Mr Hough —That is page 125

The Witness —If you will read that whole paragraph it will explain itself I will try to give you an offhand explanation It was written ten years ago, and agrees *exactly with* what I said *yesterday*

Q —Is it a fact that animal experiments are of but *limited value in* establishing the effect of drugs in disease? *A* —That is what I said yesterday, too, Mr Hough That the effects in disease, as distinguished from the action, as I explained yesterday (drawing that distinction) might be different, and that would have to be determined by the direct trial, and that is why one could not tell from the fact that a drug *had an effect on animals,* that it would be a useful drug I thought I explained that.

Q —You testified yesterday that the action of drugs is the same, but the effect may be different? *A* —Yes

Q —Well, now, you state in your book "The action of drugs is not the same in *health and disease*" *A* —Exactly It does not contradict it strange as it may seem, and if you read that whole paragraph, it explains itself as showing that here *I used the term "action"* rather loosely, which one often does One often says that a drug has such and such an effect of course, and the drug has no effect It has an action and that action produces an effect Vice versa if one is not trying to draw the distinction between the two things, one often says "action" when one means "effect" If you will read this paragraph all the way *through* it will show I happened to look it up last night.

Mr T J Scofield —Doctor, here is your book Read the paragraph

Mr Hough —Just let me *finish*

Mr Walker —You have not any right to take the witness now We have got the witness

Mr T J Scofield —I have got the witness long enough to see that you don't—

Mr Hough *Q* —You said *yesterday that* the action of the drug was the same, didn't you? *A* —I said that the action of the drugs were the same

Q —Now, in your book there you say that the action of drugs is not always the same in disease, as in health? *A* —Yes, and you are quibbling about a word there, Mr Hough, which is fully explained in the context It is the way in which a word is used One can use the same word in different ways

Q —You mean when you testified on the stand, *you meant* the effect, and when you wrote the book, you meant the action? *A* —When I wrote the book here, I meant the effect in the sense in which I explained it yesterday I was not trying there to make a specific difference between the action and the effect, I was not trying to make that difference clear, and that paragraph explains itself, if you will read the whole paragraph, and the one following it

Q —I will *read further from the paragraph* *A* —You should begin at the beginning if you wish to get the meaning of that paragraph, and not begin in the middle

Q —I am going to read the next following paragraph What I have just read is the first paragraph under the heading, "Effect of Drugs in Disease" *A* —As it says—

Q —The next paragraph says, 'The differences are, however, as a rule quantitative rather than qualitative" *A* —Yes

Q —(Reading) "Since drugs are in practice employed most extensively in disease, their action under those *conditions is of the greatest* importance As a general rule it is possible to explain and even predict the action of drugs in disease from their action on normal tissues. However, the actual test must always be made Animal experiments *are of but limited value in this connection and* we are forced to rely mainly on observation of patients" *A* —Yes, *of* course, that is self evident, the reason for that If we are going to see the effect of a drug in a disease, we must have that particular disease before us

Mr T J Scofield —Read further there, read the whole paragraph, go right on

Mr Hough *Q* —*You say this* was written ten years ago? *A* —That was written ten years ago

Q —In your preface, don't you say that this has all been rewritten? *A* —Ten years ago it was rewritten

Q —In the *1914* edition, don't it say it has all been rewritten for the *1914 edition?* *A* —*That* title page there was *absolutely* a complete surprise to me I *may state as a matter of fact,* that this book has *not been revised or rewritten, or to my knowledge altered except that* title page, since the year *1906* When I started to revise it I found that the subject at that time had so much advanced that I could more easily write an entirely new book, which is now in press, than to revise this That is the reason why there has been no revision since that time and this title page was put in there without my consent, and even without my knowledge, and when I saw it here a *few* weeks ago, it was a complete surprise to me

Q —Well, doctor, your book has a number of other mistakes in it Have you discovered them in the new edition you are now working on? Have you discovered that there are a number of other mistakes in the 1914 edition? *A* —I should not be *surprised* but what there would be quite a number of mistakes, but as I say—

Q —I can hardly hear you If you please, will you sit further out *A* —I cannot move the chair, Mr Hough, it is nailed down

Q —Well, I will *move forward then* *A* —I rewrote it, and therefore, I would not be able to tell you whether I have corrected the particular *mistakes* that I made in this, or did not, I hope *so*

Q —Who wrote the statement that it had been thoroughly revised, and entirely rewritten for the 1914 edition? *A* —No, sir, I did not

Q —*Who did state that in your book?* *A* —*That is the preface* of the edition of 1906, Mr Hough

Q —And it don't refer to 1914? *A* —No, it does not

Q —Well, what about the young doctors who have been misled by these things in the book? They are misled, are they not? *A* —They have not been misled by my fault, Mr Hough

The Court —*It is perfectly obvious* that they will have to take their chances.

The Witness —It is very strange what liberties publishers will occasionally take

Mr Hough *Q* —You mean, that was put *in by the publisher,* and not written by you? *A* —No That was put in by the publisher without ever consulting me, or telling me about it even Of course the preface I put in in *1906*

Q —Not rewritten, but in writing this new book you say you have rewritten this all again? *A* —Yes, sir

Q —Well, in doing that, did you find that in a number of places you had *misquoted* the pharmacopeia? *A* —I do not recall except one instance of that, and then it was not a quotation of the pharmacopeia, it was a synonym that got confused I will be glad to have you call my attention to it

Q —I have a memorandum of it *A* —I will be glad to have it, and I *will be sure to* check them up

Q —Yes, I think that is important

Mr Walker —Yes, help along the new edition

The Witness —Of course that might not apply, because that pharmacopeia *will be out of print when the* book gets published, I hope so, at least. *Did you* say I misquoted the pharmacopeia, did I understand you correctly?

Q —I beg pardon? *A* —Did you say I misquoted the pharmacopeia?

Q —Yes, in the origin of plants, and in the percentages, the amount

A —I would like to see that

Q —Well, for instance, *on page* 103 if you have your book Would you like to look at the book, while we go over *the mistakes?*

The Court —Mr Hough, is the book on trial here?

Mr Hough —No, but the witness' accuracy is

The Court —He admits that he has made some mistakes in the book

Mr Hough *Q* —Doctor, in these pharmacologic tests which you made, the greatest accuracy is required, isn't it? *A* —The greatest that is obtainable, Mr Hough

Q —And if you make a little mistake, even of a small percentage or the fraction of 1 *per cent* in one case, it may make a totally different result may it not? *A*—Oh no that all depends It is the same story again as with the ton of coal and the carat of diamonds Sometimes the fraction of a per cent. makes absolutely no difference and in another case it may make an enormous difference just as with the diamond and the coal

Mr Hough—I am willing to give the witness the benefit of the memorandum of mistakes that I have found if he wants them

The Witness—I do not happen to see any pharmacological quotation—any pharmacopeial quotation on page 103

The Court—You are testing the witness general knowledge He may have made a few mistakes in that book but he was asked certain things on his direct examination Now if he contradicts himself as to those the point is important or if he contradicts himself in the book. But this is on a subject that is not at all allied with the matter before us now, that we are investigating What difference does it make?

Mr Hough—Except to show the general method of work of the witness, who is testifying as to certain experiments which he has made which require the greatest accuracy

The Court—If you deem it important, I am not going to stop you but it seems to me that this Jury and the Court have a great deal to do besides that.

The Witness—In that connection may I remark that page 103 does not seem to me to contain any quotation from the pharmacopeia whatsoever so far as I can notice here and Mr Hough calls my attention to misquotations from the pharmacopeia

Mr Hough—That was the most insignificant one In there you gave the botanical source of cochineal as coccus cacti whereas the pharmacopeia gives it as false coccus cacti

The Witness—This is not intended to be a quotation from the pharmacopeia.

Q—That is what you have there? *A*—No sir Cochineal U S P—I stop there and make a dash and then give my own interpretation of what it is. It is not put in quotation marks and in no way is it a quotation. It is simply my statement in a brief form of what that is and if the rest of them are that way I would protest against their being called misquotations from the pharmacopeia

Q—You mean that you are making statements different from the pharmacopeia? *A*—I may easily make statements different from the pharmacopeia

Q—But when you are doing so after mentioning the pharmacopeia in such a connection that you would lead one to believe that that was in the pharmacopeia—

A—I think anyone who is familiar with these books the term 'U S.P put after the name means nothing more than that the drug is contained in the United States Pharmacopeia, and that is where that part of the information stops. Whenever I quote from the Pharmacopeia, I follow the words U S P in connection with that particular quotation. For instance when I say such and such a dose 'U S P

Q—Well without running through them all, will you look at page 330 colchici semen is given as 55 U S Pharmacopeia and you have it 45" instead of 55 *A*—That is in colchici semen?

Q—Yes? *A*—You say it is 45 instead of 55?

Q—Yes? *A*—That would be an error in that case.

DR. SOLLMANN'S EXPERIMENTS

Q—Well, I won t run through all of them. Now you made a test of Wine of Cardui on a dog in a saline solution? *A*—No I did not say that Mr Hough.

Q—What did you say? *A*—I made some tests on the uteri of guinea pigs and on the human uteri but I made no tests on dogs personally

Q—No tests on the live animal at all? *A*—None at all personally

Q—And the only tests you made were by putting strips of uteri in this solution? *A*—That was the extent of my personal experience, yes

Q—What was that test that had the straight line on? *A*—The wavy line you mean?

Q—Yes? *A*—That was on the human uterus, excised, human uterus.

Q—The excised human uterus? *A*—Yes.

Q—I thought you connected that with a dog? *A*—No I was asked a hypothetical question in which I was to assume certain other work that had been done beginning with excised uteri I believe, and leading up to animals, dogs—excised human uteri and, I believe a uterus in the living subject and I was asked to give an opinion on those experiments in connection with my own experiments as to whether the drugs would have an effect on the uteri movements or whatever it was

Q—When you put the strips of uterus in this saline solution you don t tie it to any string do you? *A*—Generally put a little hook, or hook a pin into it and tie it to a lever

Q—On a string? *A*—On a string

Q—And it runs into the solution? *A*—It runs into the solution yes

Q—And then you put in that solution a certain amount of the drug in this case Wine of Cardui? *A*—That was the idea yes

Q—Considering the amount of solution in which the amount of Wine of Cardui was put, and including the alcohol that was in the Wine of Cardui— *A*—Yes.

Q—the percentage of alcohol to the whole volume was about 2 per cent. was it not? *A*—No much less than that.

Q—Less than 2 per cent? *A*—I think so I think the strongest concentration I used in the case of Wine of Cardui was 1 to 30 so that would be only 3 per cent. of Wine of Cardui, and one fifth of that is alcohol, so it would be one fifth of—I must start again One fifth of 3 per cent that would be three fifths—six tenths of 1 per cent.

Q—Was that the experiment in which there was a depression which you thought was due to the alcohol? *A*—That was in the fluidextract of cnicus benedictus which contained a much higher alcoholic percentage of course.

Q—That was the case in which you said the alcohol was present in about 2 per cent? *A*—I think it came to something like 2 per cent

Q—And 2 per cent of alcohol in that saline solution had an effect on the uterus which was appreciable? *A*—Yes Coming to check up the subject it was 1 5 per cent but I consider that immaterial.

Q—So that if 20 per cent of alcohol was brought in contact with the human uterus, it would have a much more marked effect would it not? *A*—If it was left in contact with it Mr Hough it would have If the human uterus was placed in the same solution, in the salt solution where the alcohol would stay in contact with it Then it would have a marked effect

Q—Does the salt solution help the action of the alcohol? *A*—No

Q—Then if you put alcohol 20 per cent solution on the human uterus direct, without any saline solution the effect would be very much more marked? *A*—No not necessarily It all depends on whether it would stay there

Q—Whether it would stay there? *A*—Yes

Q—How long would it have to stay there? *A*—In the case of alcohol to get that depression it would probably require—to get a noticeable depression—something like several minutes probably

Q—Ten minutes? *A*—It might be less than that likely less than that I should say

Q—If it stayed there that long there would be a marked effect would there not? *A*—I think there would be a marked effect in that case yes, sir

Q—Now is it not a fact that there is a difference between the action of a drug on a diseased and a healthy uterus? *A*—I think not Mr Hough I think I stated—

Q—Did you ever experiment on a healthy uterus? *A*—On a healthy uterus?

Q—Yes *A*—Well I considered those uteri practically healthy

Q—You considered all of them so? *A*—I think so One of them was carcinomatous but the part of the tissue that we took, was of course not the carcinomatous tissue

Q—Well would it not make a difference how long it had been out of the human body? *A*—Not in the direction of the results. The direction of the results would be the same The extent of the results quantitatively will be a little different.

Q—How long would you say that the uterus remains alive after being taken out of the human body? *A*—If you place it on ice, and leave it on ice and then put it again in the warm solution—

Q—I did not hear that word *A*—If you place it on ice, so it does not putrefy if you keep it from putrefying and if you put it on ice then you can revive it by putting it in the warm solution after five or six days under favorable conditions

Q—Five or six days? *A*—Yes, sir five or six days.

Q—How long had each of these uteri been out of the body that you used? *A*—I think they had been out of the body several hours

Q—Several hours? *A*—Yes and one we might have used the next day I do not clearly recollect but I think these tests were made—I have made some other tests with other drugs so my recollection on that point is not clear but I think all of those were on the same day that they were removed

Q—Was that experiment made in Cleveland? *A*—Yes sir that experiment was made in Cleveland

Q—Or here? *A*—Cleveland

Q—How did you happen to get the strips did they take them out for the purpose of the experiments? *A*—Oh no Mr Hough

Mr T J Scofield—Speak out loud *A*—They did not of course

Mr Hough *Q*—They were going to take them out anyway? *A*—And the surgeon who took them out absolutely did not know that they were to be used afterward even. I got them from the pathologist

Q—Is it not an unusual thing to remove a uterus where there is merely a displacement? *A*—It depends on the extent of the displacement I would not be in a position to discuss the details of those clinical cases but I know that they were taken out for the good of the patient in the direct line of the surgical work. The way I got them is—after the uteri are taken out at the advice of the surgeon they are turned over to the pathologists for microscopical examination of the tissues and he takes out a small piece that he uses for that examination and the rest of it is ordinarily destroyed Now I asked the pathologist who goes to several of the hospitals for this material asked him instead of destroying what he did not need to put it on ice for us or bring it directly to the laboratory where we could work with it.

Q—Do you know whether there is anything in a saline solution such as you use which would interfere with the action of either carduus benedictus or viburnum prunifolium? *A*—No

Q—Do you mean that you do not know or that there would not be? *A*—There would not be

Q—You are positive of that? *A*—I feel positive of that Mr Hough

Q—Did you ever make any experiments to ascertain that fact? *A*—I have made numerous experiments with the different kinds of drugs and saline solutions of various kinds and all the drugs that could give an effect—that did give an effect in the intact animal also gave an effect of the same kind in the saline solution Therefore the saline solution had no essential effect—I might almost say no effect of any kind—on the character of response or on the presence or absence of response.

THERAPEUTIC INCOMPATIBILITY

Q—Well there is such a thing as therapeutic incompatibility isn t there? *A*—Oh yes

Q—And that means that one substance, drug or otherwise, might be mixed with another drug so as to absolutely neutralize the action of the other drug? That is a fact isn t it? *A*—Well, I don t know whether as a scientific general proposition I could exactly agree with that, but I think I can agree with what you mean by the proposition That is to say—

Q —In general? *A* —That most of the actions of the drug might be removed by another one It is hard to conceive of one drug absolutely removing every action of another drug, but for practical purposes I am willing to grant that you may make that assumption

SYNERGISM

Q —That is the basis of what you call synergistic action? *A* —Yes. Of course, as I explained yesterday, the extent of that is comparatively unknown, and one has no right to assume anything of that kind, unless it has been shown

Q —You mean about the synergistic action or the incompatibility? *A* —About what you call incompatibility there

Mr T J Scofield —Will you talk a little more distinctly, I want the jury and everybody to hear you

Mr Hough —Has there been any experimentation to determine the synergistic action of drugs? *A* —Oh, yes

Q —That is, more than has been carried on to determine the therapeutic incompatibility? *A* —You don't mean these particular two drugs You mean drugs in general?

Q —Yes *A* —Of course the experiments that were made along those lines were made so that they would show either synergistic or antagonistic action, what we call—well, never mind the term Of course they have been made so that they could show either—the direction of the same experiments would show either one I think on the whole, more instances have been found of the synergistic action than what you call therapeutic incompatibility

Q —Now, the synergistic action is best where the two drugs are generally indicated for substantially the same conditions Isn't that so? *A* —You mean, it is most pronounced, or you would employ it, or what do you mean, "it is best?"

Q —Well, most effective, or possibly most pronounced *A* —You are using the term synergistic action—or we are using it for producing an action greater than would be produced by either drug alone in the same direction

Q —The sum total of the two drugs *A* —Yes Of course the answer to that question follows from the question You may get a synergistic action of those two drugs that act in the same direction If they act in opposite directions, then of course you would not get a synergistic action

Q —It goes without saying that the two drugs should be indicated for the same condition *A* —Yes, sir

Q —And according to the writing on carduus benedictus in some of the authorities, they were indicated—carduus benedictus was said to be good for the same thing that viburnum prunifolium was good for? *A* —I don't believe I could agree to that With all my reading on the subject I have not found a very clear idea as to the exact condition for which either of those drugs were indicated, and therefore I could not say really whether they were indicated for the same condition

Q —Well, suppose we use words They were said to be good for menstrual disturbances Those words were used, were they not? *A* —Yes

Q —And said to be good for womb trouble Those words were used, were they not? *A* —Yes, sir Shall we start on one of these, or do you want to give me the whole list?

Q —I am talking about carduus benedictus *A* —Very well

Q —And it was good for inflammation of the womb? *A* —Yes, sir

Q —And it was good for—

Mr Walker —He answered with a nod

The Witness —Yes, sir

Mr Hough —So that in a general way and in that sense the literature recommends it for the same thing that the literature recommends viburnum prunifolium for, without reference to whether they have any action or not in your opinion, or in anybody's else opinion? *A* —Yes

Q —They do, don't they? *A* —I think we make some very broad assumptions in that, in assuming that they are recommended for the same thing They recommend it, you might just as well say—you might just as well say that a drug is recommended for a headache to illustrate and give you an example that is sufficiently broad

Q —Well, maybe I can make it plainer The same words are used in the book—

Mr T J Scofield —I did not understand that answer Please read it

(The answer was then read)

Mr T J Scofield —Now what else, let him finish

Mr Hough —That was not responsive anyway

The Court —Go ahead, Mr Hough

Mr Hough *Q* —The carduus benedictus, to go back to words again then, is used or recommended in books or said to be good in books, those books that you read, for menstrual disturbances of women? *A* —Yes

Q —And for womb troubles? *A* —Yes

Q —And viburnum prunifolium is said also to be good for those same things, isn't it? *A* —Yes, I assume that

Q —Now this synergistic action that I referred to would mean that when one was added to the other the combined effect was more than the addition of the co efficient would it not? *A* —I get the idea, yes

Q —That is true, isn't it? *A* —That is the definition

Q —That is what is meant by synergistic? *A* —I accept your definition I think it is a very good one

Q —Now that condition is usually true with reference to two drugs that are mentioned for the same thing You say of course they must be mentioned for the same thing? *A* —That have the same kind of action You are mentioning, for instance, the menstrual disorders. One thing may act on menstrual disorders using the broad term you are using, in the one direction and the other might act in an opposite direction Those two things would not be synergistic, they would be antagonistic

Q —You mean they produce the same results by different means, is that what you mean? *A* —No

Q —You mean that, to be synergistic, they must produce the same results by similar actions, similar properties? *A* —Something of that kind

Q —If they produce the same results, but by dissimilar action, you would say then it is not synergistic? *A* —They might still be synergistic in a sense It depends—it must be an action in the same direction, however, or it becomes, by your very definition, an antagonism.

Q —Now, have you ever made any experiments for the purpose of determining what would be the synergistic action of 6 grains of viburnum prunifolium to 30 grains of carduus benedictus to the fluidounce? *A* —Before you add something you must have something to add Now my experiments showed that you did not have any effect from the viburnum prunifolium, and you did not have any effect—

Q —So you have made no experiments of that kind? *A* —No

Q —Then that is all that is necessary Have you ever heard of any other experiment— *A* —May I explain why I did not make them, Mr Hough? May I explain why I did not make them?

Mr Hough —One moment Did I say 6 to 30?

The Reporter —Yes.

Mr Hough —Well, that should be 60

The Witness —All the same Now may I explain why I did not make them?

Q —Well, as you have not made them, that is all that is necessary Doctor, carduus benedictus is one of the highest priced drugs imported into this country, isn't it? *A* —Carduus benedictus?

Q —Yes, highest priced? *A* —Why not according to what I have been told about it, I do not have any direct personal knowledge of it.

Q —Haven't you read the report of the Department of Agriculture as to drugs, weeds and herbs, used in medicine? *A* —I read that quite a while ago

Q —Didn't that state that it was more expensive than digitalis? *A* —That I could not tell you, but that still would not make it one of the highest priced drugs imported into this country

Q —I don't mean highest priced drugs, I mean herbs, used as drugs *A* —Herbs used as drugs?

Q —Yes *A* —If you use the term "herb" technically, which comprises only relatively a small number of drugs, that may be true for all I know If you mean crude drugs, plant drugs, that certainly would not be true.

Q —It is more expensive than digitalis, which is fox glove, isn't it? *A* —I could not say whether it was or not It depends of course on the quality of the digitalis leaves. I know we have paid quite high prices for some good quality digitalis leaves, and I doubt very much whether the other would come within a small fraction of that price

EFFECTS ON ANIMALS AND MAN

Mr Hough —Doctor, how many drugs, if you know, have an important or positive effect on man, which do not have the same effect on animals? *A* —The same effect, Mr Hough? No, I would not say—I would not say off hand that there are any That is a pretty broad sort of question, without having any particular instance in mind

Q —Then let me put it more concretely Potassium iodid has no action on a dog? *A* —Oh, yes, it has, Mr Hough

Q —In what way given? *A* —Given in any shape or manner whatsoever

Q —Has that been tested on a dog? *A* —Yes

Q —In what way was it tested? *A* —It causes—for instance, I know—I made some experiments myself in that direction, and also experiments have been published a long time ago, when it is injected by stomach tube, it produces, in adequate doses, a pleural effusion That is accumulation of fluid in the pleural cavity, over the lungs That is one effect in particular that I know has been produced

Q —Well, that is used for gumma in men, is it not? *A* —Yes, for certain syphilitic lesions

Q —Now, does the experiment on the dog indicate such use on a man? *A* —I don't believe, Mr Hough, that you would simply, from watching that action, think of its—of using it in gumma on man But I believe that it tends to explain the mechanism of the action on man Do you wish some other instance of its action on animals, Mr Hough?

Q —Does that explain its effect on gumma? *A* —On gumma only?

Q —Yes *A* —I would not say off hand that the experiments that I have in mind explain it. They might have some bearing upon it. But they explain its therapeutic use, if you desire that

Q —Is it not a fact that rabbits may be fed for weeks on belladonna without showing any symptoms at all? *A* —No, I would not say that Mr Hough—without showing any symptoms at all

Q —What would you say on that? *A* —They would get a dilation of the—

Q —Let me put it this way—I withdraw that question How long may rabbits be fed on belladonna leaves without showing any symptoms? *A* —That depends upon the dosage, how much they would eat, etc

Q —Are you familiar with Cushny's statement on the subject? *A* —I may have read it a long time ago I have not read Cushny's book since—in general since a long time ago, and not on that subject, I know

Q —Is there anything in your book on the subject? *A* —There may be Not as you put the question, Mr Hough The statement, as I would think it was in my book—I have not looked it up recently—would be to the effect—at least that would be the intention of it though I don't recall the wording—that animals can be fed on bella donna—rabbits you are speaking of and, curiously, fed on belladonna leaves exclusively and raise litters of young even on that ordinarily poisonous diet, and yet remain alive It does not show—it does not mean that there is no effect upon them There is a quite distinct effect on them, and the reason why it has no effect is—I mean no fatal effect—is also quite interesting that is known to a certain extent that I could explain, if you desire.

Q—They use it as a food—the rabbits use it then as a food? *A*—You give it to them as a food and make them use it I don t think they would spontaneously use it that way

Q—Well do they object to using it as a food? *A*—According to my recollection I don t exactly know I suppose, since they can be kept alive on it they would have no very serious objection to it

Q—I mean they don t show aversion to it? *A*—I don t know, Mr Hough at first whether they do or not, but evidently, eventually they eat it.

Q—How much is the dose for man of belladonna leaves? *A*—Of belladonna leaves?

Q—Yes *A*—I could not give you that off hand, Mr Hough I should imagine possibly something like 2 or 3 grains.

Q—Is it not just 1 grain? *A*—It might be 1 grain Of course the dosage of those things varies to some extent. In some conditions you employ larger doses and in some smaller But it might be very well 1 grain—

Q—That is the average dose given in the pharmacopeia is it not? *A*—I don t remember but if you state so, I will very willingly accept your statement

Q—Speaking of the pharmacopeia when the pharmacopeia—when the Pure Food Law was passed there had to be a number of changes in the pharmacopeia didn t there? *A*—I don t know about that Mr Hough whether there had to be any changes in it or not. That was before the time that I was connected with the pharmacopeia, I think—

Q—Well but— *A*—In any way

Q—Haven t you a copy of the revised edition of 1907? *A*—Yes Now, when you mention it, I believe there had to be some little corrections with a book of that size—

Q—Well there were more than 150 changes that had to be made in the pharmacopeia? *A*—That Mr Hough is scarcely a fair statement of the situation That is to say, the same change had to be made often quite a number of times The real changes if you do not count the number of times that the same statement is repeated is not so many I have no personal knowledge of it. Now take this number of changes and they would be considerably less I have a vague idea of hearing Professor Remington say it was small twenty or thirty but I might be mistaken My recollection is vague

Q—But whatever the number was they were all included in a little pamphlet that was sent out after they were agreed upon by the committee, to those who already had the pharmacopeia which had come out two or three years previous? *A*—I do not know about that, Mr Hough I had several copies of the pharmacopeia and I do not remember of receiving a pamphlet. It might have been sent I do not remember at least.

Q—Then they were all embodied in a reprint and revision of the Pharmacopeia of 1907? *A*—So I believe or some such year I do not know the year

Q—And these changes were necessitated by the passage of the Food and Drugs Act? *A*—That was the occasion for them at least but, really Mr Hough I could not give you any information of any value on that subject, because I was not at all connected with it.

Q—Can you think of any other drugs or substances which have a pronounced or lethal effect on man which have no such effect on the lower animals? *A*—I have not thought of one yet, Mr Hough. You have not given me an instance and I have not thought of any

Q—If you should inject some castor oil into the buttocks of a dog what effect would it have? *A*—I have not the slightest idea

Q—It would not have any effect at all would it? *A*—I do not know I haven t the slightest idea

Mr T J Scofield—Your Honor, we have been very patient here in listening to a lot of interrogations that are not suggested by the examination in chief at all, or by anything that was brought out in the examination in chief

The Court—I did not hear the question, Mr Scofield

Mr T J Scofield—He wants to know what would be the effect if you inject castor oil into the buttocks of a dog

The Court—He may answer

Mr Hough—I want to take issue with Brother Scofield's statement that it is not material to anything brought out on direct examination It is directly in point, in view of the witness' statements on direct examination

Mr T J Scofield—From no standpoint is it material.

The Court—He may answer

To which ruling of the Court, the defendants etc. excepted

Mr Hough *Q*—Well now then that would not prove if that had no effect that castor oil would not be good in a man would it—in a human?

Mr T J Scofield—The injection in the buttocks, Mr Hough?

Mr Hough—Yes but I will let him inject it into any other part of the anatomy of the dog that he likes—for the purpose of answering the question

The Witness—If I had my way Mr Hough and I wanted to determine the effect of castor oil on a dog I would naturally give it by mouth as the only way in which I would naturally think of giving it that is to act on the alimentary canal

Mr Hough *Q*—Did you ever give any other medicines to a dog by the mouth? *A*—Oh yes

Q—In testing them? *A*—Yes.

Q—Which other ones? Which have you given, I say? *A*—Which have I given by mouth?

Q—Yes *A*—Emetics and cathartics, in the first place, I naturally give those by mouth Iodid I have already mentioned as a drug I have given by mouth There is a large list I could not think of off hand, but if you give me a list of drugs, I might remember what I have used But it would be difficult to choose out of the large number of drugs, off hand, and tell you those I have used by mouth and those I have not. It is a large list.

Q—There are drugs, doctor that can act on conditions—diseased conditions in the female pelvis without acting directly on the muscle of the uterus, are there not? *A*—That could act on the female—on the—

Q—Diseased condition in the female pelvis, without acting— *A*—Directly on those?

Q—Without acting on the muscles of the uterus? *A*—They might act on the blood vessels

Q—That would be taken through the mouth then wouldn t it? *A*—Through the mouth?

Q—They would be taken through the mouth? *A*—Might or might not

Q—For instance, a medicine which was—is an hepatic stimulant acts best taken through the mouth, doesn t it? *A*—The term hepatic stimulant' is a little vague to me Mr Hough If you could explain to me just what you mean by that—it is a term which is used here—I might be able to answer your question more intelligently

Q—Well I am using words in medical literature and I supposed you would understand the sense in which it was used. *A*—I do not know whether—I do know ordinarily—

Q—Well if you don t—if there is a medicine which acts on the portal circulation that would act best if taken through the mouth wouldn't it? *A*—It all depends upon the way in which it would act on the portal circulation, Mr Hough These are very indefinite ideas that you are dealing out here, and so I can only answer them in an indefinite way, by saying it might or might not. You will have to get a little more definite—if you want me to assume a definite case or you want to present a definite case to me, but you will have to be a little more definite—

Q—I am leading to the question which I asked before which is That there are other ways of medicines acting on this diseased condition in the female pelvis, than acting directly on the muscle of the uterus? *A*—I so stated in the direct examination

Q—And when those medicines are given to act in that way they are given best through the mouth are they not? *A*—In that particular way that I think you have in mind

Q—Doctor, you are a chemist, are you not? *A*—Oh—to a certain extent at least Mr Hough

Q—Suppose you were given a chemist s report which says of a certain medicine or compound that it is a dark brownish liquid having a neutral reaction a peculiar valerian like odor and a bitter mawkish taste arsenic, bromids iodids the potent alkaloids such as aconitin, morphin and strychnin, or the emodin bearing drugs such as aloes, cascara and senna were not found Potassium bitartrate (cream of tartar) was absent, thus indicating the absence of wine from grapes Alcohol was determined and 20 36 per cent. of absolute alcohol by volume was found The volatile matter amounted to about 97 per cent.— *A*—97 per cent.?

Q—Volatile matter *A*—Yes.

Q—The nonvolatile residue appeared to consist of vegetable extractives. This had a bitter taste and gave very faint reactions for alkaloids The quantity of alkaloid was too small to possess any appreciable medicinal effect, whatever its potency might be. Small quantities of a nitrate were present. A trace of combined ammonia also was present Could you state from that report what the herbs or drugs were from which that medicine was made?

Mr T J Scofield—If the Court please, I object to the question If he wants to ask him the question—or ask him a question based on the chemical analysis, let him read it all, and not a part of it, and omit some of it

Mr Hough—I have omitted only the comments I have stated the facts

Q—I say from those facts could you state or could any chemist state what the ingredients were, from which that medicine was made other than the alcohol which of course is indicated—specified? *A*—Stating the results as you do Mr Hough—

Q—What is that? *A*—Stating the results as you do—

Q—Yes. *A*—Assuming these to be the things I don t believe any one could say from that alone what particular drugs had been present there. You could say a large number that had not been present—a large number very large number but you could not say what particular drug devoid of these active constituents might or might not be there.

Q—And that would still leave a large number of drugs which might still be in there I mean excluding those which are specifically excluded *A*—Stating the thing without any other knowledge of the preparation that I think would have to be said

Q—Now when did you first learn that Wine of Cardui contained carduus benedictus and viburnum prunifolium? *A*—When did I first learn that? My first knowledge of the subject at all came in the article from which I take it you are practically quoting

The Court—You mean the article in the American Medical Journal?

The Witness—The first article in The Journal of the American Medical Association. That is the first I knew about the carduus benedictus at all.

Whereupon an adjournment was taken until 2 o'clock p m of the same day, May 10, 1916

May 10, 1916, Afternoon

TESTIMONY OF DR TORALD SOLLMANN (*continued*)

The Court met pursuant to adjournment Dr Sollmann resumed the stand for the defendants

FURTHER CROSS-EXAMINATION BY MR. HOUGH

Dr Sollmann testified that he first learned of the presence of carduus benedictus and viburnum prunifolium in Wine of Cardui when he read the article in The Journal He could not tell absolutely from that article that such were the contents, but the article suggested strongly that these substances were there His next information on the subject came in a conversation with Mr Scofield in which he heard the deposition of Mrs McElree His next information on the subject came from reading the papers of the Chattanooga trial in which it was stated that it had been admitted for the purpose of that suit that there were contained in Wine of Cardui as essential ingredients carduus benedictus and viburnum prunifolium in the combined quantity of 66 grains per ounce His next information came in a letter from Dr Leech in which the latter stated that he had prepared a synthetic formula corresponding in analysis to Wine of Cardui

SYNTHETIC PREPARATIONS

Q—*Doctor, couldn't you* make a synthetic preparation out of other material than those two, which would compare exactly chemically with Wine of Cardui, and which did not contain any carduus benedictus or viburnum prunifolium? *A*—By the exercise of considerable skill and having an exact analytical scheme in mind, such a thing might be more or less *remotely* possible It all depends upon how many data you have before you can see if you can match it. The hypothetical question that was asked me on that account assumed the presence of certain things which were found in this synthetic formula A and in no other

Q—Is it not a fact that one could extract a mixture of gentian and chiretta, with 20 per cent alcohol in your product, yielding three to three and a half per cent. of residue when extracted, then adding a small amount of oxalates, a trace of valerianic acid, a trace of alkali, a trace of potassium nitrate, of citrates, malates, and then subject this product to the same chemical examination to which Wine of Cardui was subjected in the laboratory of the American Medical Association Wouldn't the analytical results be the same as for Wine of Cardui, though, as a matter of fact, there was no carduus benedictus or viburnum prunifolium in it? *A*—May I ask a question, what the two drugs were that you assumed there?

Q—Gentian and chiretta *A*—Gentian and—

Q—Chiretta. *A*—Oh, yes Corresponding to which analysis, Mr Hough?

Q—The one that was testified to, the one that was made in the laboratory of the American Medical Association *A*—I want to get the question right, Mr Hough, as I believe there were several analyses testified to in regard to that

Q—Well, compare it with the one that was read to you here, with which you were to compare the synthetic medicine *A*—I don't believe so, Mr Hough, not in all respects possibly in the respects that you name, but not in all the respects that were intended in the question that was asked of me

Q—Now, in what respect would it differ? *A*—I *would have to* review that question And I do not know as I could definitely tell then in what respects it would differ I say it is inconceivable to me that it would agree in all respects You have added certain particular things to it now, and those particular things you might possibly—I don t say you would, but you might possibly make it agree in those particular things. That, however, you could strike on such a thing accidentally, that, of course, is an entirely different question But I am granting that you might make it agree in those respects—but that you also having made it agree in those respects, make it agree in all the other respects, that I cannot possibly conceive

Q—Then, because the chemical analysis of the two—that is the Formula A and the Wine of Cardui—appeared to be identical, it would not necessarily follow that Formula A was made of the same ingredients that Wine of Cardui was made of? *A*—It would follow as necessarily as the laws of probability admit, Mr Hough

Q—Well, you have just said, haven't you, that it would be possible to have it made out of something else? *A*—It would be possible, but it would be inconceivable

Q—Well, how is a thing that is possible inconceivable? *A*—This way, Mr Hough Now it is perfectly possible that, coming out of the court here and going across the street, I might find a bag with a million dollars on the street. Now, theoretically, that is possible At the same time it is absolutely inconceivable

Now, in just the same way, it is possible that I might on the first trial of this kind strike a combination that agreed in every respect—you would, if you tried it—with all of the things that have been named —that cnicin like residue, the products of the distillation, the reaction of the distillate, in all these respects, that it would agree, is theoretically possible, in just the same way as it would be possible for me to now cross the street and pick up a million dollars lying in a bag on the street

Q—Well, instead of inconceivable you mean probable, don't you? *A*—Well, as you like to use the terms But the analogy is fairly perfect in my mind, whatever terms or words you apply to it—that is perhaps a matter of choice

Q—Can you think of any other *method* from which a synthetic product could be made up which would analyze chemically the same as the analysis of the Wine of Cardui, which was read to you in direct examination? *A*—I could not say, Mr Hough. By feeling around I might try to construct such a formula, but I certainly could not say offhand what might be used I do not know of anything that would give a cnicin like residue, except the thistle species, that is all I know of, *or have heard about*—that would *give a residue of* the cnicin like characters which I understand I was asked to assume are discovered in this mixture

Q—*Don't you think the* power of suggestion was the controlling thing in your mind? *A*—No, *I don't think so*, Mr Hough.

Q—You don't? *A*—No

Dr Sollmann was then asked concerning his comparison of oats and straw to carduus marianus and carduus benedictus He stated that when he made this comparison he had in mind that an action had been attributed to carduus marianus on the basis of certain clinical observations which action had not been determined in carduus benedictus He had not read Shoemaker or Reel

The witness has not made any experiments on carduus marianus to determine its medicinal value The witness could not tell the difference between cnicus marianus or cnicus arvensis *The latter is mentioned* in his book, which is a book of reference He is not personally acquainted with every drug mentioned in the book

Q—How did you *happen* to put in cnicus arvensis, and not put in cnicus or carduus marianus or benedictus? *A*—I could not tell you that. I mentioned that in my book in a list of bitters that had been used in domestic medicine, and that I considered of no particular value, and therefore I did not particularly take *much pains to study* more about them. I think I said *so in the book*

Q—Is that the reasón you put viburnum prunifolium in the book that you did not consider it of any particular value? *A*—I don't put things in just because I consider them of no particular valuê. I did not put that in because I considered it of no particular value.

Q—When you put viburnum prunifolium in this book, you thought it was of some value? *A*—I doubted it

Q—You doubted it? *A*—Yes

Q—But you put it in as good for menstrual disturbances and as a uterine tonic and sedative, didn't you? *A*—No

Q—Did you put it in as a uterine sedative? *A*—I put it in Mr Hough, because I was giving information there about what various drugs were used for In the case of some drugs I had personal experience with them, and I gave that, in the case of other drugs, the reading that I had done on the subject, or the work I studied convinced me it was a good drug, and then I stated so In the case of other drugs, I put them in, and the reading had not particularly convinced me, because I had no particular—made no particular study of the literature, or because the literature was so unconvincing and not decisive in that case I simply made a statement of the uses to which it was put, and qualified that, if necessary, by what I thought about it, further *And* it was *in that* way—

Q—That is, it had not been proven pharmacologically? *A*—It had not been proven pharmacologically, yes

Q—You stated— *A*—Or clinically, as the case may be. *If I knew* it had not been proven clinically, or rather that it is practically valueless clinically, I would say that

Q—But, putting it in the book was suggesting to the *student* coming on to use it if it is necessary, wasn't it? *A*—No, Mr *Hough*

Q—What was your book written for? *A*—Just information about *things that* are of known use

Q—Information to whom? *A*—Students and practitioners. *It is* a reference book

Q—I beg your pardon? *A*—It is a reference book, as well as a textbook

The witness was then questioned concerning his assumption in the *hypothetic question* The witness stated that he had assumed what the question had asked him to assume regardless of his belief He has heard of other experiments made with the drugs mentioned all of which were negative with the exception of one experiment *performed on* the uterus of a virgin cat on which there was an action in large doses like the toxic action of ergot

The witness was then asked in detail concerning the experiment which he performed on the guinea-pig He stated that the uterus removed from the body and sliced in strips, in its response to the action of drugs, is the same as the uterus in a live woman's abdomen This would be dependent on the condition under which the uterus is kept The witness does not know of any medicine which acts on the uterus through the spinal cord

The witness was again asked concerning his assumption in the hypothetic question and he stated that he assumed the actions that were submitted to him without assuming anything else about the constituents

The witness stated in response to a *question* that under certain conditions alcohol in Wine of Cardui would make the medicine inadvisable in female troubles and this would be true as a general proposition

The witness was asked to name pharmacopeial preparations of which a person could take such an amount as would create intoxication He mentioned whisky and brandy, also simple elixir Taken in doses prescribed in the pharmacopeia he would not regard them as usually intoxicating although they might produce alcoholic effects

ALCOHOL AS A FOOD

Q—Is not alcohol a food up to a certain extent, a certain per cent ? *A*—Up to a certain per cent—the percentage question has little to do with that nothing to do with it

Q—Has nothing to do with it? *A*—No

Q—What do you mean in your book by limiting it to 20 per cent ? *A*—I don t recall that I did, Mr Hough

Q—What is it? *A*—I don t recall that I so limit it.

Q—Reading from your book page 414 Small amounts of weak alcohol taken at meals cannot therefore have a bad effect upon digestion and may even act favorably The alcohol should not be taken in strength greater than perhaps twenty per cent *A*—From your reading I hear nothing about food

Q—I am talking about whether or not the per cent. is indicated—you said it had nothing to do with it. Why then did you limit it to twenty per cent.? *A*—That was the question of food Mr Hough Your question applied to the food of the alcohol Now I tell you why I limit it there to 20 per cent is because you are speaking of the local action on digestion there.

Q—I was asking you about whether or not alcohol in certain proportions would be regarded in certain doses as intoxicating or non intoxicating and I understood you to say that the percentage had nothing to do with it that is the dilution *A*—Not of intoxication that is correct—but it does not say anything about intoxication there

Q—Now in what connection and in what sense did you make this statement? *A*—In the statement that you just read?

Q—Yes. *A*—That was in regard to its effects upon digestion, as you read it there

Q—Why did you limit it to 20 per cent ? *A*—Because stronger concentration disturbs or tends to disturb digestion

Q—Then the percentage has something to do with it, hasn t it? *A*—It has something to do with the effect on digestion but you did not ask me at all about that and I am trying to be responsive

Q—You say you were not asked about it— *A*—Not in what you read

Q—What does this sentence mean By the chemical energy thus liberated alcohol can perfectly replace carbohydrates and fats in the diet and is a typical non nitrogenous food *A*—Yes, Mr Hough but—

Q—Yes. *A*—Now may I discuss that a little?

Q—Certainly discuss it at your leisure. *A*—In the first place Mr Hough you started out from a question you asked me, what effect the alcohol would have—if I perfectly recall it—as a food in certain dilutions and I said the percentage has nothing to do with it we are speaking of the food question and I repeat again that as far as the food question is concerned the concentration of the alcohol has nothing to do with it

Then you read me a paragraph as to the effects of alcohol upon digestion in which the concentration has something to do with it Now you have not asked me a word about digestion You had asked me about its action as a food

Q—You said you were not talking about it as a food *A*—I am trying to be responsive to the question I am perfectly willing to reply to any question you ask me only you must ask it. Now—

Mr Hough—Now I will ask you—

Mr T J Scofield—Let him finish

The Witness—Now you come and read me a part of a sentence—I think it is a part of a sentence—but let me call it a sentence if necessary out of a paragraph and if you will have the kindness to read that paragraph through you will see what I said about the subject of alcohol in the year 1906 and if you want to ask me directly about my present opinion as to the effects of alcohol as a food I am perfectly willing to give you this—whichever you want, or both

Mr Hough *Q*—You mean this was a statement you made in 1906? *A*—That was a statement I made in 1906

Q—And what you said in 1906 is now no longer true? *A*—No What happens is my present opinion entirely agrees with what I said in 1906

Q—If it is your present opinion that it was not the truth at that time you were giving misleading information weren t you to the students? *A*—One gives the best information that one can in the stage of the science at that time—

Q—Of course. *A*—but Mr Hough that statement is perfectly true if you will—

Q—Why did you reading this language—

Mr T J Scofield—Let him answer—

Mr Loesch—Let him finish

Mr Hough—My what a chorus.

The Witness—But what I am asking you to do Mr Hough is not to take out a part of a quotation but to give the whole text. You know the old proverb about who can quote scriptures to suit his purposes—but I want you to give the whole text. Now if you will be good enough to read that whole paragraph—and I do not remember whether the other paragraph is necessary to that but I think the one paragraph at the bottom of that page and the first part of the next page you will get perfectly my opinion in the year 1906 and it expresses perfectly my opinion in the year 1916

Mr Hough *Q*—It is still your opinion then? Your opinion has not changed? *A*—It has not changed

Q—I understood you to say it had changed. *A*—No

Q—Now, I will read the rest of it "It is even superior to other foods— " *A*—Might I be permitted to have a copy of the book before me when you read Mr Hough, so I can see—

Q—Your counsel has a copy of the book, and you can follow me.

Mr Walker—Be sure you read it right

The Witness—I don't doubt but that Mr Hough will read it right, only I want to get in all that particular place there about it

Mr Hough *Q*—Now, after "non nitrogenous food" you say "It is even superior to other foods in one particular, viz., in that it does not require digestion ' *A*—Yes

Q—You stated that? *A*—Yes

Q—Is it a fact that it is superior to other foods? *A*—In that respect

Q—Now, I skip down to— *A*—No, no, Mr Hough, I would not skip I would not agree to that—I understood I was promised—I was desirous of having you read the whole thing, and I don t like the skipping after the promise was made

Q—Very well I will read it all ' By its poisonous side actions however it may at first cause an increased nitrogen excretion in individuals not accustomed to its use but this action disappears in a few days and it then saves nitrogen like any other food " Does that suit you better? *A*—That is what I want Now, the remainder of the explanation comes in the large print on page 415, the first paragraph there if you will read that

Q—It says Whilst there can be no doubt that alcohol is an excellent food in the sense of being a source of energy, other factors must be taken into consideration ' is that the thing? *A*—Yes that is proper

Q—Now you do say— *A*—Oh, the rest of that paragraph, if you please that whole paragraph

Q—All right 'The increased nutrition may itself be detrimental to the body either by preventing the complete combustion of metabolites which may possibly be connected with the origin of gout, or by leading to an abnormal deposition of fat A still more potent objection to considering alcohol as a generally useful food lies in its toxic action, especially its psychical effects. Alcohol can therefore be employed as a food only when a sufficient supply of energy cannot be obtained from an ordinary diet as, for instance, in digestive disturbances or when the demands on the organism are unusually large as in fever ' *A*—I think that sufficiently covers my opinion on the subject I would be glad to explain it further if it requires any further explanation

Q—Now then, what do you mean when you say ' Alcohol should not be taken in strength greater than perhaps 20 per cent."? *A*—On account of the local effects on the gastro alimentary canal

Q—Then if not taken in quantities greater than 20 per cent it would not have that effect— *A*—It would—let me get that question

Q—Wouldn t that effect— *A*—Let me have the question

(Question read)

A—It would not have that deleterious local effect that is right yes sir

Q—Now is it a fact that you recommend alcohol in any inflammatory conditions? *A*—In any inflammatory conditions? I could not say off hand, Mr Hough whether I did or did not

Q—What does this mean, on page 416 'Use in fever, chills inflammatory conditions etc ? *A*—Yes

Q—Does that mean that you recommend it in inflammatory conditions? *A*—In certain kinds of inflammatory conditions

Q—Now on the next page, 417 'In convalescence and general debility — *A*—Yes

Q— The value of alcohol in these conditions is established by long experience. Is that a fact? *A*—I think so Let me see now whether it is necessary to read the rest of that to explain it Mr Hough

Q—Now then—well you can read it if you like. *A*—I think that is self-explanatory I will be glad to read it if you wish

Q—Now did you say that 48 drops of alcohol, in a 20 per cent solution in a single dose is intoxicating? *A*—I say in a certain sense you can say it is intoxicating but I would not say in the sense that intoxicating' is commonly used no

Q—Then you say it is nonintoxicating? *A*—In the sense it is generally used

Q—In the ordinary sense? *A*—Yes in that dosage

Q—Did you make any experiments for the purpose of determining how rapidly the solid extracts from either carduus benedictus or viburnum prunifolium deteriorate? *A*—No and I would not know how to make such experiments really

Q—Why does the pharmacopeia not make all their fluidextracts in solid form? *A*—Because some people prefer to prescribe them in liquid form I suppose

Q—Don t you say it is a good deal better in liquid form? *A*—It may be, under certain circumstances a good deal better in liquid form yes sir

Q—And will keep better? *A*—That depends upon the drug

Q—Some drugs will keep better? *A*—Some drugs undoubtedly will keep better in liquid form. Others undoubtedly will keep better in solid form

Q—Haven t you written or stated that medicine in tablet form is not scientific medicine? *A*—I do not know as I have stated that Mr Hough

Q—What is your present opinion? *A*—That for certain medicines it is a very good way of administering them. For instance nitroglycerine tablets if they are properly made and not stored too long are very well exhibited in that form

Q—Suppose they were prepared for a long storage would they be good in that form? *A*—A fairly long storage Mr Hough. The nitroglycerin tablets are rather susceptible to a variation that occurs during the manufacture, rather than in their keeping

Q—Now then, what medicines— *A*—Then, of course, medicines that are given hypodermically are very commonly exhibited in tablet form All drugs that dissolve very easily can very nicely go in tablet form, if not volatile

Q—If there are any volatile oils in medicine, it could not be in tablet form very well, could it? *A*—Volatile oils can be given in that form Soda mints are often used in that form, and they contain the volatile oil of peppermint

Q—Now, what kind of medicines could not well be given in that form? *A*—Medicines that are *not* easily soluble, such as for instance, bismuth powder that will not spread over the intestines, things like salol which are not easily soluble, which tend to fuse into a *mass* of crystals if given in tablet form, and drugs that will volatilize pretty easily Of course, one could not give the things like *phenol (carbolic acid)* in that form, because it volatilizes pretty easily

Q—Doesn't the fact that these different fluidextracts, tinctures and syrups which have alcohol in them are specified in the pharmacopeia in that form indicate that the pharmacopeial revision committee think that that is the best form? *A*—Not necessarily, Mr Hough

Q—Not necessarily? *A*—A great many of these preparations are brought down from olden times, and people are used to prescribing, from the old days, and so they keep on prescribing that tincture, the way it is composed, although something else might answer the purpose just as well Now, as long as they are prescribed, the pharmacopeial committee takes it for its function to introduce them into the pharmacopeia, as long as they are fairly good preparations, still, it does not mean that they are necessarily the best In some cases they are the best It depends upon what is in them

Q—What is that? *A*—In some cases, the alcoholic preparations, of course, are the best

Q—Now, heat in making fluidextracts is never beneficial, is it? *A*—Heat?

Q—Yes *A*—Yes

Q—It is beneficial? *A*—Oh, beneficial? Official I thought you said

Q—No, beneficial *A*—It would not be beneficial, but that does not mean necessarily it would be detrimental

Q—Didn't you read in some of those books on carduus benedictus, that heat was detrimental to it? *A*—Some claim that heat is detrimental to it, but I don't know that the evidence for it is very good

Q—Do you know any evidence against it? *A*—You refer, I imagine, to the work on cnicin in that connection, do you, Mr Hough?

Q—What is that? *A*—The work on cnicin? that is, the—

Q—Natavelle? *A*—There is a very peculiar thing put in this work, which has prevented me from placing any confidence in it.

Q—Well, but there were other works which referred to that, weren't there? *A*—All the other works—that was work which was very indefinite—messy mixtures that really don't show very much of anything

Q—They have united in saying that heat is deleterious, haven't they? *A*—It produces, as they claim, certain amounts and degrees of heat, under certain conditions, and the amount of heat, etc—well, I have not been able to make much out of them

Q—Is it your opinion that the cnicin in carduus benedictus is the only active principle in that drug? *A*—I doubt whether I would call that active

Q—You mean in your opinion there are no active principles? *A*—I should rather—well, of course, the term "active" is always a relative term, but, my opinion—I at least doubt—I might say I think that there are no really active principles there There is a bitter principle of some sort or the other that has been called cnicin

Q—Is there a bitter principle in carduus marianus? *A*—Very, very little—in the seed, I am speaking of now

The witness believes that the statement from his book that "it is often desirable to have the patient ignorant of what medicine he is taking," is still true, also

> "On the one hand if he possesses this knowledge, he very frequently has preconceived ideas of the action of the medicine, and will either take it in excessive amounts, or will neglect to take it entirely, or interfere with its action in some other way On the other hand, it will encourage the habit of self medication"

Dr Sollmann was then questioned concerning his illustration about corn He stated that he believes that it helped to make the subject clear He was also questioned as to the drugs administered in self-limiting diseases such as pneumonia and whooping cough He does not know that any one has made a statement that the self-limiting disease should never be treated by medicines

Q—Doctor, what is the effect of the trophic nerves of the various organs of the body? *A*—The trophic nerves? That takes one into a subject of physiology with which in that particular I do not believe I am very *familiar* I think there has been some doubt expressed as to whether such things actually exist as trophic nerves and the responses that have been attributed to them, which have been explained by effects on the blood vessels But I would not presume to a sufficient acquaintance with that subject to make my testimony on it of much value.

REDIRECT EXAMINATION BY MR T J SCOFIELD

On redirect examination, it was shown that the statement concerning colchicum in Dr Sollmann's book was copied from the pharmacopeia at that time and that there was a mistake in the pharmacopeia, later corrected by an addendum Dr Sollmann had not made any revision of the book after publication which has been published One revision is now in press

Q—Now, Doctor, something has been said to you about your views on the subject of alcohol in this examination, and excerpts have been read to you from your book? *A*—Yes, sir

Q—From this place and that place, by gentlemen in their examination Now, I will ask you *if it is not true that* in your textbook you did not say on page 419, on the subject of "Alcohol and its Habitual Use"

> "It may be considered as proved, some authorities to the contrary notwithstanding, that a certain amount of alcohol (*variable in individual cases*) may be taken daily without any demonstrable *permanently* injurious effect But it stands equally certain that it is as dispensable to the organism as nicotine or caffein, and that it must be looked upon purely as a luxury The injury done by such use of alcohol lies alone in the fact that it is so apt to lead to the use of immoderate amounts"

Did you say that? *A*—I did

Q—And then did you say

> "With such excessive use, a train of phenomena *results* which may be grouped together under the name of chronic alcoholism and which depend in part upon the irritant action of the alcohol and in part upon specific injury to the neurons."

Did you say that? *A*—I did, neurons, meaning nerves

Q—And further

> "The first effects are local and depend largely upon the concentration of the spirits They consist of a catarrh of the whole alimentary canal, progressing from the pharynx downward They are characterized by the usual symptoms of catarrhal gastro enteritis loss of appetite, gastric distress, irregularity of stools, longing for spices, etc The chronic catarrh leads to malnutrition and emaciation when strong spirits are used It also appears to constitute a predisposing factor to carcinoma of these organs. In the case of excessive beer drinking, the habitual overdistension of the stomach leads to chronic *dilatation*"

Did you say that, Doctor? *A*—Yes, sir

Q—And carcinoma means a form of cancer, a malignant disease? *A*—Yes

Q—And then did you say

> "The continued presence of alcohol in the body sets up a series of irritant and degenerative phenomena in various other organs with which it comes in contact. These changes consist in fatty infiltrations, cellular degenerations and hypertrophy of connective tissues The neurotic changes in the tissue cells must be attributed to the continued irritation from the constant presence of the alcohol, and to this must be added the interference with circulation due to the changes which alcohol causes in the blood vessels These two—the direct irritant action of the alcohol on the cells, and the impaired circulation are inseparably connected in the production of the degenerations Of these, the fatty are the most common, since alcohol by its combustion, prevents the normal consumption of fat Connective tissue formation results as the ordinary consequence of necrosis of the —"

The Witness—Parenchyma That means essential cell tissue

Mr T J Scofield—That is too much for my medical learning A gentleman whom I used to know sometimes when he could not pronounce a word, used to say "we will pass that by" (Reading continued)

> "These changes are proportional to the concentration of the alcohol And since this is naturally greatest in the liver, kidneys and blood vessels these organs show the action first and most prominently And in the liver again, the periphery of the lobules is mainly affected, on account of the anatomic relation to the portal vein"

You said that, doctor, in regard to alcohol? *A*—I did

Q—Now, then, doctor, I suppose you still hold and maintain those same opinions now, do you not? *A*—I do, yes

Q—When you said in response to Mr Hough, that 48 drops of alcohol in a tablespoonful dose of solution was not intoxicating, what did you mean by that? *A*—He asked me in reference to one single dose, and my statement referred to the—

Q—But suppose it is repeated three or four times a day, and advised to be continuously taken in that way over a long period of time, then what would you think and say about it? *A*—Well, it might not produce the symptoms of drunkenness that are so often spoken of as intoxication, but it would produce the toxic, chronic effects of alcohol to a greater or less extent, depending upon the susceptibility of the individual

Q—Now, doctor, you used the word "toxic" What is meant by the word toxic? *A*—Poisonous The word "intoxication" means really poisoning

Q—Mr Hough asked you if, in your book, you have not referred to viburnum prunifolium as being employed more or less as a uterine sedative in menorrhagia and dysmenorrhea threatened abortion and so forth I will ask you if you did not say concerning viburnum prunifolium, and its use for such purposes, on page 510, that there is no experimental foundation for its use," referring to these things which I have just called your attention to *A*—I so stated

Q—Is that true today? *A*—That is more true today even than then

Q—It is true today that you have by some experiments that you have conducted found that it is not— *A*—That it is useless.

Q—good for those conditions *A*—Yes.

Q—Doctor, you have stated also in answer to Mr Hough on cross examination, that since 1840 you have read some 40 papers or articles or some 44 articles or papers written by different people on the subject of carduus benedictus *A*—Since 1650, 48 papers

Q—Very well since 1650 And that out of the 44 there were some four of them as you recall that seemed to indicate or contend or state that it has some sort of uterine action From the experiments which you have conducted and from your knowledge derived from a study of carduus benedictus in connection with the pharmacological experimentation which you have recently made with the opinion of these four gentlemen whoever they were that carduus benedictus might have some sort of action on the uterine organs of a woman change the opinion which you have expressed here? *A*—The four references to that subject that I recall gave no results of individual experiences of the authors They gave no sign that the authors had ever observed these actions. On the other hand they give considerable signs of confusion with the drug carduus marianus that had been used for menstrual disturbances to a greater or less extent

Since then these mentions of the drug contain neither any evidence nor any reference to any evidence they would not alter my opinion at all I would still think the drug is worthless as far as any knowledge of it is concerned The papers that mention it I would neglect and feel quite justified in neglecting completely

Mr T J Scofield—If the Court please, there was one question which I neglected to ask on the direct examination, and I would like the privilege of asking it now

The Court—Go ahead

Mr T J Scofield—It is not in the line of redirect examination

Mr Hough—I don't object

Mr T J Scofield—I was asking the Court for that information

Mr Hough—Don't you want to know whether I object or not?

The Court—As a matter of course, counsel consents

Mr T J Scofield—All right

Q—Doctor do you know what if anything is being done today and has been done during the last number of years by the medical profession by way of preventing disease? *A*—I know considerable about that in a general way

Q—I wish you would tell the jury what you know about it

Mr Hough—I think that is irrelevant and immaterial

The Court—It strikes me, Mr Scofield, that you are opening up a subject that will take the better part of the time between now and the adjournment of court for the summer, if it is to be discussed intelligently

Mr T J Scofield—Your Honor will remember when the opening statement was made in this case—and I don't wish to speak in the presence of the jury—

The Court—No no but this question seems to me to be a very comprehensive question If Dr Sollmann tells all he knows about that, we won't get through with this witness this week.

Mr T J Scofield—I am making my offer based upon what Mr Walker stated reflecting upon the medical profession

Mr Hough—Mr Walker never meant to reflect on the medical profession and I do not think he did

Mr T J Scofield—Well, we will read it after a while, and see what he did say

Mr Walker—All right

Mr T J Scofield—I said to the court and jury that I would show or we would show in our case that the doctors were using every effort to prevent disease, and thereby curtail the amount of money which they might otherwise make and it is for the purpose of placing ourselves upon the record now as we should be placed that we make this offer

Mr Walker—Why it is not in the record anywhere, it has not been contested here

The Court—I recall distinctly, Mr Walker, your statement to the jury

Mr T J Scofield—May I be pardoned for one additional suggestion? The court will remember that when Dr Webster was upon the witness stand a question was asked as to the publication of certain articles the $2 000 proposition, as your Honor will remember, by the American Medical Association through the columns of The Journal, where it was stated that physicians' incomes were reduced largely by reason of the fact that patent medicines" existed, and that the American Medical Association through The Journal and others, were therefore against patent medicines' and proprietary medicines

Mr Hough—That has nothing to do with this

Mr T J Scofield—It has within this line—

The Court—Mr Scofield you have not understood me I said to Mr Walker that I remembered distinctly the charge he made in his opening statement and that I felt something of this sort was proper But I am still of the opinion that your question is too broad

Mr T J Scofield—I do not want to broaden it. I will confine it to the—

The Court—Because, if the witness tells us everything that he has heard about it, that the doctors have been doing in the last ten or fifteen years, we will never get through

Mr T J Scofield—I will simply ask him to confine himself to such preventive measures as relate to typhoid fever, diphtheria, tetanus and yellow fever, measures of that kind as to what is being done and then if they want to go into it on cross-examination, they can

Mr Hough—I object to that The public is doing those things, not the doctors They are not going down in their pockets, and paying out their money to do this The public is doing it We are paying for it We don't deny that those things are being done

The Court—You may ask Dr Sollmann whether some public official discovered the matter of the typhoid prophylactics or some doctor in his laboratory did it, and so with others

Mr T J Scofield—I will accept the court's suggestion I will take the question as the Judge has suggested it

The Witness—Will you please repeat that

(The statement of the court was then read)

A—The matter of typhoid prophylactics takes in two quite distinct phases purification of the drinking water and the disposal of the garbage, sewage rather, and the employment of typhoid vaccines The matter of the purification of water supply and sewage has been elaborated by the bacteriologists, which were to a large extent physicians and has received every encouragement from the health officers

The people who were most instrumental in getting this pure water proposition pu into practice were the health officers who were medical officers and who had the most active support of the medical profession —they had that support, although undoubtedly the cutting down of the frequency of typhoid fever has cut down the demand for physicians enormously

The matter of typhoid vaccines was principally introduced by medical officers of the United States Army, by the Medical Service and has been widely adopted by physicians whenever it was possible to adopt it

Mr Walker—Do we have an objection to that?

The Court—Oh, yes

Mr Walker—It does not come up in the form of a direct objection, but we object to the whole subject matter

To which ruling of the Court in permitting said testimony to be given the plaintiff etc., excepted

The Court—Well, I presume that it is admitted by the plaintiff as to all the various preventive measures of disease that are known today, that the doctors even of the American Medical Association make use of them

Mr Walker—Oh, sure

Mr Hough—Certainly

Mr Walker—But that don't affect the materiality of the subject matter as proper matter to be introduced in evidence

The Court—No

Mr T J Scofield—I think, if the court please, that is all we care to inquire

The Court—I want to ask the witness one question Going back for a moment to this synthetic proposition Are there any other drugs that is other than viburnum prunifolium having a valerianic odor which are reputed to have, or have been reputed to have an action on the human uterus?

The Witness *A*—Nothing on the uterus The drug that I think of at the moment as having a valerianic odor, and not being viburnum prunifolium is valerian itself and it has through its odor probably a certain use in hysteria

The Court—Well, has that an action or has it a reputed action on the human uterus valerian?

The Witness—It has no reputed action, and it actually has no action

The Court—Are you enough of a botanist to tell whether the representation of the plant on the carton of the Wine of Cardui fairly represents the thistle, from which the carduus benedictus is made? *A*—It does not represent it at all. That is probably an entirely fanciful representation

Mr Loesch—What was that answer?

(Answer read)

The Court—That is all I want to know

RECROSS-EXAMINATION BY MR. HOUGH

The witness was further questioned as to the dates of revisions and reprints of his book. He stated that he had not kept track of the dates when reprints were issued, but that the last revision was in 1906, as shown by the date of the copyright, as printed in the book

Q—Did you know it was being reprinted in 1912? *A*—I think so I don t know whether I did that particular year, but I knew reprints were being made.

Q—After 1907? *A*—After 1907

Q—And you did nothing to correct this statement in accordance with the correction that had been made in the pharmacopeia? *A*—No I did not make any revision at all It stood in my mind as stated here by the copyright, that there were no revisions made since 1906, "copyrighted 1906"

Q—Now, did you mean by what Judge Scofield read to you, on the subject of alcohol in your book, to contradict what I read to you from your book, on the subject of alcohol, or were the two intended to be taken together and construed together? *A*—You asked me only about one single dose

Q—No, no, I am talking about what you said about 20 per cent of alcohol in foods. *A*—I said, that as far as the food was concerned, 20 per cent. of alcohol, or the percentage of alcohol, made no difference I think I said that.

Q—But I say, as to this statement you say, "Alcohol should not be taken in strength greater than 20 per cent."

Mr T J Scofield—That is not reexamination of anything I asked him

Mr Hough—I am entitled to ask him whether the statement—

The Court—Let me ask the witness, did you mean what you said in your book? *A*—Yes sir, I meant what I said in my book

The Court—Then, if your statements are contradictory, it will so appear He meant what he said

Mr Hough *Q*—What I read, as well as what Mr Scofield read? *A*—Yes

Q—Were you discussing under the head "Habitual Use of Alcohol," alcohol as an alcoholic beverage, or alcohol in medicines, on page 419 of your book? *A*—Any way in which it might be used habitually

Q—Either way? *A*—Either way

Whereupon the further hearing of said cause was adjourned until 10 30 o'clock the following day, May 11, 1916

May 11, 1916, Morning

TESTIMONY OF DR PAUL N LEECH

The court met pursuant to adjournment Dr Paul N Leech was again called as a witness for the defendants

DIRECT EXAMINATION BY MR T J SCOFIELD

Mr T J Scofield stated that Dr Leech was called to connect up a point overlooked when he was on the stand before Dr Leech testified that he sent samples of his synthetic preparation to Dr Loevenhart at Madison, Wis, on December 10 This was the formula of which he spoke in his previous examination

CROSS-EXAMINATION BY MR HOUGH

Q—What date was that Doctor? *A*—On or about the 10th of December I could supply the date accurately probably this afternoon, if you so desire

Q—You think it was last December? *A*—I know it was last December and know it was within five days of the 10th

Q—At that time you had learned the chief ingredients of Wine of Cardui from a faithless employee of the Chattanooga Medicine Company, who was then in the employ of the American Medical Association, hadn't you? *A*—I learned the chemical ingredients of Wine of Cardui solely upon my own knowledge.

Q—Didn't you learn it from that faithless employee? *A*—In the first place I do not know to whom you refer, Mr Hough

The Court—Better give the name, perhaps he may recognize the name

Mr Hough *Q*—Do you know Dr Bicknell? *A*—I have never met or seen Dr Bicknell to my knowledge I have read Dr Bicknell's article as it appeared in Harper's Weekly, but before it appeared in Harper's Weekly I was making synthetic preparations of Wine of Cardui

Q—You are in the employ of the American Medical Association? *A*—Yes, sir, I am in the employ of the American Medical Association

Q—You know that Dr Bicknell came here and went into their employ, don't you? *A*—I have not the slightest intimation of such a thing

Q—Didn't you see Dr Bicknell up here in Chicago? *A*—As I said before, I do not know Dr Bicknell I have never seen Dr Bicknell, nor do I know a thing about it

Mr T J Scofield—I want to say this, if the Court please, that Dr Bicknell is not in the employ of the American Medical Association

Mr Hough—I know he is not now

Mr T J Scofield—And never was at any time, or under any circumstances, or for any purpose

Mr Hough—Counsel will perhaps give us the evidence as to what he was doing up here with the Association

Mr T J Scofield—When?

The Court—You don't have to put in any evidence We never heard of Dr Bicknell before. Let us wait until something is said about it from the witness stand

Mr Hough—I don't want Judge Scofield to testify all by himself

Mr T J Scofield—Judge Scofield is speaking truthfully about it, and will testify if it be required or necessary

TESTIMONY OF DR. L E WARREN

Dr L E Warren again was called as a witness for the defendants

DIRECT EXAMINATION BY MR T J SCOFIELD

Mr Scofield announced that Dr Warren was called to connect up some points previously mentioned Dr Warren testified that he purchased in the open market a bottle of Wine of Cardui which was sent in the original carton under seal He made a memorandum by writing his name on the outside carton A similar package was sent to Dr Ralph Webster

CROSS-EXAMINATION BY MR HOUGH

On cross-examination the witness stated that it was his belief that the bottle sent to Dr Loevenhart was manufactured since 1906 It was his belief that the bottle sent to Dr Webster was manufactured subsequent to 1909 He was then handed a carton containing a bottle and stated that as far as he knew the carton was identical to that sent to Drs Loevenhart and Webster He marked this carton with his initial He did not open the cartons sent to Drs Loevenhart and Webster to look at the bottle. There was then handed to the witness the bottle from the carton which he had identified He stated that he could not state whether the label on this bottle was identical to that taken from previous bottle He was asked in detail concerning each statement on the labels He did not state positively regarding any of the statements whether they were on the labels of the bottle before mentioned He marked this bottle for identification

TESTIMONY OF DR ARTHUR J CRAMP

Dr Arthur J Cramp was again called to testify for the defendants

DIRECT EXAMINATION BY MR T J SCOFIELD

There was shown to Dr Cramp a clipping from *Collier's Weekly* for June 8, 1912 He stated that he had endeavored recently to obtain a copy of that issue but was unable to do so Mr Scofield wished to offer the clipping in evidence Objection was made and sustained after argument There was then shown to the witness the Cardui Fashion Magazine The witness stated that he believed that it was printed subsequent to 1909, as it contained testimonials dated October and December, 1909 There was then read into evidence an advertisement from page 4 of the Cardui Fashion Magazine

Dr Cramp then identified a bottle of Wine of Cardui stamped No 6, 1915 He stated that the serial number A 171 indicates that it was made or put out subsequent to the change from the corporation to co-partnership on the part of the company There was then handed to him a bottle of Wine of Cardui which he stated was put out previous to the other bottle because the alcohol percentage was not declared and the serial number was not on On the first bottle was printed "for menstrual disturbances of women," on the earlier bottle "recommended for menstrual disturbances of women" These bottles were offered in evidence as exhibits Dr Cramp then identified a bottle which he purchased in the open market in 1913 He opened the carton, retained the carton in the Propaganda Department floated off the labels from the bottle, put on his own label stating what was in the bottle, and turned it over to the laboratory for analysis

CROSS-EXAMINATION BY MR. HOUGH

On cross-examination, the witness again gave the facts concerning the bottles mentioned in the direct examination and stated that when Dr Warren commenced to analyze the preparation, he was told that it was Wine of Cardui

STATEMENT BY MR SCOFIELD

Mr Scofield asked to strike out from the examination of Dr J Clarence Webster a statement containing the quotation "will cure falling of the womb in all its forms" as there was an error in putting on the quotation marks

Mr Scofield then introduced as evidence two photographs of billboard exhibits, used by Wine of Cardui Company Objection was made, overruled and exception taken

TESTIMONY OF MR EDMUND ALBERT WHEATLEY

Mr E A Wheatley was called as a witness for the defendants

DIRECT EXAMINATION BY MR T J SCOFIELD

Mr Wheatley stated that he is the advertising counsel of the Chattanooga Medicine Company and the advertisements were under his direction He was asked how many billboards his company has which are 7 by 9 feet in size, similar to those shown to the jury

Mr Hough objected to this as irrelevant, calculated to confuse the issue and is not an issue in this case

THE COURT —There is one very well defined charge here, and that is that the business is founded on fraud

Mr Hough —On deceit is the language

THE COURT —Well, deceit

On the question of the admissibility of this witness' evidence as to the extent of the plaintiff's advertising of Wine of Cardui Mr Hough argued to the effect that it was not open to the defendants to bring evidence on the point that the business had been built upon deceit except such as might be introduced under the general charge that the business was a fraud, as based on specific facts stated in the argument The defendants were entitled to introduce evidence only on those specific statements of fact contained in the libel which were set out in the plaintiff's declaration and which had been read into the plea of justification

THE COURT —How could you specify generally a combination of events from which possibly a conclusion might be drawn that the business was built upon deceit? Would you have to, in your plea of justification, set out every single link in the chain and say ‘from this we draw the conclusion that the business was built on deceit?”

Continuing his argument Mr Hough replied to the Court that the difficulty of stating the necessary specific facts was indifferent and this necessity was incumbent on the defendants who must state the facts as distinguished from the conclusions that they would draw from them If they could not state the facts then they could not justify at all and no evidence would be permissible under the general charge Mr Hough having admitted on behalf of the plaintiff, without conceding that it was an issue in the case that he had advertised Wine of Cardui as extensively as he could, Mr Wheatley was allowed to leave the stand without testifying

Mr T J Scofield read from page 7 of the Ladies' Birthday Almanac of 1912 the almanac that is copyrighted and published by the Chattanooga Medicine Company

Two pictures of the Exhibit of the defendants at San Francisco were introduced as defendants' Exhibit Nos 78 and 79 and objected to by counsel for the plaintiff on the ground of immateriality The Court overruled the objection but preserved the exception

TESTIMONY OF DR. S W LEATHERS

Dr Leathers was called to the stand for the defendants Before this witness evidence was taken the Court intimated that it was disposed at this point to limit further expert evidence on the ground already covered The defendants' counsel explained that Dr Leathers was called to testify in reference to the relation existing between pellagra, hookworm and amenorrhea

Mr T J Scofield —I think the suggestion made by your Honor is rather unfortunate for us and particularly when we have been perfectly willing to reduce the number of expert witnesses which the rule allowed us to produce. I grant that this case has taken much time, but it has not been on our account, and if the record is examined here with care you will see that and that—

THE COURT —It may be the Court's fault

Mr T J Scofield —The cross-examination in this case has extended—I am not going to say for an unnecessary length

After some discussion out of the hearing of the jury the Court suggested that defendants should stop, on the understanding that the plaintiffs would not put on a greater number of experts than the former had called

On this the defendants rest their case

The jury was excused until the next day and adjournment was taken until 2 o clock p m , of the same day

(To be continued)

Correspondence

The Hospital Chemical Laboratory

To the Editor —In a comparative study of hospital laboratories recently made by the writer, it became apparent that our present system provides but inadequately for the modern requirements of chemical routine and research in such institutions In course of time the necessity for modern pathologic, bacteriologic and serologic laboratories has become so fully recognized that certain hospital laboratories devoted to these divisions of the medical sciences would do credit to a medical university But little attention, however, has been as yet given to the development of the hospital chemical laboratory This is probably due to the fact that the rise of biochemistry is as recent as it has been rapid, the result being that its importance in clinical medicine is only at present attaining full recognition Thus it is only but a comparatively few years ago that a physician of some experience in general laboratory technic could be expected to carry out adequately the chief chemical examinations required of the hospital laboratory The number of chemical examinations of clinical importance has steadily increased to the extent that this work now represents a large percentage of the total required of the hospital laboratories Again, in some instances the analytic procedures have become of such complex nature that physicians with their necessarily generalized scientific training cannot properly be held responsible for accurate results without undue sacrifice of time and energy Moreover, an increased amount of working space and apparatus is contingent to this augmentation in the chemical work of the modern hospital These reasons, if briefly stated, may be regarded as sufficient to justify the presence in a large hospital of an adequately equipped chemical laboratory in charge of an experienced biochemist

There are, however, various other grounds for encouraging the building up of such laboratories Present day teachers and research workers in biochemistry are often beset by a certain onesidedness in their points of view and attainments This tendency may incline either medically or chemically, but usually the chemical side predominates The underlying cause of these difficulties is that it is by no means easy to acquire the ideal blending of chemical and medical experience most desirable for biochemists The man of pure chemical training has far too few opportunities in the narrow confines of the university department of physiologic chemistry to acquire the needed balance of clinical experience On the other hand, the physician entering into a biochemical career often lacks the necessary chemical training If, however, our large urban hospitals possessed biochemical laboratories in charge of men of proper experience, no more ideal training could be afforded future workers in biochemistry than one obtained in such an environment Here both the young chemist and the physician working in such a laboratory could acquire sufficient mutual experience in these branches to assure of an even future development

Again, among the large collections of patients in our hospitals many important and interesting research problems constantly present themselves, often only to remain unsolved for want of an experienced biochemist to undertake them Many of such questions cannot be hopefully attacked by clinicians for want of sufficient chemical experience These problems may likewise escape the attention of the university biochemical department In this lies an additional reason for the existence of hospital biochemical laboratories

The necessity of such a development having been emphasized, a few remarks as to a suitable organization may be added The chief difficulty here to be encountered is the great scarcity of men in America sufficiently experienced in both medicine and chemistry to make ideal directors of such laboratories In hospitals affiliated with universities however, the director of the chemical laboratory might hold an assistant or associate professorship in the teaching institution Such an arrangement would permit of medical and biochemical students doing chemical research work in the hospital laboratory, and thus become of distinct advantage in their training The minor positions in the laboratory can best be occupied by young chemists Medical men connected with the hospital should, however, be encouraged to undertake research problems of chemical nature

There is a frequent tendency to place too great control of the activities of hospital laboratories into the hands of the clinical staffs In view of the modern development of medicine and its scientific branches, this course cannot but be followed by detrimental results Perhaps the most judicious relation which can be proposed for the clinicians and biochemist would exist, if to the former were to be confined the seeking for and propounding of research problems, and to the latter the choice and solution of those suitable for chemical study

With regard to the physical aspects of the hospital chemical laboratory, the following may be suggested Even if available working space be limited, an effort should be made to give those workers engaged purely in research, room separate from that devoted to routine The proper equipment of such a laboratory requires considerable judgment and experience but a discussion of the technical details cannot be here entered into A very essential adjunct is an experimental ward devoted *solely* to patients undergoing metabolic study Complete segregation and constant control of such patients is indispensable for work of any value If extensive studies are to be carried out, a specially trained dietitian is required in addition to nurses experienced in this kind of work Proper provision for animal experimentation is seldom made in the modern American hospital The actual requirements in this regard for the chemical laboratory are, however, usually but modest A single room provided with metabolic cages frequently suffices even for a busy laboratory

Finally, a working library should be regarded as essential in any completely equipped hospital laboratory in which serious research is attempted A comparison of American and German hospitals strikingly illustrates the lack of such libraries in most hospitals in this country This cannot always be ascribed to the usual excuse of shortage of funds, for $1,000 is quite sufficient to acquire a very useful nucleus of books and journals in any one of the medical sciences

Nelson W Janney, M D, Ph D, New York
Physiological Chemist of the Montefiore Home and Hospital for Chronic Invalids

Efficiency of the Rectal Examination in Obstetrics

To the Editor —The value of a rectal examination in a normal obstetric case has been emphasized by several writers The efficiency of the rectal examination is shown by the statistics from the outpatient department of the Presbyterian Hospital and Rush Medical College, where the standing order to students has been, no vaginal examinations after the fifth month During the last six years there have been over 4,000 deliveries with but two cases of puerperal sepsis, and these two were cases in which vaginal examinations had been made by the same attending man in each case, and episiotomies done with subsequent infection of the episiotomy sutures When we consider that these deliveries have been made in homes of the Ghetto district under insanitary conditions by students under supervision, the results seem worth while

The method of making a rectal examination is not complicated The gloved finger is carefully introduced into the rectum, following a recent enema, and, avoiding the almost constant hemorrhoids, the os is sought When the edge of the ring is found, the finger is swept around to determine the amount of dilatation Then the cervix is palpated to determine the amount of effacement and consistency The sagittal suture and fontanel, or fontanels, can be located, depending on the amount of dilatation of the os Palpation of the outlet is easily done A marginal or central placenta praevia is easily palpated A forelying or prolapsed cord may be found and, in short, almost any condition be ascertained as in a vaginal examination, with the exception of the best pelvic measurement we have—the conjugata vera The distance of the head is measured in terms of phalanges, so that an intern, an obstetric nurse or a gas anesthetist, reporting a case, may say "1, 2 or 3 phalanges away," as the case may be

The rectal examination takes less time than to prepare a patient surgically for a vaginal examination, it is less obnoxious to her, and it may be frequently repeated without danger of infection This is advantageous in cases of contracted pelves, as there arises no contraindication to cesarean section from repeated vaginal examinations If the patient develops a rise of temperature after delivery, the physician has no reason to reproach himself

Recently there was a case of thrombophlebitis in a well known obstetrician's patient It was a source of considerable satisfaction to him that no vaginal examination had been made since the fifth month

While a rectal examination is aseptic, it is at least debatable whether a vaginal examination may be made aseptic Nevertheless the remark is frequently made, "I use vaginal examinations entirely, and have no cases of puerperal sepsis Why should I change to the use of rectal examinations?" The answer to this question is that many cases of low grade salpingitis are ignored by the accoucheur A temperature of 100 or over on the third or fourth day does not always mean "lactation", pains in the lower quadrant of the abdomen from the sixth to the fourteenth day do not always mean "constipation," or "muscular rheumatism," or "neuralgia All of these phenomena often indicate a low grade salpingitis or pelvic peritonitis This low grade salpingitis or pelvic peritonitis so contracted is just as important a focus of infection as the tonsils, sinuses, teeth and other foci of chronic infection It seems more reasonable to suppose that the atrium of infection in a parous woman with nonsuppurative salpingitis is chiefly from her obstetric experiences, rather than distant foci in the body

A MINOR NOTE IN A DIFFERENT KEY

To the Editor —I thank you very much for your kind letter of sound advice and deserved criticism of my article I can now see that I did stray away from the point that I should have centered my article about and that it hence was lacking that most essential element, complete coherence I am sure that all authors, and particularly the young ones such as myself, must appreciate the policy of The Journal in thus giving counsel and pointing out mistakes The writer is so liable to be blind to his own errors

A B C

Ignorance of Anatomy —It is shameful for man to rest in ignorance of the structure of his own body, especially when the knowledge of it mainly conduces to his welfare, and directs his application of his own powers —Melancthon

ARTICLES OF AMALGAMATION

Between the University of Pennsylvania and the Medico-Chirurgical College and Hospital

The Medico-Chirurgical College and Hospital shall become the Medico-Chirurgical College and Hospital, Graduate School of Medicine of the University of Pennsylvania

The following clinical professors of the medical department of the Medico-Chirurgical College—eight in number—shall automatically become members of the faculty of the Medico-Chirurgical College, Graduate School of Medicine, with the rank of full professors James M. Anders, Ernest Laplace, W Easterly Ashton, L Webster Fox, George M Boyd Judson Daland, E B Gleason, George E. Pfahler

The following scientific professors of the medical department of the Medico-Chirurgical College—five in number—shall at once be elected professors in the undergraduate school of medicine in the University of Pennsylvania with the same rank title and salary as they now have Seneca Egbert, John C. Heisler, Joseph McFarland, George H Meeker Horatio C Wood, Jr

Under the charter and statutes the ultimate control of all teaching in the University is vested in the Board of Trustees—subject to such control and subject to the terms of donations endowments made or to be made, the teaching of medicine and surgery to graduate students shall be under the direction of the Faculty of the Medico-Chirurgical College and Hospital, Graduate School of the University of Pennsylvania

No future amalgamation between the university and any institution now existing shall operate to create within the university a similar but independent school for graduate teaching in medicine and surgery

In any such case the graduate teaching in such school shall be done by this faculty as now composed or as from time to time constituted by action of the board of trustees

The age limit prevailing in the University of Pennsylvania shall not be operative in the case of the professors who come in from the Medico-Chirurgical College until at least five (5) years from the time the new graduate school is built and opened for instruction

The trustees of the university shall provide a new hospital containing 200 beds for ward patients and not less than 50 private rooms and a nurses' home The hospital shall include on the staff or faculty a professor of biologic chemistry and a professor of physiology, pathology, and bacteriology and shall provide for them well-equipped and thoroughly organized laboratories There shall also be a Roentgen-ray and electrotherapeutic laboratory and a department of physical therapeutics

That there may be no interference with the hospital facilities now enjoyed by the clinical professors of the Medico-Chirurgical College, the new hospital shall be completed and organized before the present hospital is vacated, unless the city should in the meantime take possession of the property

Subject to the agreement of merger with the Evans Dental Institute the dental school of the Medico-Chirurgical College shall merge completely in the dental school of the University of Pennsylvania its faculty becoming a part of the dental faculty of the University of Pennsylvania, and the student body uniting with the student body of the university

The following dental professors of the Medico-Chirurgical College shall be elected professors in the dental school of the university with the same rank, title and salary as they now have I. Norman Broomell, R. Walter Starr, L. Ashley Faught.

The School of Pharmacy of the Medico-Chirurgical College may become a distinct branch of the University of Pennsylvania to be known as the department of pharmacy and J W Sturmer shall be elected a professor in the department with the same title and salary as he now has

The University of Pennsylvania shall carry out all contracts and obligations entered into with students who are registered in the Medico-Chirurgical College at the time the merger is accomplished The trustees shall recognize new students who have registered and admit them to the university without further examinations Students who have passed their examinations and who present certificates from their respective deans shall be admitted to advanced standing in the university without formality and given a diploma in course.

The graduates of the Medico-Chirurgical College shall be eligible to membership in the corresponding alumni societies and also in the general alumni society

All assets, property and endowments held by the trustees of the Medico-Chirurgical College and Hospital corporations shall pass in absolute ownership to the corporation of the University of Pennsylvania, to be held as a separate fund and used exclusively for buildings development and maintenance of the Medico-Chirurgical College and Hospital, Graduate School of Medicine of the University of Pennsylvania

Representation of the Board of Trustees of the University of Pennsylvania shall be given to the Medico-Chirugical College if possible

Teaching in the Medico-Chirurgical College shall end with the present session of 1915-16 and the university trustees shall take immediate steps to transfer the professors and students of the Medico-Chirurgical College in accordance with the articles of amalgamation

The Alumnae of the Nurses Training School of the Medico-Chirurgical Hospital shall become members of the reorganized alumnae association of nurses of the Medico-Chirurgical College and Hospital, Graduate School of Medicine of the University of Pennsylvania

Book Notices

Harvey's Views on the Use of the Circulation of the Blood By John G Curtis, M D, LL D Based on a Lecture Delivered in 1907, before the Johns Hopkins Hospital Historical Club at Baltimore Cloth Price, $1 50 Pp 194, with illustrations New York Columbia University Press, 1915

This interesting book was published after the death of the author, and the final touches necessary for publication have been supplied by Prof F S Lee The book represents a large amount of scholarly work, and as pointed out by Lee is a more profound study of Harvey's ideas, as compared with the ideas of his most important predecessors, than has heretofore appeared Lee says "It is the work of one who from the background of the physiological science of today delighted in mastering the ideas of the fathers of modern physiology If his work is to be summarized in a single sentence, it may be said that he has shown Harvey to be a disciple more of Aristotle than of Galen Although Harvey had the courage and the originality to break away from him whose ideas had prevailed for fourteen centuries, and to find the truth in regard to the movement of the blood, he found much to approve in the master who had lived five hundred years before Galen Harvey's true position in the world of physiological thought has not before been known Herein lies Professor Curtis' contribution to the history of his science"

The Mortality from Cancer Throughout the World By Frederick L Hoffman, LL D, F S S, F A S A, Statistician, The Prudential Insurance Company of America Cloth Gratis Pp 826 Newark, N J The Prudential Press, 1915

So far as we know to the contrary this book represents the most complete study of the incidence of cancer yet published The literature on cancer statistics has been thoroughly reviewed, and figures are supplied on cancer in every aspect There are 220 pages of the book devoted to a discussion of the results The remainder, about 600 pages, contains charts and appendixes quoting actual statistics of cancer as it occurs in practically every part of the world where such studies have been made Special appendixes are devoted to the recommendations and instructions of various societies for the control of cancer, and about twenty pages to a bibliography The book is exceptionally worth while, and the Prudential Life Insurance Company is to be congratulated on the spirit that prompted the financial outlay involved in its production

Practical Physiological Chemistry A Book Designed for Use in Courses in Practical Physiological Chemistry in Schools of Medicine and of Science By Philip B Hawk, M S, Ph D, Professor of Physiological Chemistry in the Jefferson Medical College of Philadelphia Fifth Edition Cloth Price, $2 50 net Pp 638, with illustrations Philadelphia P Blakiston's Son & Co, 1916

The fifth edition of this book contains several new chapters on nucleic acids and nucleoproteins, on gastric analysis, on intestinal digestion, on blood analysis and on metabolism It offers a short, concise treatment of physiologic chemistry and is well adapted for use in schools One of its best features is that it serves as a laboratory manual, the numerous experiments which it describes are well chosen

Medicolegal

Diagnosis and Treatment of Fractures as Sprain

(Nickerson vs Gerrish (Me), 96 Atl R 235)

The Supreme Judicial Court of Maine overrules a motion for a new trial after a verdict for $5,000 damages was returned in favor of the plaintiff on condition that he remit all of the verdict in excess of $3 000 The court says that the plaintiff, in walking in a railroad roundhouse, January 5, stepped unawares into an ash pit about 3 or 4 feet deep striking his full weight on his right foot flat on the brick bottom of the pit and thereby fractured both bones of his right leg the fibula and tibia, about 3 inches above their lower ends About eight hours afterward he was attended by the defendant who diagnosed his injuries as a sprain and administered treatment accordingly Subsequently the defendant visited him six times, the last visit being January 14 or 15 At that time the plaintiff was on crutches and suffering considerable pain, but, at his suggestion that he wished to get back to his office the defendant advised that he might do so The defendant did not see the leg again until February 4 when the plaintiff called at his office, and it was 'obvious to the eye' that there had been a fracture as the result of the accident. The defendant did not, however, inform the plaintiff of that fact, or then propose any treatment to reduce the fracture, but advised him to have the leg massaged and report in three days On the evening of the same day, the plaintiff consulted another physician, and a roentgenogram of the leg was taken The next day the defendant was paid for his services and discharged from the case There was considerable testimony of physicians, on the one side and the other as to the difficulty of diagnosing injuries to the lower leg or ankle, and as to the methods of examination for such injuries and the relative utility of the different recognized tests which are used to detect fractures in the lower leg or ankle But, while that testimony was not altogether in harmony, it disclosed a consensus of opinion that there are certain recognized methods of examination or tests to be used when the nature of such injuries is not obvious but hidden and difficult of diagnosis That the defendant was perfectly familiar with all the methods and tests recognized by the profession to be used in such examinations and understood their relative usefulness was conceded He concluded that it was unnecessary in the plaintiff's case to have a roentgenogram taken of the leg, or to etherize the patient, and he relied on his manipulation of the injured parts and his examination for deformity or other possible indication of fracture, as affording him sufficient information on which to base his diagnosis He made a mistake, however, and his diagnosis was wrong But that fact alone was not sufficient to render him liable. Something else must be shown And the issue before the jury in this case necessarily was whether that mistake was the result of a failure of the defendant to use painstaking care and diligence, and to exercise the best of his admitted learning skill and judgment in his examination and treatment of the plaintiff's injuries That issue the jury found in the plaintiff's favor A physician impliedly agrees with his patient that he possesses that reasonable degree of learning and skill in his profession which is ordinarily possessed by other physicians under like conditions, that he will use his best skill and judgment in diagnosing his patient's disease or ailment and in determining the best mode of treatment, and that he will exercise reasonable care and diligence in the treatment of the case

Perforating Lining of Bladder—Abandoning Case

(Burnett vs Layman (Tenn) 181 S W R. 157)

The Supreme Court of Tennessee reverses a judgment entered on a directed verdict for the defendant, and remands the case for a new trial The action was for alleged malpractice The court says that the plaintiff was being treated for a bladder trouble, and it was thought necessary by the defendant to sound the urethra In the performance of this operation there was some evidence tending to show that the lining of the bladder was "pocketed" or perforated by the sound A physician does not guarantee the cure of his patients Presuming a careful diagnosis, a physician is not liable for damages resulting from an honest mistake in determining on the character of treatment to be administered, or in determining on the necessity of an operation These things are mere matters of judgment on which an action for damages cannot ordinarily be predicated While it is sometimes difficult to distinguish between negligence and an error of judgment, it may be said, generally speaking, that in performing an operation the physician is employing surgery as an art, and he is liable for negligence in operating So in this case, while the defendant could not be held liable for an error of judgment in determining on the sounding operation he was liable for any negligence in the actual performance thereof Some of the evidence introduced for the plaintiff indicated that the defendant did not exercise the care which an ordinarily prudent physician should have employed in his manner of using the sound In fact, in the absence of any explanation whatever from the defendant, it might have been inferred by the jury that the lining of the bladder would not have been perforated if due care had been used

Another count of the declaration sought to hold the defendant liable on account of his abandoning the case, and the court thinks there was evidence to sustain this count It appeared that when this sound was introduced the plaintiff heard something pop, and the withdrawal of the sound was followed by a flow of blood and pus The defendant appeared excited announced that he was no surgeon, and told the plaintiff that he must procure a surgeon The defendant then hurriedly left, without any effort to relieve the plaintiff or to administer to him further The plaintiff did not procure another physician until the next day or day thereafter It is well settled that a physician who undertakes the treatment of a case may not abandon his patient until in his judgment the facts justify the cessation of attention, unless he give to the patient due notice that he intends to quit the case and affords the patient opportunity to procure other medical attendance What is fair notice to a patient depends on the circumstances of each case. In this case the plaintiff appeared to have been suffering greatly, bleeding, and in need of immediate attention when the defendant abandoned him Certainly the defendant should have done something in this pressing case to have relieved the distress of his patient. The court thinks the defendant was liable for his conduct He should have remained with the plaintiff until immediate sufferings were relieved, or until another physician had been secured

Contract with Health Officer to Treat Cases Against Public Policy

(Town of New Carlisle vs Tullar (Ind) 110 N E R 1001)

The Appellate Court of Indiana, Division No 1, reverses a judgment for $362.22 obtained by plaintiff Tullar against the town for professional services rendered and medicines furnished in treating certain smallpox cases The plaintiff contended that he was first employed as a physician to treat the cases and was later in the same day appointed to and accepted the position of health officer of the town, the salary of which was $15 a year The court holds that the principle of public policy was involved, and that therefore the alleged contract under which the services were rendered was void if entered into after the plaintiff accepted the position of health officer and if entered into before he became such health officer and the services were rendered while he was such officer, the contract was thereby rendered invalid, and its enforcement would be against public policy Whether the contract was entered into shortly before, at the time or after the plaintiff's appointment as secretary of the board of health was not material, for it was not disputed that he rendered the services while acting in his official capacity as health officer However, the alleged contract did not come within the letter of the Indiana statute which prohibits officers from being interested in public contracts But whenever a public officer enters into a contract, the e[illegible]tion of which may make it possible for his personal interests to become antagonistic to his faithful discharge of public duty, such contract is held void on the ground that it is against public policy The secretary of a board of health in his official capacity owes high and important duties to the public His responsibiliy not only involves the health and sanitary conditions of the citizens generally, but in determining when it is necessary to act and the nature and extent of the measures to be employed he necessarily determines questions which reach and affect the public treasury When measures have been taken and treatment given at the expense of the public, he is charged with general supervision and must likewise determine when such measures or treatment may safely be discontinued The services for which a recovery was allowed in this case continued throughout the month of March The plaintiff's duties as health officer were continuous throughout that time The determination of the necessity for the continuation of the services at the expense of the municipality during that time was a question that devolved on him in his official capacity Whether he acted honestly and in good faith was not material to the question under consideration The question depended, not on what was actually done under the contract, but on what was made possible thereby Recovery for such continued services could not be sustained on the ground of emergency Cases dealing with emergency have been duly considered, but are not of controlling weight here, though they have application to many situations which arise in relation to public health

Insufficient Evidence of Wife Promising to Pay Physician

(Vernaglia vs Cirota (N Y), 156 N Y Supp 432)

The Supreme Court of New York, Appellate Term, First Department, reverses a judgment obtained by the plaintiff, and grants the defendant a new trial, with $30 costs to the defendant to abide the event The court says that the plaintiff, a physician, sued the defendant to recover the alleged reasonable value of professional services rendered to her husband at the joint request of the defendant and her husband, who had since died It is well settled that the performance of services by a physician for a third person at the request of another gives rise to no implied promise to pay for the services by the person making the request, unless the relationship of such person to the plaintiff be one which imports a legal obligation to provide them In order to support such a liability of a person under no legal obligation to provide the services of a physician, there must be an express promise on the part of such person to pay for the services, made before the services are rendered The plaintiff recognized this rule, and that a wife is under no legal obligation to provide such services for her husband out of her own estate, but he relied on an alleged express promise of the defendant to pay for the services The evidence of such express promise by the defendant was the testimony of the plaintiff that at the time he commenced the services he had a joint conversation with the defendant and her husband, the patient, in which they said "Doctor, you are the one we have confidence in, and we want you to visit me, or the sick one, three times daily, and we will pay you for everything you do for us" He was asked to state exactly what each party said, and replied "They all talked They were both talking together I cannot separate them" The defendant denied that she made any statement in regard to payment for the plaintiff's services, and testified that there were several other physicians in the room, who were all talking in consultation, and she had nothing to say to any one Resolving this issue of fact most favorably to the plaintiff, the court is of the opinion that the testimony did not show an express promise by the defendant to be individually responsible for the debt Assuming that the wife said, jointly with her husband, "We will pay you for everything you do for us," the court thinks that under the circumstances here disclosed the "we" clearly referred to the family, and to the husband as the responsible head of the family In the absence of a separate statement by the wife, saying "I will pay you," or words to that effect, no express promise on the part of the wife to be personally liable for the physician's fees could be found

ASSOCIATION OF AMERICAN PHYSICIANS

Thirty Fourth Annual Meeting, held at Washington, D C, May 9 11, 1916

(Concluded from page 1886)

Treatment of Typhoid by Intravenous Injections of Sensitized Typhoid Vaccine Sediment

Drs Frederick P Gay and H T Chickering, Berkeley, Calif The majority of about seventy-five cases of typhoid were treated with intravenous injections of polyvalent, sensitized vaccine sediment The mortality was about the same as the best hospital normal, from 9 to 10 per cent Distinct benefit was seen in cutting short the disease Over 40 per cent of the cases were abortively cured, with normal temperature within a week after the first injection In 25 per cent more an early induced lysis was observed

DISCUSSION

Dr Louis M Warfield, Milwaukee, Wis Sixteen of the twenty-one patients treated with this vaccine recovered, two patients were cut short abortively, a man of 40 and a child, the man suffered a typical relapse which was uninfluenced by the vaccine The five deaths were due, two to pneumonia, two to hemorrhage and one to long continued toxemia The average duration of fever in this series was thirty-eight days, the same as in the prior series of unvaccinated cases The shortest vaccinated case was seventeen days, the shortest unvaccinated case, sixteen days The highest leukocytic crisis took the count to 42,000, and occurred five hours after vaccination Two impressions were gained 1 The general course of typhoid is milder after vaccination 2 The subjective symptoms are ameliorated

Dr Joseph L Miller, Chicago Nonspecificity of the reaction needs emphasis Ludke obtained as good results from the use of albumose as from vaccine I have seen as good results from the use of proteose Recently I saw remarkably quick recoveries from acute infections following the use of chicken serum In acute arthritis I have been able to induce very striking crises with injections of typhoid vaccine

Physical Signs and Symptoms of Wounds of the Chest

Dr C P Howard, Iowa City, Iowa This series comprised 107 cases, of which eighty-seven were thoroughly studied The wounds were produced by rifle or machine gun bullets (forty-five) or by shell, as shrapnel, high explosive, or hand grenade (forty-two) In Group 1 (fifteen) no signs could be found, in Group 2, either pneumonia (four) or simple serous effusion (two), in Group 3, mediastinitis, one case In Group 4 a hemothorax was found, which was either infected (nine cases) or noninfected (fifty-six cases) Infecting organisms varied Symptoms were cough, pain, hemoptysis of varying degree, and dyspnea There was usually fever The physical signs suggested consolidation rather than fluid, owing to the great compression of lung Cardiac displacement was often striking In eight cases there were unequivocal and in five others suggestive signs of pneumothorax In four cases pneumonia existed on the side opposite the hemothorax Secondary hemorrhage into the pleural cavity was rare (one case) Simple fibrinous pericarditis occurred in three cases, and a pneumopericardium in one Treatment consisted of free drainage in infected cases and of simple aspiration or of oxygen replacement Mortality was only 7 per cent in the entire series

DISCUSSION

Dr David Riesman, Philadelphia I have observed the same physical signs described by Dr Howard as occurring in hemothorax due to gunshot wounds in traumatic hemothorax without penetration They were left alone and got well by absorption

Anaphylatoxins

Drs F G Novy and P H DeKruif, Ann Arbor, Mich An anaphylatoxin is a toxic substance developed in an organism as a result of the introduction into that organism of any one of various things It is now possible to make in five minutes a constant anaphylactic poison which will kill a 250 gm guinea-pig immediately in a dose of 0.25 c c If agar serum anaphylatoxin is centrifugalized, it may be used without harm, after fifteen minutes it kills, and this may be repeated it is a true colloidal periodicity Normal serums are all deadly poisons if treated right Normal blood serum, which is harmless when freshly drawn into a syringe and for one or two minutes thereafter after three minutes always kills Rabbit's blood was divided into two portions, one part defibrinated by beads was harmless, another part defibrinated with a rod always killed If serum can be so influenced out of the body, why not in it? The answer was found in the production of a constant poison by the use of agar as antigen, but only when it was employed in a certain way

Various Proteose Intoxications

Dr. G H Whipple, San Francisco The relation of proteose intoxication to general peritonitis, acute pancreatitis and acute intestinal obstruction was made the subject of study The material used experimentally was obtained in cases of acute peritonitis and of acute pancreatitis the proteose was one precipitated by five volumes of alcohol Constant presence of this proteose in the organs concerned was noted in the processes studied, it was recovered from closed intestinal loops, from exudates in sterile peritonitis, and from the extracted pancreas in induced pancreatitis It was absent in controls A rise in noncoagulable nitrogen has been noted in the three conditions studied, induced peritonitis, pancreatitis and obstruction in dogs was followed by rapid rise of noncoagulable nitrogen It is assumed that this is due to destruction of body tissue by a toxic agent, namely proteose. It is concluded that the evidence leads to the idea that, in the three conditions mentioned, proteose intoxication plays a part.

The Food Problem in Dispensary Patients of Different Nationalities

Drs H R M. Landis and F A. Craig, Philadelphia The proper utilization of food has an important bearing on the prevention of disease notably tuberculosis Are the people getting the right kind and amount of food for their money? Are foreign born dispensary patients adapting themselves well to American market conditions? A study was made of four groups of families three Italian, three Jewish, three Negro and three Polish Daily inventories of their food supply were made for three weeks by a nurse, calories, waste and cost were estimated Adopting a standard calory value including 340 calories represented by protein, it was found that all the groups approximated the desired calory value in the food purchased but there was much variation in the protein content The cost per head per day was as follows Italian 19 cents, Jews, 21.5 cents Negroes 24 cents, Poles, 34 cents

DISCUSSION

Dr. S Solis Cohen, Philadelphia The caloric content is by no means representative of the true value of food especially of its dietetic value for tuberculosis The therapeutic value of food in tuberculosis depends on its richness in nitrogen rather than the other ingredients

Etiology of Pellagra

Dr. E. J Wood Wilmington N C. Corn is regarded as bearing the same relation to pellagra as is borne by rice to beriberi The correctness of this view is proved both by experiments on the pigeon and by evidence found in the literature of outbreaks of pellagra brought about by eating highly milled meal which were promptly corrected by feeding whole meal. The fault lies in two factors The first is the heating of the corn in kilns above 120 C., which is enough to destroy the vitamin The second is the removal of the fat-containing germ from the grain The remedy consists in feeding the victims the whole grain, and this plan is also prophylactic

DISCUSSION

Dr Joseph Sailer, Philadelphia I recently saw two cases in Philadelphia, both patients had lived in the city for thirty years, neither had ever used corn meal as food

Dr Nathan E Brill, New York I recently observed pellagra in a man who had not been outside New York City in twelve years and had never tasted corn meal in his life

Dr E J Wood, Wilmington, N C I have seen many pellagrins who have never eaten corn meal in their lives, but who nevertheless were relieved on being fed corn chops Wheat germ will probably act in the same way The very extensive use of baking powder and soda in the South may be a factor in the pellagra problem, these ingredients in bread may liberate enough sodium carbonate to destroy the vitamins in the best of grain It is a fact that the sudden appearance of pellagra in the South was coincident with the disappearance of the old fashioned water-power grist mill

Lipase in the Urine of the Tuberculous

Dr William Charles White, Pittsburgh The study was undertaken while seeking a key to the disappearance of fat in the tuberculous Little if any lipase is found in the urine of normal human beings, little, if any, in urine from afebrile tuberculous persons, progressing well, but there is a marked rise of lipase in urine from febrile tuberculous persons approaching death Lipase rises in the urine before and during fever in the tuberculous, and declines with defervescence

Leukemia, Lymphosarcoma and Hodgkin's Disease

Dr. C. H Bunting, Madison, Wis., and Dr. J L. Yates, Milwaukee, Wis Leukemia, lymphosarcoma and Hodgkin's disease have in common (1) a primary focus of infection, (2) progressive glandular enlargement, (3) a chronic course with late anemia and late fever, (4) eventual fatal termination, (5) early Hodgkin's blood picture or leukemia blood picture, and (6) all yield a diphtheroid organism The leukemic blood picture may appear in all the groups Shall we adhere to the classification of these diseases in three separate compartments, or shall they be regarded as variations of one process associated with the diphtheroid organism?

DISCUSSION

Dr. H G Wells Chicago In studying mice in the course of tumor work a lymphatic condition indistinguishable from leukemia in man has been repeatedly observed Nothing like lymphogranulomatosis or Hodgkin's disease has been found Mice which develop leukemia do not have tumors

Dr Theodore C Janeway, Baltimore Our understanding of these conditions is not advanced by claiming that a diphtheroid organism is always present, or by explaining contradictory findings on the basis of technical errors We have studied all sorts of lymph nodes without the finding of the diphtheroid organism with any degree of constancy

Dr. Frank Billings, Chicago In forty-odd cases of Hodgkins's disease and other lymphatic diseases the diphtheroid organism was recovered from the lymph nodes in all except two But the same organism has been found in goiters in joints, in tuberculous glands, etc., so that I am inclined to the belief that it is a parasitic organism accidentally present in pathologic tissue. Animal experiments with the organism have not indicated any specificity and I do not believe it has any etiologic relation to the lymphatic diseases

Renal Function in Serum Disease

Drs W T Longcope and F A. Rackemann New York With a constant salt-containing food the sodium chlorid water and phenolsulphonephthalein output were measured Just as water and sodium chlorid output are diminished in pneumonia, so in eight of ten cases of serum disease there was a similar diminution, with salt retention in the tissues The salt and water were liberated during convalescence In another type (without edema) there **was no** salt retention and the administration of salt caused diuresis Thus serum disease may act in two ways

Occurrence of Living Tubercle Bacilli in a River Contaminated with Sewage from a Health Resort

Drs Lawrason Brown, S A Petroff, and F H Heise, Saranac Lake, N Y In 90 per cent of cases of open tuberculosis, viable tubercle bacilli may be found in the feces The Saranac Lake River is contaminated with sewage from Saranac village, the water was studied, samples being collected at various depths and distances Acid fast organisms were found in all specimens taken below the sewer outfall, except in two taken below the surface of the stream It was impossible to infect guinea-pigs with water taken 5 miles down stream Guinea-pigs could be infected with specimens taken 2½ miles down stream on cloudy days, but not with specimens taken on sunny days No acid fast bacteria were found in the water taken above the sewer outfall

Polycythemia Treated with Radium

Dr Joseph Sailer, Philadelphia After the usual therapeutic measures had been exhausted, radium was carefully employed The spleen greatly reduced in size, after four months, the red cell count dropped from 7,621,000 to 5,674 000 Lately the subjective symptoms have disappeared, and the patient has become a fairly active woman When the treatments are suspended, symptoms recur

DISCUSSION

Dr Max Einhorn, New York I saw a case of this kind a year ago in a man whose cells numbered 6,500,000, his principal symptom was dyspnea He had sought to increase the fluids of the body and so dilute the blood by taking a quart and a half of milk daily The symptoms were much improved by this simple expedient

Bile Content of the Blood in Pernicious Anemia

Dr M A Blankenhorn, Cleveland While the nature of jaundice in pernicious anemia was being investigated, the observation was made that many patients, although distinctly jaundiced, showed no bile in the urine The blood plasma, however, in every such case showed a corresponding jaundice These plasmas, when presenting a jaundice of a certain intensity, all gave a positive test for bilirubin Urobilin was found in the plasma of none There was often found a higher concentration of bilirubin in the plasma, coincident with the absence of bile in the urine, than is found in the plasma of patients with certain lesions of the liver which are always characterized by bile in the urine Bile salts were found in the plasma in ten out of thirteen cases The cases showing the highest concentration of bilirubin in the plasma were those showing evidence of the most active blood destruction The cases showing the highest concentration of salts were those in which nerve lesions predominated

Some Blood Pressure Phenomena in Exophthalmic Goiter

Dr A E Taussig, St Louis The vascular abnormalities in exophthalmic goiter are analogous to those in aortic regurgitation Blood pressure changes follow the same course Pulse pressures are high as compared with low or normal diastolic pressures As in aortic regurgitation, so in exophthalmic goiter the blood pressure in the thigh is higher than in the arm, there being a difference of from 22 to 56 mm In nontoxic goiters, as in normal persons, the arm and thigh pressures are equal The diagnostic value of this inequality of arm and leg pressures is doubtful, but it may be useful in distinguishing between toxic and nontoxic goiter

Function of the Thyroid, Normal and Abnormal

Dr H S Plummer, Rochester, Minn The function of the thyroid is to furnish a hormone for the control of tissue metabolism Hypothyroidism and hyperthyroidism are fluctuations in the reactions of tissue metabolism control As to pathologic changes, inflammatory changes may stimulate hyperactivity of the gland Both major and minor stimuli may lead to goiter Normal stimuli overdone may lead to colloid or hyperplastic changes Hypertrophy and hyperplasia may coexist, but it is doubtful if dividing cells can function The evolution of hyperplastic and colloid goiters is discussed The normal products of the thyroid are colloid and the hormone alpha-iodin of Kendall Overactivity of metabolism is a manifestation of hyperthyroidism and depends on the thyroid hormone as to every tissue of the organism

The Active Constituent of the Thyroid

Dr E C Kendall, Rochester, Minn Investigation of the alpha-iodin compound, isolated from the thyroid, has shown that it possesses the characteristic activity of the gland and is its active constituent Its isolation in pure crystalline form has been perfected, and preliminary experiments suggest that its function is concerned with the metabolism of amino acids

Pathologic Changes in the Sympathetic System in Goiter

Dr Louis B Wilson, Rochester, Minn We made a study of cervical and other sympathetic ganglia removed at operation and necropsy from patients with goiter, the results being controlled by a study of ganglia from nongoitrous patients Sections of the ganglia, stained by various methods, show extensive histologic changes, consisting of various stages of cell degeneration, namely, (*a*) hyperchromatization, (*b*) hyperpigmentation, (*c*) chromatolysis and (*d*) atrophy or (*e*) granular degeneration So far as may be determined from the small number of specimens examined (twenty-five cases), the pathologic changes in the ganglia are parallel to the stage and intensity of the symptoms of hyperthyroidism and to the hyperplastic and regressive change in the thyroid

Pancreatic Changes in Latent Syphilis

Dr A S Warthin, Ann Arbor, Mich The histologic study of the material from seven necropsy cases of diabetes showed, in all, syphilitic lesions in the myocardium and aorta The presence of spirochetes was demonstrated in five cases In all of these cases marked changes were found in the pancreas of the nature of interstitial pancreatitis, both interlobular and intra-acinar This led to the study of the pancreas in a large number of other cases of latent syphilis, with the result that in no case was a normal pancreas found In all cases of latent syphilis this organ shows marked changes in the form of a diffuse or patchy fibrosis with active inflammatory foci corresponding to the localizations of the spirochetes

Unilateral Renal Hypoplasia and Dysplasia, Relation to So-Called Hypogenetic Nephritis

Dr W M L Coplin, Philadelphia The histologic findings in eleven cases suggest that kidneys of this type have origin in a defective angiogenesis, this occurs in intrauterine life and results in hypoplastic kidneys The patients have high blood pressure, high protein content, and other evidences of defective elimination Renal symptoms appear as soon as any unusual burden is put on the kidneys In this class may be cases of painful kidney, nephritis dolorosa

The Main Factors Affecting the Intensity of the Sounds as They Pass from the Interior of the Lungs to the Periphery of the Chest

Drs George W Norris and C M Montgomery, Philadelphia The main factors diminishing the intensity of sounds as they pass from within the bronchi to the external chest surface are reflection and diffusion Reflection may be a potent factor where vibrations pass between mediums of different densities, as air and fluid or air and tissue. Sound is not much affected in its passage between fluid and tissue because the differences in density are not sufficiently marked Marked vocal resonance occurs over solid lung because the parenchyma is airless, thus eliminating reflection in this part of the lung The vocal resonance may also be increased when fluid separates a solid lung from the chest wall In the normal lung, on the other hand, reflection takes place between the bronchi and the surrounding air, between the tense membranous tissues of the parenchyma and the adjoining air, and between the air in the lung and the chest wall

Diffusion, while more or less a constant factor in all conditions, plays a special part in pleural effusion, the sounds becoming spread out or diluted as they pass from the lung surface in contact with the fluid to the point on the chest revealing diminished vocal resonance.

AMERICAN GYNECOLOGICAL SOCIETY

(*Continued from page 1818*)

Variations in Blood Supply of Ovary

Dr. John A. Sampson, Albany, N Y The material studied consisted of six fetal tubes and ovaries and thirty adult ones in which the arteries had been injected with bismuth, and ten adult tubes and ovaries in which the veins had been injected The uterine artery directly or indirectly supplied a varying portion of the ovary in all, the entire tube in six, the greater portion of the tube in twenty-three, and the round ligament and greater portion of the broad ligament in all but one.

In twenty-four of the thirty specimens the ovarian artery divided into two main branches, a lateral tubo-ovarian or tubal branch and a mesial ovarian, the latter anastomosing with the ovarian branch of the uterine. In six specimens the lateral tubal branch was absent The ovarian artery supplied a varying portion of the ovary in all, the distal portion of the tube in twenty-four and portions of the broad ligament in all, but the latter to a lesser degree than the uterine. In twenty-six of the thirty specimens the uterine supplied the proximal portion of the ovary and the ovarian the distal In four specimens in which the lateral ovarian branch to the tube was absent, the lateral tubal artery arose from the main tubal artery (uterine artery) and supplied the distal portion of the ovary, taking the place of the lateral tubo-ovarian branch from the ovarian artery In these four specimens the distal portion of the ovary was supplied by the uterine, the middle by the ovarian and the proximal by the uterine. As the blood supply of the broad ligament is both uterine and ovarian, as the usual blood supply of the tubes is both uterine and ovarian, as the arteries of the broad ligament communicate with each other and with those of the tube and round ligament, and as the tubal arteries communicate with each other, all these structures must be looked on as containing a potential blood supply to the ovary The actual venous outlet of the ovary is partly through the ovarian veins, partly through the uterine Anatomic studies suggest that if it is necessary to remove a tube without removing the ovary, it should be done with the least possible disturbance of the broad ligament and even then occasionally the blood supply of the distal pole of the ovary will be cut off, also in hysterectomy with conservation of the ovary the accompanying tube should be saved, if possible

Radium Treatment of Three Hundred and Forty-Seven Cases of Cancer of the Uterus and Vagina

Drs Howard A. Kelly and G F Burnam, Baltimore The use of radium in sufficient quantities greatly enhances the chance of permanent recovery of patients with uterine and vaginal cancers In early and good operable cases, the use of radium combined with operation adds greatly to the chance of recovery without a recurrence The most remarkable fact about the radium treatment of uterine and vaginal cancers is that it often clears up those cases which have extended too far locally and become firmly fixed to the pelvic wall, in other words cases which are utterly inoperable We have had 327 cases, including borderline cases, cancer fixed to the pelvic wall, great massive cancers choking the pelvis, and many in which there were general metastases and the radium was used to bring relief alone. Over 20 per cent of this group have apparently been cured In a large number of those who were not cured the discharges stopped, pain ceased, and health was built up

Heat as a Method of Treatment in Inoperable Uterine Carcinoma

Dr James F Percy Galesburg Ill The whole technic can be summed up in the one statement. Do not carbonize the tissues, for in the degree that this is done, in that degree is heat penetration inhibited, and heat penetration is the vitally essential thing

High Heat Versus Low Heat in the Treatment of Cancer of the Uterus

Dr Herman J Boldt, New York Low heat should be reserved principally for a second application, after rapid destruction has been accomplished with high heat, and the charred eschar that was caused by the high heat has been thrown off, and for those cases in which the cancer has so far advanced that the proper application of high heat will endanger the bladder or rectum The danger from secondary hemorrhage is not less with low heat than with high heat No evidence has been presented that shows the superiority of one method over the other Heat properly used and applied in correctly selected cases sometimes gives remarkably good palliative effects, but it has been conclusively shown that cancer cells are not destroyed any appreciable distance from the surface of application, certainly not deeper with low heat than with high heat

End-Results of Treatment of Sterility

Dr John Osborne Polak, Brooklyn One hundred and thirty-two uterine, and three ectopics, are the sum total of pregnancies occurring in 358 women in whom conception was a probability, or 37 per cent In a large number of sterility cases, the women applying for relief have no chance whatever of becoming pregnant, as the pathologic condition is such as to make conception impossible. The male is largely responsible for the poor results in treatment. There is a definite chemicophysiologic factor in conception, at present unexplainable, which is a cause of preventing conception Operative procedures on the uterus, except amputation of the hypertrophied portion, have but a slight influence on the end-results in the treatment of sterility Each case must be individualized, and both contracting parties carefully studied before any treatment is inaugurated

Rupture of the Scar of a Previous Cesarean Section

Dr Palmer Findley, Omaha A perfectly healed cesarean wound may be relied on to resist the forces of labor but in view of the fact that the integrity of the wound is an unknown factor in all cases, we are constrained to exercise the utmost caution in the conduct of every case in pregnancy and labor following cesarean section Failure to secure perfect healing is accounted for by departure from the principles of suture proposed by Sanger and by septic infection of the uterine wound The possible existence of latent gonorrheal infection may defeat the most painstaking efforts to secure perfect wound healing When cesarean section has been followed by a fever course, the uterine wound should be regarded as insecure in event of a subsequent pregnancy and should call for a repeated cesarean section at the onset of labor Sterilization and hysterectomy should replace conservative cesarean section when infection is known to exist The alternative invites faulty wound healing, if not more disastrous results Transverse fundal, extraperitoneal and cervical incisions have not lessened the liability of rupture in subsequent labors but, on the contrary have probably increased the hazard The possibility of rupture of the scar following cesarean section does not justify sterilization, but rather calls for the exercise of masterly control in the event of a subsequent pregnancy Version high forceps uterine tampons hydrostatic bags and pituitary extract should never be employed in the presence of a cesarean section The liability of rupture is a real danger and should stand as an argument against the increasing tendency to widen the scope of elective cesarean operations

Painless Labor

Dr. J Clifton Edgar, New York Never before has the need for an artificial painless labor been more urgent. Shock from pain in labor in the highly civilized neurotic woman must be reckoned with in the general childbed mortality Painless labor in these women is a life-saving measure The only absolutely painless labor is the one terminated by sur-

and general upbuilding I have one man who has been very well for several years, his hemoglobin has gone to 108 and he is very robust now His hemoglobin was down below 30 per cent at one time I cannot believe he will continue well I think he will ultimately die of the disease

Facial Diplegia in Multiple Neuritis

Dr Hugh T Patrick, Chicago The combination of complete double facial palsy with less intense involvement of the extremities is the striking feature In only one instance is the facial palsy partial But the degree of quadriplegia is exceedingly variable Assuming that multiple neuritis is always caused by a poison, and knowing that certain tissues are peculiarly vulnerable to certain poisons, perhaps we are equally reasonable in saying that certain poisons have a special predilection for certain tissues This cannot confidently be answered in the affirmative But the negative aspect is interesting Apparently the most frequent causes of multiple neuritis do not cause facial diplegia No case has been due to a metallic poison (except probably one of plumbism) and I believe no case is due to alcohol, although one patient was a wine dealer I have found no typical case due to diphtheria There is no case following typhoid unless my first case is one The most frequently surmised cause has been influenza, but in no case was this definitely ascertained, and in only four out of thirty-four cases was it thought highly probable

DISCUSSION

Dr Sidney I Schwab, St Louis I have had two patients, one died In both the bladder and rectal reflexes were lost I have an idea that the method by which the spinal cord is finally attacked is through the sheath of some of the peripheral nerves attacked I believe it is impossible anatomically to produce bladder and rectal insufficiency purely through the peripheral mechanism We must conclude that in these cases there is some definite process which gets to the cord along the nerves which happen to be attacked Another feature is the curious emotional state of these patients The neuritis itself may be somewhat insignificant, but in the midst of this neuritic complication the sudden or even gradual paralysis causes in these patients a most profound emotional disturbance The last patient I had became very emotional and very depressed, slightly maniacal, and with the disappearance of the facial diplegia these symptoms disappeared

Dr William G Spiller, Philadelphia I can add another case of facial diplegia which occurred in neuritis A year or two ago I had a man in my service with marked neuritis of the Landry type There had been ascending paralysis He had marked diplegia facialis It was purely alcoholic He had been admitted to the "drunk" wards many times In regard to Dr Patrick's statement regarding the possible toxic factor, during the past winter there has been an interesting case in the Philadelphia Hospital, that of a boy recovering from tetanus A facial palsy developed during the fourth or fifth week from a draft I thought that the tetanus intoxication predisposed the lad to the effect of the draft

Dr Archibald Church, Chicago Last November I saw a young man who presented the condition Dr Patrick outlined, rather mild multiple neuritis with diplegia There was a most painstaking search of the secretions of the body, spinal fluid, blood and everything else which was open to laboratory investigation, but these were entirely negative He was excessively fond of candy, and ate from 1 to 2 pounds a day After the onset of symptoms, which were largely sensory at first, a severe diarrhea developed He recovered rapidly and was discharged in ten weeks able to walk and feeling quite comfortable Another case, which I saw many years ago, occurred with acute intestinal disturbance

Dr Charles L Dana, New York I watched cases of neuritis in alcohol wards for twenty-five or thirty years, and there never occurred a case of facial diplegia I used to look out for that phenomenon because many years ago I had a case which falls definitely into the group Dr Patrick described A young man, very active and a moderate drinker, went to North Carolina, and while there was exposed to a good deal of cold and wet, and possibly ate canned food He developed a slight degree of multiple neuritis and very complete facial diplegia He gradually but slowly recovered from his neuritis and almost completely from the diplegia Though he was somewhat depressed, he apparently got well About ten years afterward he developed melancholia and shot himself I think the suggestion Dr Patrick made that these things are toxic in character is in harmony with what we have been believing in regard to the pathology of paralysis I have for a long time considered it an infectious neuritis, and I do not see that the fact that a neuritis is unilateral may exclude infection

Dr Smith Ely Jelliffe, New York What lies behind the individual susceptibility in these cases? It certainly is recognized that the toxic factor may be one of the links in the chain, but what about the nervous system itself? What about the variations in the nervous system? One must interpret the hysterical monoplegia of toxic origin, the diplegia cases of bacterial origin In such cases one must go to the hysterical side of the mechanism

Dr Samuel Leopold, Philadelphia I wish to place on record a similar case in which the etiology was clear It showed the typical facial diplegic and multiple neuritic phenomena in which the origin was given as quinsy

Obstetric Paralysis

Drs John Jenks Thomas and James Warren Sever, Boston There is no evidence from our experimental work, or clinical observation, to support the theories of Lange and T Turner Thomas that the primary cause of obstetric paralysis lies in an injury of the capsule of the shoulder joint, or a dislocation, with secondary damage to the nerve trunks This theory gets no support from experimental work, and in addition does not account for the distribution of the paresis of muscles generally seen, such as the spinati, supplied by the suprascapular nerves, or the frequent involvement of the sympathetic fibers going to the pupil and eyelid, often seen in cases of paralysis of the whole arm, and of the lower arm group The partial dislocation of the head of the humerus backward, the bending down of the tip of the acromion and the forward dislocation of the upper end of the radius are all secondary changes, due to the formation of contractures in the stronger or unaffected muscles Dislocations of the shoulder, separation of the epiphyseal end of the humerus, or fractures of its shaft, like fractures of the clavicle, are infrequent accidents, and while they may be unaccompanied by an injury of the plexus, more frequently they are complicating injuries, which rarely cause permanent difficulties The treatment, to be effective, must be adapted to the conditions in the individual case Treatment by massage of the paralyzed muscles and development of them as they recover through educational exercises are necessary in all cases in which the plexus has been injured to more than a very slight extent Resection of the plexus and transplantation of torn nerve roots of the plexus are to be reserved for cases which do not show evidence of recovery of function in definite groups of muscles within a reasonable time, generally not less than six months, though frequently this time needs to be extended to a year, a year and a half, or occasionally even longer The late complicating deformities about the shoulder and elbow joints should be treated on orthopedic principles We resort to division of the tendon of the subscapular muscles outside the joint These cases need careful aftertreatment by passive movement massage, and educational exercises to bring about free and natural movement in the joints and use of the extremity

DISCUSSION

Dr Charles K Mills, Philadelphia I believe that these obstetric palsies are due, in a large percentage of the cases, not to the direct lesion of the brachial plexus or of the shoulder, but to an avulsion of the nerve roots of the plexus Traction on the plexus occurs, with avulsion of the nerve roots or a certain part of the nerve roots of the plexus and, therefore, a total and permanent destruction which can never be very fully or largely repaired except by adaptation or compensatory operation

Dr. E. W Taylor Boston I was called to deliver a woman with a badly deformed pelvis It was necessary to do version in which the extraction was breech extraction Feeling that this type of lesion was exceedingly apt to occur, I put most of the traction on the lower extremities of the child until they were so damaged I did not dare continue, then the pressure was exerted over the shoulder, and a lesion of the brachial plexus occurred After delivery we found symptoms of double hemorrhage from both hemispheres

Dr John Jenks Thomas, Boston The lesion in these cases is not a constant one It varies in severity and in the situation of the injury Occasionally avulsion of nerve roots is seen Some of our cases have shown separation between the nerves of the plexus I do not agree in the advisability of early exploratory operations in all cases That should never be done in cases in which, at the time, soon after birth, we find the injury limited to the upper arm group of muscles These cases practically all show partial recovery after operation The question is somewhat different when we come to total arm paralysis I think our work has given us a clue as to why this is so In the upper arm paralysis, although the nerves are stretched, you have fraying out of the fibers and hemorrhage within the sheath, though there is no complete separation or tear of the plexus The only complete injury we find, then is the tearing off of the suprascapular nerve To suture the suprascapular nerve which is very small in the infant I think is practically impossible My plea is that we should make our treatments suit the individual case.

MEDICAL SOCIETY OF THE STATE OF NEW YORK

One Hundred and Tenth Annual Meeting held at Saratoga Springs May 16 18 1916

(Continued from page 1817)

Metabolism in Gout

Dr. Nellis B Foster, New York In gout, as in health the sources of uric acid do not differ, there is no new source of supply It seems likely then, that the uric acid increase in the blood in gout is due to defect in excretion The same increase in the blood is noted in renal disease For the deposition of uric acid as tophi, no explanation is at hand It is not due to the blood being saturated, serum dissolves more uric acid than water because of the phosphate content The explanation is probably to be found in the chemical state of uric acid which exists in two forms in many animals, free and combined This is not demonstrated in man as yet, but evidence pointing to this conclusion is accumulating

Treatment of Gout

Dr. Arthur F Chace, New York Treatment is directed toward lessening the formation of uric acid and to facilitating its elimination The elimination of uric acid is not increased by giving quinin colchicum or diuretics Alcohol, tea and coffee cause a retention of uric acid in the blood A purin-free diet is given containing all foods except meat, meat extracts, peas, beans spinach, tea, coffee and alcohol and an accessory diet consisting of meats and fish, of which the uric acid forming possibilities are known. By determining the eliminative capacity of the body for exogenous uric acid it is possible to keep the intake of purins well within the limit Or the number of days required to eliminate the uric acid arising from a definite amount of purin substance can be ascertained and articles on the accessory diet list given at such intervals that retention of uric acid is avoided The continuous use of alkaline drinking waters induces a deposition of sodium biurate in the joints and cartilages and is capable of precipitating an acute attack of gout. The value of the periodic administration of atophan or, in nonnephritic cases, of salicylates in depleting the blood temporarily of uric acid is a means of giving symptomatic relief and preventing the deposition of uric acid in the joints, thereby aborting acute gouty attacks Exercise massage and hydrotherapy assist in the elimination of uric acid while the treatment of acute attacks is limited to the giving of colchicum, large doses of hydrochloric acid, salicylates, water and the application of soothing lotions

Torsion of the Pedicle of Ovarian Cysts Complicating Acute Appendicitis

Dr Ross D Loop, Elmira I have found eight cases in the literature, and can add four personal cases In all these cases the appendix was primarily involved The diagnosis of cysts should be made before acute symptoms supervene The causes of torsion are many The tendency for organisms to grow spirally, the length of the pedicle, the freedom from adhesions, the heavy lobular space of the cysts, all are predisposing causes Emptying or filling of the bladder or rectum, violent peristalsis, increased pressure, coughing, vomiting, lifting falls or jolts, all cause rotation in a cyst which is often insecurely balanced Muscle spasm, vomiting and distention, so often accompanying appendicitis, are frequent features that will favor torsion The results of sudden strangulation are gangrene, infection and peritonitis, without any increase in the size of the cyst

DISCUSSION

Dr W M Brown, Rochester I have observed one case in which the only diagnosis made was appendicitis There seemed to be a very marked right-sided pathologic condition The patient was extremely ill I opened the abdomen and found the appendix to be absolutely normal There was a cyst of 6 ounces' content which evidently had ruptured shortly before the operation, because the viscid fluid was lying in the pelvis The cyst was as large as a croquet ball, and gangrenous The patient made a good recovery

Dr George Gray Ward, New York I have known a game of golf to accomplish rupture of a cyst There was violent pain, and at operation a strangulated cyst was found

Dr Milo L Seccomb, Auburn I had a case of a child of 9 years with an attack of apparent influenza It was thought that the bladder was distended At operation a cyst was found with a twisted pedicle

11 Mercuric Chlorid Intravenously in Malaria—A solution of mercuric chlorid in physiologic salt solution was used by Barlow of such strength that 10 c.c. of solution represented

⅛ gram of mercuric chlorid The iodin used to disinfect the arm was washed off with alcohol, to avoid any possible formation of mercuric iodid An analysis of all sixty-nine cases recorded indicates that when there were but a small number of parasites in the blood, mercury usually brought about a complete sterilization at the first injection This result was obtained in some cases when there were as many as three parasites in each field With much higher infections the fever was reduced, sometimes disappeared after a few days to return later, and sometimes after a reduction, again rose but not to the point which it had reached previous to the injection Ill effects from mercury were seen in very few cases, and in these were very slight Diarrhea was observed in eleven cases, but rarely persisted more than one day, was not violent, or severe in character, and indeed, could rather be welcomed than looked on with disapproval Salivation occurred in but one case which was treated with three injections within five days In this case, it was very slight and disappeared three days later It seems that the constitutional effects of mercury, given intravenously, appear very quickly if they are to appear at all, and that their disappearance is equally prompt There seems to be but little danger, therefore, of the cumulative effects if an interval of four days or over is left between the doses, if such effects do appear, they will be very slight and will be promptly noticed Nephritis was not produced in a single case Phlebitis, at the point of injection, was observed in only three or four cases, and should not occur if a small sharp needle is used with careful technic

No routine treatment should be followed, says Barlow, but every case should be treated actively until all symptoms of malaria have disappeared until the blood is practically normal, excepting for a moderate anemia and leukopenia consequent from the administration of quinin, and above all, until the spleen has returned to normal size and is not tender During the fever all adjuncts to treatment, such as rest in bed, laxatives, restricted diet, and in severe cases, intravenous or multiple intramuscular injections should be used Quinin should be given daily according to the method found most efficacious by the experimenter, and an injection of mercury of one-fourth gram for each 150-pound weight of patient *should be given at such intervals as may seem best*, Barlow advises weekly intervals If the reduction of the size of the enlarged spleen be not very rapid and accomplished at the rate of at least 1 inch a week, he advises that search should be made for uncinaria, and if present this should be treated as soon as the fever has disappeared

24 Loss of Sight From Retrobulbar Neuritis Due to Accessory Sinus Disease, Report of Two Cases L E White, Boston

20 Disinfection of Septic Joints—Cotton emphasizes the fact that the joint itself—the closed joint—has a high resistance to septic infections, that the joint cavity is far more capable of disinfection than the surrounding muscular and intermuscular spaces, but only when it is kept apart—as a closed joint Cotton cites cases in which the joint was irrigated for *fifteen minutes* with 1 15,000 of bichlorid in salt solution, then flushed with simple salt solution, the capsule was then accurately stitched together This *treatment* is held to be harmless and efficacious Cotton is not sure that corrosive is the last answer, but he is convinced that we should disinfect and then seal the joint to protect it

22 B Dysenteriae as Cause of Infectious Diarrhea in Infants—In seventy-five cases of infectious diarrhea studied by Ten Broeck and Norbury the dysentery bacillus was recovered from the stool in fifty-one instances, or 68 per cent In five other cases they were unable to isolate it from the stool, but found it in cultures made at necropsy, thus making a total of fifty-six instances, or 74 and 6 10 per cent of the total number of cases in which the dysentery bacillus was found

23 Intraspinal Injections of Bichlorid of Mercury—Additional cases are cited by Hunt to show that the administra*tion of bichlorid of mercury directly into the* spinal *fluid* gives practically the same results as the administration of mercurialized serum It has the advantage over the latter of simpler technic, shorter methods, and easier administration, with less opportunity of infection Both methods, that *of the mercurialized serum and that* of the bichlorid directly *injected into the spinal fluid*, can be considered as valuable substitutes for the administration of salvarsan Certainly no ill results can accrue from the direct intraspinous injection *of one fiftieth of a gram of bichlorid* of mercury in syphilis *of the nervous system* It is well to make the initial dose small, it is therefore better to begin with a dosage of one *sixty-fourth of a gram* and later increase it to one fiftieth

33 Immunologic Studies on Hodgkin's Disease—Moore reports experiments made to ascertain whether an immune serum could be produced which would have either palliative or curative action in this disease In April, 1914, immunization of a horse was commenced with sixteen strains of diphtheroid organisms obtained from cases of Hodgkin's disease Killed bacilli were injected intravenously The horses were immunized by repeated intravenous injections In complement fixation *tests this immune* serum bound complement when used with these same organisms as antigens in amounts as small as 0 0005 c c Complete hemolysis occurred with control antigens of staphylococci, streptococci, diphtheria bacilli, gonococci, and lipoidal extracts and 0 1 c c of the immune serum Complete hemolysis resulted when control horse serums were added to the diphtheroid antigen in amounts of 0 1 c c

Agglutinin was found to be increased fourfold by the immunization The refined serum produced fewer allergic reactions than the whole serum Monkeys were immunized with the same organisms by both subcutaneous and intravenous inoculations An increase in complement binding amboceptors was found in the serum after the injections By similar methods immune serums were obtained from rabbits Soluble toxins were not formed by these organisms when grown in glucose broth Complement fixation tests were made on ten individuals having Hodgkin s disease and in no case was there inhibition of hemolysis with antigens of the mixed cultures isolated from Hodgkin's disease In two cases antigens prepared from organisms cultured from the patient's glands were used with negative results Vaccination with these organisms did not appear to increase the complement binding antibodies in patients Complement fixation tests on the serums of these patients with control antigens were negative in all except one instance in which positive Wassermanns were repeatedly obtained Agglutination experiments with the serums of two patients were likewise negative Complement fixation tests made on serum from cases of lymphosarcoma lymphatic leukemia, chronic arthritis, and tuberculosis, diseases in which diphtheroid organisms have been isolated, all reacted negatively with the various antigens used

35 **Medium for Isolation of Typhoid Bacilli from Stools**—The medium devised by Holt-Harris and Teague consists of a combination of methylene blue and eosin in nutrient agar containing lactose and saccharose On plates of this medium after eighten hours' incubation the colonies of typhoid are colorless and transparent while those of B coli are a deep black and do not transmit light The medium immediately around the colonies of B coli remains practically unchanged Hence the plate is workable even when the colonies are close together More of the feces therefore, can be safely inoculated on this medium than on the Endo plate and it is to that extent more delicate and to be preferred

36 **New Differential Medium for Cholera Vibrio**—On sugar free nutrient agar to which Teague and Travis added 1 per cent saccharose 0.25 per cent nutrose and 0 0625 per cent bluish eosin the cholera colonies have red centers, while the colonies of B coli are uniformly pink

39 **Coexistence of Antibody and Antigen**—Antigen both in the cells and in the blood and antibody, likewise, in the cells and in the blood were demonstrated by Denzer during a period of three weeks succeeding the injection of a foreign serum into a guinea-pig Antigen in the cells was demonstrated for a period of seventeen days after injection, antigen in the blood also for seventeen days After this time these factors apparently disappear Antibody was demonstrable in the cells from the ninth day onward, and was in the blood after the fourteenth day

40 **Brilliant Green Medium for Typhoid Bacilli.**—The eosin brilliant green agar containing lactose and saccharose is the medium which Teague and Clurman recommend for the isolation of typhoid bacilli from stools After eighteen hours' incubation the typhoid colonies by reflected light are grayish in color while the colonies of B coli have red centers By transmitted light the typhoid colonies are transparent and colorless while colonies of B coli show dark centers On further incubation the typhoid colony becomes pink and the whole colony of B coli becomes dark red or dark purple in color, the typhoid colony remains translucent, while the colony of B coli becomes more and more opaque The typhoid colony may show the center somewhat darker than the periphery but the whole colony is much paler than that of B coli and is readily distinguished from it If the colonies are packed closely together on the plate, this differentiation is obscured the typhoid colonies assuming a darker color and those of B coli failing to develop centers properly, however, on account of the inhibition which the medium exerts on the growth of most strains of B coli, this is not likely to occur

41 **Isolation of Typhoid Bacilli from Stools**—Teague and Clurman advise that the feces be added to 30 per cent glycerin not more than 1 part of feces to 2 parts of glycerin, in a bottle with a screw top such as is used for sputum The bottle should be shaken well, to distribute the stool material throughout the glycerin The 30 per cent glycerin is prepared by adding glycerin to sterile 0 6 per cent. sodium chlorid solution

42 **Experimental Cloudy Swelling of Kidney**—The term 'cloudy swelling" is used by Shannon to designate a turbid swollen organ without regard to the microscopic picture that may be present To secure uniform results rabbits were used exclusively in this study The normal rabbit kidney always contains in the convoluted tubules, coarse albuminous granules Usually these granules are so numerous in a few tubules that these appear dark in the fresh tissue The granules are apparently thin-walled vesicles filled with fluid They are best fixed by solutions containing formaldehyd They are not fixed in solutions containing acetic acid On the addition of 5 per cent sodium hydroxid or potassium hydroxid these granules disappear suddenly When one kidney is removed the dark tubules are increased in the opposite kidney during the first twenty-four or forty-eight hours, but the increase of albuminous granules is not sufficient to cause and definite change in the gross appearance of the kidney Subcutaneous injections of tartrates produce a swollen, cloudy kidney, but there is no increase of albuminous granules The cloudiness and swelling are apparently due to edema, anemia, tissue disintegration, etc Intraperitoneal injections of autolyzed liver tissue produce a markedly cloudy and swollen kidney The albuminous granules disappear entirely The gross changes are apparently due to the same factors concerned in the tartrate experiments

Chronic suppurative processes attended with marked emaciation cause an enormous increase of albuminous granules in the kidneys These granules are often larger than the normal and irregular in shape, but they seem to have the same chemical composition Acute toxemias cause a rapid disappearance of the normal albuminous granules An acute toxemia superimposed on a chronic suppurative process causes a disappearance of the albuminous granules Kidneys which show an enormous increase of albuminous granules usually give a normal phthalein output and the cells are usually intact This form of cloudy swelling is therefore probably not a degenerative change but a physiologic response to an increase of protein waste products in the blood There is no relation between the formation of albuminous granules and fatty metamorphosis It is suggested by Shannon that the term cloudy swelling be discarded and that the several processes producing this appearance be considered separately

44 **Specific Parenteral Digestion, Its Relation to Phenomena of Immunity and Anaphylaxis**—In repeating the work of Abderhalden and his collaborators Bronfenbrenner found that, although under certain conditions of experiment, the antigen may be actually digested by the ferments of the blood of prepared animals, the ferments responsible for such digestion are not specific. In fact, as others have shown before the digestive ferments are present in every fresh serum and it set free can digest any suitably prepared substratum in vitro, without any specific predilection Bronfen-

brenner found that although the ferments concerned in the digestion are not specific (inasmuch as they can be made to digest any substratum), the phenomenon, as a whole is not devoid of a certain degree of specificity and therefore could not be reduced to mechanical absorption of antiferments

A systematic study of this question brought him to the conclusion that the element of specificity lies, not in the ferment itself, but in the mechanism of its activation Namely, he found that the apparent specificity of ferment action in vivo assumed by Vaughan, and demonstrated in vitro by the methods of Abderhalden, is due to the fact that the combination of specific serum with its corresponding antigen in vivo as well as in vitro, is followed by a radical change in the degree of dispersion of serum colloids This physicochemical change in turn is followed by the activation of a normal nonspecific ferment of the serum If such a conception is correct, Bronfenbrenner says, the phenomenon of specific *parenteral digestion* may be explained on a basis very similar to that offered by the chemical theory of Vaughan, but instead of specific ferments, the digestion will be ascribed to normal nonspecific ferments present in any fresh serum (complement?) and set free by a specific mechanism of combination between the antigen and antibody, very similar to that recorded by the meiostagmin reaction of Ascoli

47 **Laboratory Methods in Pulmonary Tuberculosis**—In fifty-nine cases of tuberculosis examined by Kahn, the serum test was positive in about 92 per cent of the cases, while the Weiss test was positive in about 13 per cent of the cases, and the diazo test in about 8 per cent In first stage cases, the serum test was positive in 84 per cent, while the Weiss test was positive in 4 per cent, in second stage cases the serum test was positive in 94 per cent and the Weiss test was positive in 9 per cent, whereas in third stage cases, the serum test was positive in only 15 per cent whereas the positive urochromogen test rose to 31 per cent

76 **Roentgen Diagnosis of Gas and Pus Infections**—In all cases in which the Roentgen ray has shown a "halo-like" shadow about the missile, Davis found clinically, at the operating table and in the laboratory, evidence of an infection caused by gas forming and pus forming organisms

78 **Origin of Hypernephroma of Kidney**—Of thirty-four so-called hypernephromas of the kidney studied by Fraser there is convincing evidence, from both the clinical and morphologic viewpoint, that one of the number was a neoplasm originating in an accessory nest of cortical suprarenal cells, although the possibility of origin from the cortical cells of a misplaced suprarenal composite cannot be denied The patient in whom this tumor was found, was a female with pronounced male characteristics In still another case of so-called hypernephroma of the kidney, the morphologic evidence tends strongly to support the view that the tumor arose from multiple nests of suprarenal cortical cells lying in or around the capsule of the kidney In the remaining thirty-two instances, however, the morphologic evidence indicates that the tumors were derived from renal adenomas In other words, it would appear from this that the majority of cases of hypernephromas is misnamed and should be classified as nephromas, the term hypernephroma being reserved for malignant tumors arising from cortical suprarenal cells

82 Abstracted in The Journal, January 22, p 303

84 **Hereditary Syphilis, Spurs on Os Calcis**—This paper is based on a study of nine cases, in three of which the symptoms recurred after temporary improvement, following the removal of the spurs In the other six, no operations were performed The diagnosis was confirmed in seven cases by Roentgen ray As the result of the study of these cases of spur formation, Swett and Stoll believe that hereditary syphilis is responsible for many of these exostoses The study of the family history suggests syphilis more frequently, perhaps, than does the examination of the patient himself who rarely presents any obtrusive signs of hereditary syphilis, though a very careful examination will often reveal something that is suggestive The Wassermann test was negative in all the cases

89 Abstracted in The Journal, January 15, p 218

96 **New Operation for Treatment of Varicocele**—This operation done by Del Valle diminishes the congestion of the veins by alternate ligatures and suspends the testicle at a convenient height, thus correcting the ptosis He first exposes the external abdominal ring, then the spermatic cord The he dissects the veins, from the external abdominal ring to the

testicle, from the other parts of the cord The operator carefully separates the veins into two groups an anterior and a posterior A catgut ligature is now passed and tied around the posterior group one finger's breadth above the upper limit of the testicle Another ligature (silk) is similarly applied to the anterior group but two fingers' breadth above the level of the catgut suture and left long The anterior group of veins is passed through an opening in the fascia of the internal or external pillar so as to raise the testicle The operation is finished by suturing the edges of the incision in the fascia together behind the loop of the veins thus leaving each end of the incision open for the veins to pass through

6 *Easy and Rapid Method of Doing Widal's Reaction for Typhoid A. C Coles
7 Treatment of Wound Infections. W P Morgan.

1 **Gerontal Constipation and Its Treatment.**—Among the causes of constipation in the aged Hollis mentions prostatic enlargement, ineffective peristalsis and dryness of the intestinal mucosa which leads to excessive straining at stool and may also account for the comparative frequency with which volvulus of sigmoid affects old men, the twisting of the gut being an immediate consequence of an overstrain The treatment of gerontal constipation is medicinal, dietetic and manipulatory So far as drugs in general are concerned Hollis says their action can at best be only palliative Within these limitations and as a preventive of a colic cascara is very useful It ought to be given in a full dose directly and falling off in quantity or quality of the daily evacuation is observable The ordinary rules regarding the modified requirements of the aged man for meats and the satisfactory mastication of food should be in all cases carefully observed Dental hygiene is also very important. The less stimulant the old man absorbs the better his ultimate chance of longevity Cleanliness is undoubtedly the most important manipulative procedure Congested piles rents in anal mucosa commencing prolapse all rapidly yield as a rule to a regime of cleanliness But in order that the hygienic procedure may produce the maximum effect, it must be started early When there is much straining at stool the gerontal right index-finger, well guarded it may be, with two or three thicknesses of tissue paper, should be pressed on the perineum just behind the symphysis and so relieve the abnormal pressure of an enlarged prostate on the rectum

5 **Examination of Dysentery Carriers**—Among fifty dysentery convalescents examined by the authors three to six months after the onset of their illness, nine were still excreting *L histolytica,* two were still excreting *B dysenteriae* (Shiga) These eleven men were therefore potential sources for the outbreak of fresh epidemics

6 **Easy Method of Doing Widal's Reaction for Typhoid**—The method devised by Coles is as follows With a color grease glass writing pencil, or a piece of wax, draw a line across the middle of two slides at right angles to their long axes Spread a film of the blood to be examined on one half of each slide, and, when dry, spread a film of normal blood as a control, on the other half of each slide. Dry Place a small drop of an emulsion of killed typhoid bacilli on the center of each half of both slides, and rub the drop well over the film of blood taking care not to pass from one half of the film to the other without sterilizing the needle On one slide carefully place a cover glass on each half, taking care that the two cover glasses are well separated in the middle by the mark of the grease pencil Place the other slide on a piece of wet blotting paper, and cover with a Petri dish to prevent evaporation for a period of fifteen to twenty minutes At the end of that time dry carefully over the flame, and then stain Examine both halves of the first slide under a moderately low power At the end of fifteen minutes (often much sooner) distinct clumps of agglutinated bacilli will be seen, provided the case be one of typhoid or the blood of one who has been prophylactively inoculated with a typhoid vaccine, while on the other half, the control, the bacilli show no signs of clumping The red cells are practically invisible, but the leukocytes are clearly defined and it is quite easy, provided the film has been thin, to determine the presence or absence of leukocytosis and to make, if necessary, a differential count of the various forms of white cells present

9 **Malignant Disease of Nose or Accessory Sinuses**—The advantages of Moure's operation or lateral rhinotomy of the nose or accessory sinuses (through the face) are emphasized by Thomson and two cases are cited In the first an endothelioma of the ethmoid and antrum There has been no recurrence after five and a half years The second case was one of epithelioma of left maxillary antrum Moure's operation was done and there has been no recurrence after three and a half years

11 **Lead in Urine in Trench Nephritis**—White examined five specimens from trench nephritis (two of them from the same case at different times), two specimens from ordinary nephritis each of them the mixed urines from two cases and a normal urine to serve as a blank experiment Lead was present in all the specimens from trench nephritis and in one of the mixed urines of ordinary nephritis Iron was present in all the nephritic specimens and copper in most of them Tin was also present in one specimen This was the most recent case and contained more lead than the others A specimen from the same case a month later contained less lead, and tin was not found White has come to the conclusion that copper is universally present in the tissues and he has found it in normal urine to the extent of 0.2 mg per liter The iron he says can be attributed to the blood which was present in all cases and possibly to the medicinal administration of iron. The presence of lead and tin in urine, however he regards as abnormal The constant presence of lead in these cases and the presence of tin in one of them suggests the possibility of the metals being derived from canned foods

16 Gangrenous Process Over Arm and Back Following Vaccination of Adult Against Smallpox (Cas de vaste gangrene phagedenique probablement causee par le ' Bacillus pyocyaneus," a la suite de la vaccine) Balzer and E Moulard

14 **Early Closure of War Wounds**—Dehelly is surgeon at the hospital in charge of Carrel at Compiegne He relates the ultimate outcome of Carrel's method of treating war wounds in 48 out of 76 cases The 48 men had a total of 155 wounds, including a number with fractured bones One hundred thirty-five of the wounds were closed before granulation had begun (See abstract 36, The Journal, May 13, 1916, p 1586) Of the 121 wounds closed before the twelfth day, healing was complete in less than thirty days in 119 This list includes 18 of the 22 with fracture Of the total 155 wounds, it was thus found possible to close up early all but 12 6 per cent and of the 135 thus closed, 88 25 per cent were entirely healed by the end of the month He adds that this shortening by two thirds the average healing period is far from being the only advantage of the Carrel method The sterilization is so thorough that the lymph glands and bone surfaces heal without inflammation and hence there is no tendency to muscular contraction or stiffness from cicatricial tissue The coaptation of the normal tissues causes them to grow together, retaining their suppleness, without an intervening stiff wall of scar tissue as when wounds are left to grow up spontaneously

15 **Surgical Treatment of Traumatic Detachment of the Retina**—Bonnefon emphasizes the way in which the war experiences are confirming the relative harmlessness of detachment of the retina following a trauma in comparison to that of endogenous origin The condition is indispensable, however *that treatment be applied at once The retina loses* its vitality so rapidly after detachment that it must be restored to place on the spot By the time the man reaches the base hospital the retina is injured beyond repair He has cured completely three cases of extensive detachment of the retina with reduction of vision to perception of light He obtains access by severing one of the rectus muscles as for an advancement operation The region of the equator thus exposed is punctured deep at one or two points with the fine tip of the actual cautery at red heat Two stitches are taken including muscle, aponeurosis and conjunctiva, to repair the breach, then absolute rest in bed, immobilization and atropin The suture threads are removed the fifth day, and a few subconjunctival injections of saline after the eighth day may aid In one of his cases vision had been reduced to perception of light *but by the sixth day there was no visible trace* of the detachment and visual acuity was 8/10 and became finally 8/10 and has persisted unimpaired during the three months since to date This ignipuncture revulsion he has also found useful in treatment of contusion of the eyeball with intra-ocular effusion It promotes absorption of an effusion either on the retina or in the vitreous body In conclusion he reiterates the importance of promptness, saying that treatment of detachment of the retina is the only intervention on the eyes which should be undertaken at the front

21 **Continuous Irrigation Method of Treating Wounds**—This article is practically a continuation of the one reviewed above, abstract 14 The exact technic for the continuous irrigation is here described Figure 1 shows the glass receptacle holding up to 1 liter of Dakin's hypochlorite solution, and the rubber tube, 2 meters long, with an interposed glass drop-counter about 20 cm below the receptacle Figure 2 shows the rubber tube about 25 cm long and Figure 3 a section of the same These short tubes are used of various diameters The lower end is tied and above that the tube is perforated, and is fitted with the sponge tissue which is sewed solidly to the wall of the tube and closed below to form a bag Other tubes are used to drain away the fluid They are about 25 or 35 cm long and have no side perforations The dressings used are made of carded cotton with a thin layer of absorbent cotton and the whole is wrapped in gauze The dressing when finished is about 3 cm thick and is passed once entirely around the limb The aim is to have the sterilizing solution in constant contact with every part of the wound all the time For a superficial wound all that is necessary is to cover the wound with a single layer of gauze and lay along over the wound, above this, one of the rubber tubes perforated with minute holes the length of the wound This keeps the entire wound well moistened, the single layer of gauze not permitting secretions to accumulate under it while it prevents the holes in the tube from becoming obstructed A deep cavity with small opening is treated with tubes perforated only close to the tip Enough are used to carry one into every compartment of the wound, as shown in a cut The fluid entering below pours out of the opening above It may be *necessary to introduce a gauze wick* with the tube, to hold the tissues apart enough for this to occur, or the tube may be wrapped with gauze to hold back the fluid if the wound is emptied by gravity too rapidly

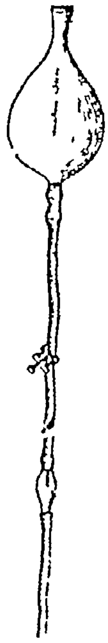

Figure 1

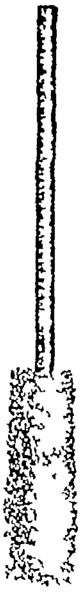

Figure 2

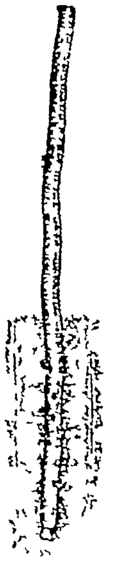

Figure 3

The receptacle stands on a shelf fastened to the foot or head of the bed, and there must be as many receptacles as there are tubes used for the irrigation The connecting tube is attached to the tube in the wound as soon as the wounded patient is placed in bed Attempts to divert the fluid from a single irrigator into more than one tube always proved a failure If the tube in the wound becomes blocked with a clot, it should be syringed free For a small cavity, 5 drops a minute have proved ample For a large wound, 20 drops is the rule The attendant must *ascertain that the wound* is thoroughly irrigated throughout but that the bed is not wet The cotton dressing is changed twice a day The skin around is protected with petrolatum The continuous sterilization is kept up for three or four days Bacteriologic examination of swabs will confirm the progressive diminution in the number of germs suspected from the clinical aspect

When the microbes have disappeared from the secretions, the instillation tubes are removed and a gently compressing dressing is applied The next day, if there has been no oozing from the depths, the cavity below may be regarded as closed, only the skin still gapes and the lips of the wound are brought together This can usually be done by the fifth day It is better to draw them together with strips of plaster than to suture as this permits coaptating all parts of the wound and by applying the compression all around the limb helps to close all the cavities below Strips about 20 or 25 cm long by 3 or 4 cm wide are used Half of the strip is stuck to the limb on one side of the wound and then, as the lips are brought together, the rest is wound around the other half of the limb For very large wounds, two strips of plaster 7 or 8 cm wide are used, fitted with a row of hooks such as are seen on men's shoes The wound is then laced up like a shoe The lacing is done with heavy rubber bands like those used in boys' slings The traction from the rubber soon draws the lips together The plaster strips are kept in place, like sutures for five or six days If it becomes necessary on account of oozing to undo them at any point, great care is taken not to disturb the healing processes

27 *Ultimate Outcome of Thyroid Autograft E. Kummer

23 **"Preventive Sun Cure"**—Every day one or more groups of from twenty to thirty children gather at a certain spot in their quarter where a guide and assistant meet them and conduct the party to the banks of a lake not far from town Here they spend the afternoon in games and gymnastic exercises clothed only in bathing trunks The aim is to apply Rollier s system of heliotherapy as perfectly in the limited time afforded as is possible, and the work is all modeled on that in his institution It was organized a year ago by Dr L Jeanneret for the more delicate schoolchildren of the city of Basel and it has proved successful beyond all anticipations He advertised for helpers in the papers, asking young men or young women to give up one afternoon in each two weeks to a group of frail children to help make them robust. Reflection from the lake doubles or triples the effect of the sunlight There were only five days during the entire summer in which the trips could not be made on account of the weather A group of children too small to take the half-hour walk were provided with a sanded and fenced space for the purpose in one of the public parks in town A regular system was followed each day, the walk to the lake then rest or quiet games then gymnastics and games of all kinds Efforts are made to train the children in good habits of breathing The chest diameter of the 200 children increased by 2 03 cm on an average between July 14 and September 4, and the average increase in weight was 825 gm Only four children failed to show this increase The entire expense from May to October was about $21 When cold weather came the children had their walk and the games Saturdays, but they did not remove their clothing Jeanneret urges that gymnastic exercises in schools should be taken with the trunk bare and in the open air when possible

24 **Dosage of Amino Acids and Polypeptids in the Blood**—Amann has worked out a technic which requires only 1 c c of blood serum for the colorimetric quantitative test for amino acids as a supplement to the Abderhalden ninhydrin test The test takes only a few minutes and comparison of the amino acid content of the blood and of the urine may throw light on the functional capacity of the kidneys He regards dialysis as the most reliable means to remove the albumin from the serum

25 **Charcoal as Source of Error in Testing for Occult Blood**—Rapin has found that the charcoal given to mark off the feces or for therapeutic purposes is liable to prove misleading Even in minute proportions it acts as a catalyzer with the Weber, Adler and Meyer tests for occult blood He tests for occult blood by triturating in a mortar a little of the feces and solid benzidin with 1 or 2 c.c glacial acetic acid Then he adds 2 or 3 drops of peroxid of hydrogen and mixes it well. A change to a blue tint shows up even very minute traces of blood He warns that the salts of metals act as catalyzers, and hence this source of error must be eliminated beforehand Raw milk, certain ferments and certain drugs also have a catalyzing action, and with these known sources of error he now lists charcoal Even traces of charcoal may cause a misleading positive reaction

26 **Hydrorrhea During Pregnancy**—Du Pan reports three cases In two the hydrorrhea was evidently traceable to a pre-existing metritis which induced a pathologic secretion This accumulating between the ovum and the uterus wall, was the cause of the placenta becoming detached at this point This entailed slight hemorrhage and contractions of the uterus, soon subsiding under rest in bed The hydrorrhea may thus be regarded as of decidual origin in these cases, but in the third case there were traces of blood during the first two months at times corresponding to the menstrual periods, and during the following months there was a small watery discharge at these periods At delivery only two or three tablespoonfuls of fluid were found in the bag of waters He ascribes these phenomena to some slight early detachment of the placenta from contraction of the uterus at the time of the menstrual periods The membranes were evidently torn a little during this, and later at each recurrence of the time corresponding to the menstrual periods, the contractions of the uterus pumped out a little of the amniotic fluid The laceration must have been so high up that no fluid escaped from it spontaneously

27 **Thyroid Autograft.**—Kummer's patient was a woman of 36 with bilateral goiter compressing the trachea and extending outward beyond the ears Both lobes were removed nearly completely but the structure of the thyroid seemed normal at certain points, and some segments of this were implanted under the skin over the right acromion by Cristiani's technic The portion of the thyroid left undisturbed gradually enlarged as also the grafts in the acromion region A scrap of the graft was excised three years later, and the microscope confirmed that it had not only taken root but had proliferated The result, he says, was a kind of small neothyroid gland which had apparently shared in the total functioning of the thyroid gland Nine years later, that is twelve years after the operation another scrap was excised, and the findings confirmed that the graft had continued its functioning No sign of inflammation had been observed at any time The case is illustrated

32 *Addison s Disease in Girl of Ten G Rutelli
33 Present Status of Treatment of Spasmophilia O Cozzolino

29 **Lymphogranulomatosis in Child**—The history of infantile lymphogranulomatosis is reviewed and a case described with illustrations of the necropsy findings The patient was a girl of 5 and the disease ran its fatal subacute course in seven months with high fever and anemia but no hemorrhagic tendency The histologic findings are discussed with much detail, comparing them with similar cases on record The lungs showed miliary tuberculosis and atypical tuberculosis was evident in the lymph glands in the neck and lungs, lumbar and aortic regions and mesentery Canelli adds a bibliography with titles in full of 159 articles on the subject, including a number from America

31 **Operative Treatment of Congenital Stenosis of the Pylorus**—Hirschfeld writes from Zurich to extol the benefits of Rammstedt s operation in rebellious cases of congenital

spastic stenosis with hypertrophy of the pylorus She discusses the clinical picture and the various other measures that have been proposed to correct it Rammstedt applied Weber's partial pyloroplastics in 1911, but found that the vomiting kept up afterward In later cases he refrained from suturing the flaps and merely fastened a piece of omentum between them This modification solved the problem, and the operation has proved unfailingly successful in his and others' hands The musculature of the pyloric ring is incised lengthwise down to the mucosa, without opening the latter The lips of the incision are not sutured, the pylorus is reduced and the abdomen closed In the three cases reported the children were all males, all but one breast fed, and the signs of the stenosis became apparent the second or third week The two preceding children in one of the families had also had this congenital stenosis of the pylorus One succumbed and one recovered under internal measures alone In all the cases the Rammstedt operation proved simple and harmless, even in the great debility of these children, and it was undoubtedly a life-saving measure

32 **Addison's Disease in Little Girl**—The tendency to bronzing was first noticed at about the age of 4 At 10 it was extremely pronounced, while the blood pressure was rather low and the child was growing progressively weaker The appetite and digestion have always been good and the child has kept well nourished throughout The hemoglobin and red count are normal Tests for malaria and syphilis were constantly negative, but the Pirquet tuberculin skin test was strongly positive An older child in the family had died of tuberculosis and the little patient had a history of enlarged glands in the neck and spina ventosa The urine findings were apparently normal except for slightly subnormal figures for uric acid (0 3 1,000) and for creatinin (0.2 1,000)

41 To Protect Schoolchildren Against Malaria in Malarial Countries (Higiene antimalarica escolar) E Cacace

38 **Cesarean Section on Account of Tumor**—In Zarate's case a tumor in front of the promontory impeded delivery and he extracted the child by an incision in the lower segment of the uterus according to the Fromme-Fraipont technics The peritoneum had been sutured together above to shut off the peritoneal cavity, and the operation was extremely simple and easy, with very little loss of blood The wound soon healed, with no impairment of the movability of the uterus

39 **Paralysis from Vertebral Tuberculosis**—Jorge discusses Pott's disease in general and a typical case in particular, theorizing as to causes, treatment, etc Malignant tumors and parasitic cysts in the spine might present neuralgic, radiating pains like those in Pott's disease, but the pain is generally more intense At a more advanced stage there may be motor, sensory and trophic manifestations as with vertebral caries, but the clinical picture is quite distinct Syphilis, on the other hand, may present a practically identical clinical picture, especially as a tardy manifestation of inherited syphilis The child may be apparently healthy until approaching puberty, when the gait may gradually assume the spastic type and the spine become semirigid with exaggeration of the tendon reflexes Lumbar puncture may reveal lymphocytosis and the positive Wassermann reaction will confirm the diagnosis of tardy syphilis Roentgenoscopy should never be omitted in these cases, but does not always give decisive findings Paraplegia following an acute infectious disease generally subsides in a few weeks of repose The spine is flexible in these cases In all spinal troubles, Jorge remarks in conclusion, the surgeon should bear the possible medical affections in mind, and the clinician should never forget the possibility of vertebral tuberculosis alone or associated with other trouble

46 Lipoma in an Inguinal Hernia in a Woman. (Een eigenaardig geval van liesbreuk bij een vrouw) J H Hoogenboom

42 **Epidemic Meningitis**—Bijl is chief of the public health service and he here reviews the experiences in the Netherlands with epidemic cerebrospinal meningitis during the last ten years There were no cases known in 1914, but fifty four were reported in 1915 with a mortality of 92 per cent without serum treatment, and of 30 per cent with it The incubation period was less than three days in some and over five days in others Prussia had several hundreds of cases during this same year and England in the first seven months of the year had recorded 3,378 Bijl warns physicians in general to be on the lookout for imported meningitis, and that lumbar puncture should be done on mere suspicion of the disease The fluid is examined free of charge at the central laboratory, and the trained officials of the public health service are empowered to assist the general practitioner in doing lumbar puncture on civilians on request He suggests that the germs may linger in the accessory sinuses of the nose after clinical recovery It is wise to commence serotherapy in severe cases without waiting for bacteriologic confirmation of the diagnosis The anti serum usually should be injected daily for three days in succession, and then every day or second day One soldier recovered after six injections, one girl of 6 after four An English exchange reports recovery after seventeen injections in one case In some of the Netherlands cases the patient might have recovered under the serotherapy if it had been commenced earlier or the doses had been larger or the intervals shorter April and May are called the "meningitis months" Repeated examination seldom disclosed a carrier in the environment but one "contact" was found whose serum agglutinated meningococci, although none could be discovered in his nasal secretions Agglutination is not a positive sign of infection, but it may corroborate other signs In one family the three smaller children developed meningitis within two days No meningococci could be found in the nasal secretions of the parents and other children examined the sixth day, but the serum of all agglutinated at 1 50.

44 **The Tuberculin Ointment Reaction in Dermatology**—Carol devotes nine pages to a tabulation of the details of fifty cases of various skin affections tested by the Pirquet tuberculin skin test and the Moro percutaneous tuberculin ointment test A specific reaction was obtained regularly with lichen scrofulosorum, occasionally with tuberculids and repeatedly in the one case of lichen nitidus With syphilids, the tests were usually negative, but occasionally a positive response was elicited He reports further much benefit from the tuberculin treatment according to the Sahli-Ponndorf technic in cases of papulonecrotic tuberculids and of erythema induratum, although with the latter the bed rest was undoubtedly an important factor in the improvement.

FURTHER REFLECTIONS OF A MEDICAL TEACHER *

W T COUNCILMAN MD
BOSTON

The occasion brings to my mind an address which I heard, not in this noble hall, but in the building on the corner of St Paul and Saratoga streets, nearly forty years ago I had just graduated at the Maryland University, was working in the laboratory of Newell Martin in the Johns Hopkins University, and had come under the spell of the man and the place. The address by S Weir Mitchell a name equally renowned in medicine and literature, both in the subject matter and the grace of expression, made a deep and lasting impression on me I very well remember the general subject concerned the renewal of the tissues, particularly the nervous tissue, after too great wear, and he showed the importance of exactly determining, not so much the nature of the disease as the condition of the diseased individual He spoke also of the use of rational, but not necessarily pharmacologic, remedies, among which rest occupied a prominent place, to assist in the restoration to the normal It was a view of disease which the medical student at that time did not have revealed to him, but which has now become fully recognized I regret that I cannot hope to say anything that will be so remembered

Some years ago, and the years now pass with such accelerating rapidity that the period seems remote, I gave an address entitled "Reflections of a Medical Teacher" Now, having attained greater age, a wider experience having given more material to reflect on, and having possibly wasted much time in reflection, to which I always devote a very delightful ten minutes after breakfast, I propose to speak to you today "On Some Further Reflections of a Medical Teacher" I find that my reflections follow along much the same lines as in the former address, though the views expressed there have in some cases undergone some alteration and repair, and in others have become deeper and stronger

In teaching one is concerned, first, with the material, just as a farmer must consider first the character of the soil he tills, virgin soil, moreover, rarely presents itself to his hand, his fields have been tilled by previous possessors, sometimes the process enhancing, often injuring, the quality of the land, and what he does is influenced by the previous culture Continuing the agricultural simile, we are secondly concerned with the tiller, his selection and training and his ability for his job The third point is what sort of a crop he wishes to produce, and the fourth, what methods of culture he pursues

During the thirty-five years of my life as a teacher I have come into pretty close relations with a large number of young men from all parts of this country, and a few from foriegn countries, of the average age of over twenty-three and representing all kinds, both as to degree and quality of intellectual tillage It seems almost absurd and indicative of a very faulty method in our educational system that these men should not earlier acquire the training which is supposed to fit them for the serious work of life

While this is not the time when we should regard everything in the German system, as judged by some of the activities resulting therefrom, as worthy of imitation, nevertheless the difference in the character of the early education in Germany as compared with ours is striking, and I think not in our favor Some years ago while visiting a friend in Germany I had the opportunity of seeing something of the German method at close range The son, a vigorous youngster of 15 who was shortly to enter the gymnasium, spent in school thirty-four hours weekly, this including two hours of field-work in botany and two hours of religious instruction In addition to this, he spent two hours daily in the evening in preparation In the gymnasium the drill is fully as strenuous, and when the boy leaves this to enter the university he is fully two and a half years ahead of an American boy of a corresponding age, his education has been conducted along rigid lines and is thorough

The boy spoken of had a fair knowledge of French and English and had been drilled in Latin to an extent that he was able to carry on a conversation with his father in that language In history he was thoroughly steeped in that of the German Empire from the Treitsche point of view, but of the wider aspects of history he had little His point of view had been absolutly formed for him and he had imbibed the Treitsche principles as a part of the sermon on the mount What particularly interested me was his outdoor education, as revealed in the course of a long tramp we had together in the mountains, and which he had acquired as a part of his school-work He knew the plants, the trees, the geology and topography of the country, the traditions and history associated with the region, and with and through this knowledge had acquired a love of home and country which we rarely see Of athletics, he had the gymnastic drill in the school, which seemed to keep his body in good condition

The religious instruction was obligatory, but there was a choice between the Roman Catholic and the Protestant point of view The father talked to me seriously about the choice, and had concluded, not

---

* Address delivered before the Medical and Chirurgical Faculty of Maryland

from the point of view of conviction, but from that of the material advantage to his son, that, since he might possibly enter into the Austrian service, it would be better for him to choose the Roman Catholic side Of course the disadvantages of such a system as this, in which the boy at the period of lasting impression is rigidly trained in a system which has the state and not the individual primarily in view, are sufficiently obvious, but these disadvantages are not necessarily associated with the system There is no reason why the historical and political instruction should not be as free as the botanical

My reflections have led me to believe that it is in these early years that our educational system is most defective and will be most difficult to remedy In contrast with this German boy, I think also of another friend's son, a boy with whom I was accustomed to talk when on my way to a club, where at stray times I endeavored to play golf The boy, 16 years of age, pursuing his studies at a private school which prepared boys for college, played a fair game of golf and could talk of the game with some degree of interest, but knew nothing of its historical development or of the physical principles involved in its pursuit Apart from a very superficial knowledge of one form of athletics, he seemed to have acquired little or nothing, indeed, I could not ascertain that he had ever voluntarily read a book This early education is of vital interest to the teachers of medicine, for, in the first place, the age period at which men enter into medicine must be lowered, and the colleges can not turn out men with the training we require from the material they receive There would seem to be hope in the large private schools of the country, but none of these could exist if they made adequate demands on their students, and there is, furthermore, a lack of properly qualified teachers

There is no profession of teaching in this country and there are no rewards, either pecuniary or in position, on which such a profession could be based Even in the private schools teachers are selected rather on a basis of athletics and social qualifications than on the ability to train and inspire youth The possession of a "Ph D " is also regarded as one of the desirable qualifications of a teacher, it looks well in school catalogues and certainly should not be held to be detrimental, but the character of work which the degree demands in no way qualifies a man to teach How much better it would be for him to spend the time under a competent master in the study and practical exercise of teaching Every one engaged in the tillage of the soil must study its character

During a part of my teaching career my class included both those who had passed through college and had acquired the A B degree and those who entered the school after fulfilling certain more or less definite entrance requirements Harvard having required the A B degree as a condition for entrance into the medical school since 1900,[1] my experience has been more extensive with students who have the degree As far as I have been able to learn by careful study of results, on the whole the A B men are the better In judging the material of college training one cannot say offhand whether the better material which comes from the college is due entirely to the training received there The college has a certain advantage in that its material represents a selection It embraces the congenital rich, others whose immediate forebears by the exercise of energy and thrift have accumulated sufficient means to give their sons a college course, and a large number of young men who by great sacrifices and hard work earn the money necessary

On the whole, the hereditary element also will favor the college man There are differences in environment of the three classes, so many advantages and disadvantages connected with each, that I am not sure whether it is better for a young man to select his great grandfather to meet his college expenses, or to place the burden upon the thrifty father, or to depend on his own efforts I found also in my previous inquiry that there was little difference in the best men whether they had or had not the degree, but the average was cut down by the poor men, who were most numerous in those without the degree Much depends on how the years which the college represents have been passed, and one can easily see ways in which they may be spent as advantageously or more so than in college A man, however, does acquire in college certain traits difficult to characterize affecting his human relations and of advantage to his future career in any line whatever

As I look back on my life and the friends I have made, many of them having attained distinction, I find that a large proportion have not had the college degree It must be remembered, however, that the attainment of the college degree is becoming progressively more easy and that most of these men at present would have gone through college

I have been greatly impressed with the evidence which college men often present of a lack of thoroughness in the instruction they have received After two or more years of study of French and German, for instance, they have acquired no facility in the use of the language They are also incapable of close and accurate observation and show a singular lack of facility and clearness of description This comes out strikingly in one of the exercises of my course, in which the students are required to study under the microscope sections of diseased tissues with which they are not familiar and to give written descriptions of the conditions present I have been reading these papers now for many years, each year with a hope that is continually disappointed, for it is difficult to believe that an education of twenty-three years can show so little effect One learns almost to classify the students by the chirography This is for the most part indistinct, without character, often only the beginning of a word written out, leaving the remainder to be guessed at The matter is badly expressed, often obscure, diffuse and too voluminous The greatest lack is an unfamiliarity with the methods which even the savage would use to obtain knowledge of an object The method of analysis, the resolution of a problem into its single components, the study of these and the reassembling must be taught over and over again A boy should in the beginning be taught to write legibly and to express himself clearly and succinctly The only use students seem to know of books is to obtain by study the knowledge which is recorded within their pages, not to expand the knowledge they have acquired by the study of nature They seem to have but little enthusiasm, little curiosity to know Certainly a large part of a student's first years in a medical school is taken up with acquiring methods of study

---

[1] This has recently been modified to the extent that two years of college work are accepted, provided the standing of the student be high and the instruction of a certain character

I remember that in a discussion on the subject of the desirableness of modifying to some extent the A B requirement a well-known professor of psychology objected to the proposition on the ground that the college degree indicated the possession of culture and that the lack of this desirable commodity would place the medical profession at a disadvantage as compared with the law, for the lawyers would have the degree and culture It is possible to define culture as a state of mind which enables its possessor to recognize, appreciate and enjoy the best product of man's work in any direction, whether in literature, art or science Culture is acquired, who can say how Often when not consciously sought, and often when sought, it flees the pursuer It is probably more often associated with the A B degree than not, and in the class seeking the college, heredity and environment are fully as important elements of culture as the college course Certainly, as far as culture involves a knowledge and appreciation of literature the college men often seem to lack this part of it[2]

The men, on the whole, are conscientious, they try to work, but they are childish and those methods of instruction which are unfortunately most used in the primary schools make the strongest appeal to them They prefer assigned lessons, textbook recitations, and what are termed "quizzes" on lectures I am accustomed each year, at the termination of the course, to ask of the class a criticism of both the matter taught and the method Occasionally I have gotten very admirable, well-considered reports, containing suggestions which have been adopted with advantage As a stimulus to the class I have been excusing from examination at the end those men who have shown excellence as determined by the weekly written work This year the students have asked that this method be discontinued, on the ground that if no examination is given they would miss the valuable review made necessary in preparing for the examination Of course what I have said does not apply to the entire class, a large number of whom are all that could be desired as students, since those giving the impression of the normal are probably not sufficiently considered in estimating the average, for after all, the abnormal makes the greater impression

I have thought that something might be learned from a statistical inquiry regarding the colleges where the men were educated previous to their entry into the school To this end I have gone over the graduating classes of the last ten years, taken the standing of the men while in the school and compared this with the colleges Previously I had made the same inquiry based on the standing of the students in pathology alone The results are similar The number of educational institutions represented, 105, seems to be all-embracing, but of these, sixty-two gave us but one student apiece, and thirteen but two each Occasionally the single representative of a college is an exceedingly good man, but the general average from these colleges is low Most of our men come from the well-known colleges in New England, Harvard of course leading These men all averaged very closely, there being a difference of only 3 86 per cent in the standing between the highest and the lowest Whether such a small figure has much meaning is doubtful, although the numbers were sufficient as to do away with the effect of very low and very high standing of individuals The sectarian colleges fell 7 27 below the average of the New England nonsectarian colleges, but the whole average was not so marked as in pathology alone Here again it is difficult to say that the character of the education received in the sectarian college is alone responsible, for the college population in these is largely represented by a race which, though abounding in admirable qualities, has not been prolific in the production of men of science

The unfortunately small number of men whom we have received from the New England institutes of technology averages a little better than those from the colleges one institute bing 3 1 better It is rather interesting that the product of all these institutions should average so closely, but the methods of teaching are similar in each, and the men who go into medicine are fairly representative of the product The inquiry also considered relative standing of the men from the different parts of the country The men from New England were so greatly in excess to give but little value to the result As compared with the other localities represented, however, New England stood 1 92 higher

I still remain one of those who believe that teaching is a calling which if engaged in should be the paramount interest in life, that it is a responsible, serious and noble calling, and I regret the tendency which seems to prevail of disregarding teaching as a career I have become aware of this in several ways Numbers of men from my laboratory, after serving as assistants for about two years, have taken positions elsewhere In the inquiries for men from other institutions, the ability to teach, and this means much both in the way of natural qualifications and training, is seldom inquired into, or at least little stress is laid upon it in the list of accomplishments demanded for small pay

The young men themselves in seeking positions make very definite demands as to the hours which are to be devoted to teaching Their ideal seems to be a life devoted to research Why not research with teaching? Research is of fundamental importance for the teacher, the knowledge which he acquires from the study of nature is living, it is his very own and he can give it, together with the inspiration which has directed his search What a change has taken place in the point of view of teaching and research during the past forty years Research has now become dominant, it gives the individual pecuniary reward, place and position, it gives the institution reputation and endowments It has been possible to apply the knowledge which has come from research to the prolongation of life, to the alleviation of human misery, this knowledge has also made habitable large and productive regions of the earth by the destruction of endemic diseases, and has in many ways enormously increased man's power in the use of the natural forces Its pursuit conduces to pleasure and the joy of life, other pleasures pale in contrast with that which the worker experiences when the solution of a problem to which he has given concentrated effort appears at hand. This it seems to me is the real fascination which research exerts, and when this is combined with rewards so much greater than can be obtained by teaching it cannot be wondered that it makes the stronger claim.

---

[2] It is of course not to be commended that a lecturer on a medical subject should garnish his discourse with classical allusions but it sometimes is difficult to avoid it and the result is apt to be disappointing I remember that once when beginning some lectures on malformations it seemed to me eminently appropriate to begin the course by reading the first chapter of Tristram Shandy This is amusing interesting and instructive in that it gives an example of an abnormal course of development being initiated by the simple question which was propounded by Mrs Shandy As I proceeded to read the chapter an expression of utter bewilderment came over the faces, and I am sure that the bearing of Mrs Shandy's question was entirely lost. On another occasion it seemed to me that it might be well to introduce the subject by some allusion to Greek mythology by showing that such conceptions as the Cyclops the Janus and Cerberus could never have arisen as a creation of the imagination, but were based on the existence of these forms in the malformations It is very difficult to speak of the Cyclops without mentioning Polyphemus and at the name the expression of bewilderment I have so often seen passed over the faces After the first experience I asked one of the assistants if he had ever read Tristram Shandy and he said he didn t remember but he probably had for he read many books when a child

Individuals who have amassed fabulous wealth by measures which really seem simple, provided the natural endowment which makes possible their exclusive pursuit is at hand, have been led to apply parts of this wealth to the creation of institutes for research. Scientific research is a curious plant; it flourishes alike in the stony desert and in the hothouses; it is largely independent of environment and sometimes does not well bear transplantation. Under this stimulus to research, affecting the individual, the university, and the institute, it has enormously developed, to the extent that no one can keep pace with the literature in a single main subject. It is comparatively easy to increase quantity of a product, but the increase of quality is not so easy. To some of us the expression of organization of research, its creation at any spot under any circumstances, provided pecuniary means are at hand, seems rather shocking; it is true that the output of poetry and painting under such conditions might be greatly increased, but there might be some fear as to its quality. Poetry is useful to man; it has undoubtedly contributed to his happiness and has even alleviated human misery; but no magnate has ever made the experiment, which would be a very interesting one, of the creation of an institute to increase the output of this desirable product, of which the world at present is in great need.

These enormously endowed institutes can put out such a mass of research, and the primary and often sole measure is volume, that the university as a place where knowledge is advanced suffers in comparison. The institutes, moreover, attract young men in the most fertile periods of life, and offer greater emolument than the university, and freedom from what is too often regarded as the drudgery of teaching. The university, in comparison, falls somewhat behind in public esteem, and particularly so in that the institute is not disposed to hide its activities behind a modest veil. It must tell the public its accomplishments, because Croesus seeks to justify his appropriation of wealth by devoting some of it to a useful purpose. The university also seeks to meet this competition of the institute by increasing its volume of research output, and in various ways seeks to inform the public of its activities.

One leading university in the country goes so far in this direction as to publish the titles of the papers of all who have been in any way connected with it, no matter where the work was done, thus claiming that through the one time association of the author with the university this has in some way stimulated the production. The university has also created positions almost exclusively for research, which is very unfair to its teaching force, for there is too great a tendency to judge men solely by the standard of volume of output. The university has its place in training the individual by research and otherwise, toward the development of the best that is in him. The institute fills a proper place in providing facilities for research, and there are always those who will find there a suitable environment.

Teaching, however, should not be, and never has been, a bar to research, for student and teacher should seek knowledge together, and pedagogy involves so much of the unknown that to engage conscientiously in it is a form of research. Many of the great teachers I have known have been both teachers and investigators, and in both directions stimulating. There is too great a tendency to regard research and publication as synonymous. It is a laudable reputation to be known as a contributor to knowledge, and while teaching may impede publication, it is, if properly pursued, a stimulus to research. There are rewards, intangible, it is true, but the more valuable, which come to the teacher only. Who of us cannot remember certain teachers who have exerted an influence lasting through life, which has in some way made us better men?

It is difficult to attempt to define what should be the relation between teaching and research. There is at present an undoubted tendency to the separation of the two. Everything favors the man who holds research as an exclusive ideal and makes teaching a secondary consideration. There are men of wide vision, ingenious in devising methods, of great power of concentration, who are able to single out sharply the definite problems in a subject and follow them to the end, and who should find in the institute facilities for work. These men are not teachers; they aim not toward the higher development of the younger men, but regard them solely from the point of view of additional hands and eyes. They are ambitious, eager for reputation, inclined to insist on priority claims, and generally have a pretty high appreciation of their general excellence and the quality of their work. There are also men of wide culture, equally qualified for research, who are also great teachers and who teach through research. They have broader sympathies, the entire atmosphere about them is different, and even greater than their contributions to knowledge is the influence which they exert on their students. These men belong in the universities; they will find there the more congenial atmosphere, and when these rare individuals appear the university must even at the sacrifice of other things secure them and make their path easy. Teaching may also favorably affect research. A man who has made important contributions to knowledge as the head of a department in which the teaching is of the highest character told me that he finds in the review of the entire subject which the yearly course demands ever a new stimulus and fresh suggestions for the problems on which he is working.

There is another condition which one dislikes to mention and which is undoubtedly operative in the selection of teachers in a university. The university, recognizing that the salaries which it can afford to pay are not sufficient to render the recipients contented in the social environment which the position gives, rather seeks men who possess private means. That is, other things being equal, the man with private means will secure the position. It is true that the salaries given are sufficient for simple living and for family life, provided this is not too greatly extended; true also that food can be carefully selected and restricted to nutritive amounts and that the women of the household will be much happier in household employment than in social diversions, that public schools are very much better than private schools for the children, and, if so placed, that a pension is available after retirement, and the teacher need not in his life fear starvation It is, however, equally true that he cannot make these obvious truths recognized and accepted by the family Discontent, unhappiness with impairment of usefulness and loss of ideals too often result

It would be infinitely better if universities could be placed in a wilderness and withdrawn from the environment of idleness and wealth Simple tennis courts and even golf courses could be created, provided the ideals of the games were not perverted by the courts and links which wealth provides The women would undoubtedly find great diversion in the study of each other and in simple occupations Not only this, but since the university gives to society much more than it receives, outsiders would probably pay a good deal for temporary admission into the Utopia, and thus might be made to contribute to the funds of the university Such conditions are partly fulfilled in one of the great universities of Amercia, but I was not able to find that the social atmosphere differed a great deal, and that the air was always calm The trouble seemed to be that there were a few servants available and friction was excited by these being stolen from the temporarily happy possessors

What is the end sought in medical training? It is easy to say that it shall fit men to be of service in all the relations of man to disease This concerns the prevention of disease, the medical and surgical care, the social factors involved, and the human relations of the diseased individual It is impossible that all these can be fully united in the same individual, but they are all based upon knowledge and this can be attained only through the methods of science It is obvious that for this medical service a great many different kinds of medical men will be required and it remains a question how early their differentiation should begin Men will be needed in the public service to prevent disease and to take care of the sick This public service has only begun, but is sure, with the establishment of sickness insurance and other forms of social legislation in which sickness is a factor, to become prominent It will require men well trained both in the measures of preventive medicine and in the medical care of the sick At the present time the sick are most uneconomically cared for, a large part of the sickness could be prevented and the care of the sick is to a great extent inefficient and far too costly With economic conditions as they are, and there is little prospect of change, the earnings of 80 per cent of the families in the country do not suffice for much to be devoted toward recompensing medical services In the cities this condition is met by free medical service in the hospitals and by the charity of physicians

In the country districts, and it is here that the social medical service is most needed, it is not provided for at all save in certain sections Factories, mines, railroads and other large employers of labor, find it to their advantage to provide an organized medical service Ultimately the state must in some way provide a proper medical service in country communities for those who are not able to pay The schools must provide men suitable for such positions, they should be well trained in preventive medicine and capable of teaching the people the principles of right living Such physicians should be able to meet successfully medical and the simpler forms of surgical disease and to see that patients with the more serious and complicated diseases are sent to hospitals established at centers, the number of such centers depending on the relation of population to area

There must be provided capable surgeons This demands a long course of training, extending over years, in a well-ordered surgical clinic The exercise of the surgical art to obtain the best results in the more serious operations demands well-skilled assistants and attendants The operations demanded are comparatively few and such surgical clinics may be established at the hospital centers Highly trained medical men, internists, must be provided, men who are specially skilled in the cure of the diseases of children, obstetricians and specialists, and, finally, men whose work will lie exclusively in the care of the 20 per cent for whom illness is often a sad pleasure, men who understand inherited constitutions, fat reduction, and the mysteries of high finance[3] Above all, teachers must be provided

Can all this be accomplished by a medical school? Yes, provided the age period of entrance be shortened and the premedical education be better adapted to the medical needs All medical measures are based upon knowledge obtained by our senses, assisted by methods and instruments which extend their power There are many facts which can be acquired as such, but disease always presents problems to be solved It depends on so many factors which are often ill understood, which are variable in themselves and in the effect which they produce on the individual Disease, as the physician sees it, affects not classes, but individuals, and the individual case is always a problem The mere matter of diagnosis, as far as naming the pathologic process and ascertaining its situation, is to be regarded as comparatively easy, although every pathologist is aware of the number and the importance of the mistakes which are made In disease certain conditions which bring about functional disturbance are produced and life goes on under conditions which differ from the normal One of the distinguishing criteria of living matter is its variability, of which individuality is the expression, and the result of the abnormal environment of disease must differ in every individual The condition of the diseased individual, on which rational procedures of relief are based, cannot be ascertained from previous experience or from the experience of others or from generalizations, but must be deduced from the investigation of the individual There is no other road to the knowledge which gives power

Medical education must provide that the main facts of the structure and function of the body shall be firmly acquired, and also constant exercise in the study of disease and practice in methods One of the most important elements should be the recognition of knowledge and its separation from conjecture This last, of course, is making pretty large demands on the system, but something might be done at it The essential of the education in the medical school is the laboratory, a place which affords facilities for the study of things and phenomena, and in which the student can be trained in the use of his senses and in the use of instruments by which the power of the senses is increased In all the departments, in the clinics, in the hospital wards, the method is the same In the early or preclinical studies the laboratory method is of the utmost importance, for it is there that the foundation must be formed It necessitates teachers who can stimulate and extend to the students the enthusiasm in the pursuit of knowledge which they possess With the students as we receive them a large number of teachers, at least one to twenty, are required, for the students are not sufficiently developed to work independently The situation is unfortunate, moreover, in that the more help is given the students the more they require Their previous education in some mysterious way, but effectively, has robbed them of the capacity of self-dependence The unit system devised by Minot, in which the laboratory is divided into units, each consisting of a group of students under one instructor, would be admirable provided a sufficient number of capable instructors could be obtained The absence of subdivisions enables the better teachers to be more fully used Nor can the laboratory be a place for teaching alone, it must have an atmosphere, and knowledge must be sought within its walls by both teacher and student

---

[3] Lest too many should be attracted into this class of physicians it must be remembered that there are obvious disadvantages associated with the practice The life is a dull one tending to intellectual decline, and the competition with Christian Science and various forms of medical cults is keen A new element seems at present to have entered into the competition in Boston A Chinese herb doctor endowed with preternatural skill in feeling the pulse and diagnosing conditions thereby who prescribes vegetable substances by the bag is acquiring to himself the most lucrative practice in the Back Bay It has not proved possible to remove this competition by legislative enactment and with the opening of the door of China to let in the West more of the Chinese doctors may escape to bring into this country competition with Chinese medicine I mention this as a danger which has not been foreseen by those who are seeking to introduce western medicine into China

The lecture is an important part of teaching, provided its function is understood It should not be used as a substitute for objective study, but to expand and coordinate the knowledge which the student has already acquired It must also interest and stimulate The lecturer must have a present and vital interest in the matter considered, and this demands a continual renewal Once, early in my career, I wrote out with great care a series of lectures, and said at the end "There, that job is finished, I can read these lectures with some slight additions year after year" I read them once, then again, and had I been obliged to read them a third time I should have sought another occupation Curiously enough, I heard of them long afterwards At a certain function I met a prematurely old man whose hard struggle with the world had left marks upon him, who told me how much as a student he had enjoyed those early lectures, that he had obtained a shorthand copy of them, and had made them the basis of his practice In another way I became aware that copies were in existence I was testifying in a medicolegal case, sharing in the plunder which the law extracts from the community, when the astute counsel from the other side — and the law compels a witness to be on one side or the other — interrupted with the remark, "but you said otherwise," and he proceeded to read to judge and jury extracts from a well-used and rather dirty book which he said I had written It was the lectures again, and I was obliged to give the court a dissertation on the subject of lectures, and included a charge for this in the fee which the soulless corporation afterward paid

One gains an interesting experience from lecturing However good may be the descriptive power of the lecturer, however able he may be in interesting his audience, it is useless to attempt to give in a lecture information on a complex subject For instance, I doubt if it would be possible for a lecturer, taking a group of men of the average intelligence, but coming from a world in which there were no trees, to enable them in an hour to form such a conception of an oak or elm that they could go out from the lecture and instantly recognize such a tree I have arrived at this view from personal experience which may not be complimentary, I have endeavored to ascertain from students before whom I had lectured on a topic in which I was certainly interested, and they seemed to be, how much correct information they had acquired, and have found it surprisingly small in amount

The lecture should also convey a stimulus to the student, and the lecture hour should form an agreeable interruption of the laboratory work Unless the student can gain in the lecture mental recreation and stimulation, the lecture had better be left out, although it may have aspects which are not usually regarded as among its assets One is its power of inducing gentle, refreshing, noiseless sleep in the audience, and the other is the educational value of the lecture to the lecturer To one who is a poor sleeper there comes a great satisfaction to see sleep descend upon an audience The lecturer experiences an exhilaration at the demonstration of the possession of a power which makes him akin to the God "who giveth his beloved sleep" I always insist that the sleep shall be noiseless, and position makes lecture room sleep usually of this character The lecture has its value to the teacher also How often the crudity of an idea becomes strongly apparent when the attempt is made in the lecture to convey the idea to others How often have I seen a culdesac open before me, with walls so high that they could not be carried even by a flight of eloquence, and into which I was on the verge of a headlong plunge! How eagerly is a friendly alley utilized as a means of escape! The teacher should find in the lecture a means of clarifying his knowledge, and in the stimulus of lecturing, very often new and useful points of view present themselves

Next to the lecture, in ascending value, comes the demonstration, also a method of value, but of overrated value It is possible to gather a few men, not more than ten, around certain objects, point out the essential things, and enable them to see them as does the demonstrator Such a demonstration can also be made the basis of an informal talk, and questions can be asked, but at the best it is little more than a projection of the ideas of the demonstrator

Oral recitation — I greatly dislike the word quiz — by the class is also a valuable exercise provided it can be given in such a way as to bring out the conceptions which the student has formed and to correct those which are faulty It is too apt to degenerate into a lecture or into a dry matter of question and answer The student must also be shown how to use books properly and be referred to original sources of information

The absence of teachers might be helped out by the aid of student instructors, for teaching is a most valuable discipline for the student The limit of time, the pressure of the work would necessitate the student giving an additional year to the course, and the low esteem in which the teacher is held would limit the choice to those in need of the small pecuniary recompense that could be offered

The education of the medical student so vaguely suggested should give a basis on which he can further develop the various forms of medical service

The profession of medicine is a career full of interest, the social position of medical men is on the whole good, there is a general feeling of fellowship and comaraderie among them, fostered by frequent meet ings in societies It is an eminently live profession, for knowledge is constantly growing and the opportunities for service are greater than in perhaps any other Service involves also the element of combat, for there is a constant struggle against ignorance All this attracts men to it On the other hand, it is at present very greatly overstocked, the income to be derived from its exercise is small and failure is easy No man can hope to succeed in it without industry, good mental endowment and without the possession of the quality of mind which recognizes, appreciates and seeks knowledge To all this might well be added that he must have interest in and sympathy with his fellow man

Harvard Medical School

THE RELATION OF GOUT TO NEPHRITIS

AS SHOWN BY THE URIC ACID OF THE BLOOD*

MORRIS S FINE, PH D
Adjunct Professor of Pathologic Chemistry New York Post Graduate Medical School and Hospital
NEW YORK

Under the stimulus of the recently developed methods for quantitatively determining the uric acid of the blood, renewed interest has been shown in the diagnosis of gout, based on a retention of uric acid From the normal variations of from 2 to 3 mg per hundred c c of blood, the uric acid concentrations may be increased to as much as from 4 to 9 mg in gout Such increases are common occurrences in gout, but it does not follow, conversely, that these uric acid accumulations are infallible signs of gout That uric acid, as well as urea, may be retained in nephritis was pointed out many years ago by Garrod,[1] this observation being recently confirmed by more exact methods[2] It becomes essential, therefore, to eliminate the nephritic element as a factor in the retention of uric acid before the latter can be regarded as an indication of gout

BLOOD PICTURES IN GOUT AND EARLY INTERSTITIAL NEPHRITIS*

Date 1915-1916	Case	Age	Sex†	Diagnosis		Uric Acid Mg per 100 C c	Urea N, Mg per 100 C c	Creatinin, Mg per 100 C c	Phthalein 2 Hrs per Cent	Systolic Blood Pressure	Urine

3/14	G C	40	♀		Incipient nephritis	5.[illegible]	15	2.1	46	147	—	+
3/22	M S	46	♀		Gastritis	5.0	12	2.5	52	190	+	+

* Normal findings Uric acid from 2 to 3 mg urea N from 12 to 15 mg creatinin from 1 to 2.5 mg
† In this column ♂ denotes male and ♀ female

Since gout, uncomplicated by nephritis, is characterized by an abnormally high uric acid concentration in the blood without any corresponding increase in the concentrations of other nitrogenous waste products, such as urea and creatinin, it would appear possible to eliminate the nephritic factor readily by obtaining normal values for the urea and creatinin of the blood However, we have accumulated considerable evidence indicating that in the development of interstitial nephritis, uric acid is the first to be retained, this being followed by retention of urea and, lastly, of creatinin[3] It is conceivable, therefore, that at an early stage in the progress of this type of nephritis, a blood examination would show retention of uric acid only, the concentrations of urea and creatinin being normal This, it will be recalled, is precisely the blood picture regarded as characteristic of gout

In the accompanying table are recorded two groups of cases, the first composed of five cases giving the typical classical histories of gout, and the second consisting of seven cases with some evidence of incipient nephritis, such as slight albuminuria, cylindruria or diminished phenolsulphonephthalein output These patients all subsisted on a purin-free diet several days before the examinations were made The first two cases of the first group, in addition to giving the typical histories of gout, also show one or more of these signs of nephritis, and from this point of view might be classed in the second group

The blood analysis in Group 1 may be regarded as typical for gout, and those in Group 2 are what might be anticipated in very early interstitial nephritis, if our views regarding the order of retention of nitrogenous substances in nephritis may be accepted The striking similarity in the blood pictures in the two groups is at once apparent

Very close scrutiny does, indeed, indicate a tendency for the urea and creatinin concentrations of Group 2 to rise above those of Group 1 The differences, however, are slight The uric acid figures for the first group average higher than those of the second group Nevertheless, many cases of gout have been reported[4] with blood uric acid concentrations as low as or lower than the lowest in Group 2

The data here presented raise the questions 1 Is gout merely a stage in the development of *interstitial* nephritis, whose further progress may be indefinitely delayed? 2 Is early interstitial nephritis merely potential gout, in which the clinical symptoms may or may not eventually appear? 3 Is the uric acid retention of gout due to the specific condition, *gout*, or to a complicating early interstitial nephritis?

Daniels and McCrudden[5] have recently reported two cases of gout in women whose blood uric acid concentrations were quite normal Pratt[6] has reported several similar cases This would suggest the possibility that gout, unaccompanied by interstitial nephritis, may not necessarily be associated with high uric acid concentrations However, in spite of the large number of examinations that we have made, I never encountered a case such as those described by these workers

The two practical points brought out here are 1 Since uric acid is the first of the nitrogenous substances to be retained in interstitial nephritis, its determination may give the first indication of this condition when other signs are uncertain or lacking 2 Since gout and very early interstitial nephritis are characterized by essentially the same blood picture, it is necessary to employ every possible test to exclude nephritis before a high blood uric acid may be regarded as evidence of gout in the absence of the typical classical clinical manifestations

Second Avenue and Twentieth Street.

THE TREATMENT OF CHRONIC COLON BACILLUS PYELITIS BY PELVIC LAVAGE *

HERMAN LOUIS KRETSCHMER, M D

AND

FRED W GAARDE, M D

CHICAGO

It is not our object to discuss the various forms of treatment advocated for pyelitis, but to present the results obtained by pelvic lavage in this series of cases

It is well known that cases of acute colon pyelitis often clear up without medical treatment This often occurs in children Whether or not these patients may be considered as permanently cured is a question, many authors believing that pyelitis of adults, especially the pyelitis of pregnancy, is simply an exacerbation of a pyelitis of infancy, which has remained latent for years With the exception of such cases of pyelitis of pregnancy which were severe enough to warrant local treatment, pelvic lavage was not instituted in acute pyelitis

Nearly all the cases belong to the group usually designated as chronic pyelitis The question of whether pyelitis can exist without involvement of the renal parenchyma is one which always results in a good deal of discussion Undoubtedly, in a large percentage, the pyelitis is secondary to infection of the renal parenchyma this, no doubt, often clears up, so that the pelvis and ureter remain the seat of infection Instances in which this has occurred come to our notice usually without evidence of previous kidney involvement, and are grouped as cases of pyelitis

In selecting patients for treatment by pelvic lavage, it is well to bear in mind that many cases of pyelitis are associated with organic disease of the kidney, its pelvis or ureter, such as stone, stricture, dilatation and tuberculosis This group requires appropriate surgical treatment, and is not to be considered in this paper Roentgen examination, pyelography, and guinea-pig inoculations, when necessary, must be resorted to when there is doubt

When speaking of a cure, as a result of this mode of treatment, it is well for one to state just what is meant We have not discharged as cured any patient who did not fulfil two requirements First, the urine had to be free from pus, and second, cultures of the urine obtained by ureteral catheter had to be sterile To free the urine of pus was a relatively easier task to accomplish than it was to obtain sterile cultures We have repeatedly seen the urine free from pus and a disappearance of the clinical symptoms following one or two treatments, but the cultures still showed the presence of the causative organism It is evident that too much stress cannot be laid on this fact, and it is easy to understand why many of the cases relapse if the treatment is stopped before the cultures are sterile

As a rule, the growth of the colon bacillus was obtained readily on plain agar However, in these cases several kind of mediums were used, namely, blood agar slants, aerobes and anaerobes, plain agar and in some instances blood agar plates, and dextrose broth, in order to meet any cultural peculiarities which the organism might have In four cases we obtained growth on dextrose broth when the same specimen was sterile on all other mediums We do not believe this due to any peculiar adaptability of this certain colon bacillus to dextrose broth, but rather attribute it to the fact that several inoculations were made This conclusion was reached because the organism obtained in the broth grew readily when transferred to the mediums which had primarily given a negative culture

We emphasize, therefore, the importance of making several inoculations rather than a single inoculation of each specimen It has been our experience in this work that in rare instances the urine may contain pus and even motile bacteria, and still be repeatedly negative to culture, hence the value of staining the sediment for the presence of micro-organisms This difficulty has been encountered by other workers, and as yet has not been explained

Assuming that the colon bacilli present would grow in three days, the cultures were kept for this time, and not preserved longer for the development of slower growing bacteria When occasionally a stray colony of staphylococcus was found on a tube of culture medium, it was regarded as a contamination

In order to prevent recurrences, it is essential to relieve any focus which may be the cause of the relapse In women, for example, we had no difficulty in obtaining sterile kidney specimens long before the bladder urine became sterile It would seem, therefore, to be necessary to continue treating the bladder until it is free of the offending micro-organism Bauereisen and others have shown the direct lymphatic connection between the kidney and the bladder, via the lymphatics of the ureter, and it seems reasonable to assume that the failure to cure the bladder infection accounts for a part of the recurrences

* Read at the meeting of the Chicago Society for Internal Medicine, April 24, 1916

In male patients we were impressed with the great frequency with which we found signs of an associated prostatitis and seminal vesiculitis In one of our patients who had only one kidney, there were three distinct relapses due, we believe to failure on his part to carry out treatment for his prostatitis

As previously stated, this series deals only with chronic colon pyelitis, and most of the patients had resisted medical management Therefore, it is not our object to discuss the various drugs which have been employed in either local or internal treatment, but to state briefly the technic as it has been employed by us in treating this series of cases As a routine, a 1 per cent solution of silver nitrate was used In only one case did we use silver in stronger solution (2 per cent) It did not seem to make any difference in the rapidity in which a cure was obtained We cannot see any advantage in using a stronger solution, such as 5 per cent , recommended by Geraghty The amount of solution injected varied from 5 to 10 c c As an average, we employ between 5 and 7 c c It is of the utmost importance, when carrying out this treatment, that great care be taken to avoid a rapid filling of the pelvis and not to use too large amounts If the injections are carried out slowly and one avoids distention of the pelvis, there is practically no pain, except that incident to instrumentation In one of the cases the pelvis was irrigated with 30 c c of boric solution before the silver nitrate solution was injected This was carried out because there were large amounts of thick pus flowing out of the catheter and because of the presence of residual urine in the pelvis Small ureteral catheters were used, so as to allow the fluid to flow from the pelvis down the ureter, thereby preventing overdistention of the pelvis In some of the cases, catheters were passed into the pelvis, and, in others, only about half way The treatments were carried out once every five or six days, until the urine was sterile and free from pus

Autogenous vaccines were used in about half of the patients The internal treatment was carried out with three drugs, which were administered as follows During the first week, after the diagnosis was made, the patients were given 1 teaspoonful of sodium bicarbonate three times a day, so as thoroughly to alkalinize the urine During the second week, the soda was stopped, and in its place acid sodium phosphate was administered, so as thoroughly to acidify the urine During the second week, that is, the week of acid urine, hexamethylenamin was given, varying in amounts from 30 to 70 grains a day When the hexamethylenamin produced vesical symptoms, the amount was naturally reduced This form of internal treatment was continued during the alternate weeks, as long as the patient was under treatment The hexamethylenamin and sodium bicarbonate were not given simultaneously Our experience with other drugs has been too limited to permit of any definite statements relative to their merits

Pyelitis of pregnancy, when severe, is sometimes treated by emptying the uterus and, as a rule, the pyelitis clears up Whether or not the pyelitis is really cured is questionable With the institution of pelvic lavage in the treatment of pyelitis and its application in the treatment of the pyelitis of pregnancy, one is justified in stating that the pregnant woman should be given the benefit of this form of treatment before the pregnancy is interrupted Surgical attack of the kidney should also be considered only after a failure of pelvic lavage

In this series of cases, cystoscopy was performed on 115 patients, and the ureters catheterized for diagnosis and culture Of this number, thirty-eight proved to be chronic colon pyelitis Pelvic lavage was instituted in twenty-one cases In summarizing the results of treatment, however, we shall report on only fourteen patients, because we were able to follow this number to final results to ascertain whether or not they were bacteriologic cures The cases in which only a diagnosis was made and only one treatment was given are not considered in this report, irrespective of the disappearance of the subjective symptoms or the disappearance of pus from the urine Of the fourteen patients treated by lavage, bacteriologic cures were obtained in eleven cases In the remaining three, it was possible to obtain positive cultures from the ureters, although subjective symptoms and leukocytes in the urine had long since disappeared

The number of injections required varied In four cases, one injection was given, in five cases, two injections in three cases, three injections, in one case, four, and in another, eight injections

CONCLUSIONS

1 From our results in this series of cases, we believe that pelvic lavage gives a greater number of bacteriologic cures in a shorter space of time than any other form of treatment It is important that the urine be sterile, in order to prevent recurrences

2 In several instances, we obtained sterile urine after one or two treatments of patients who had been on internal treatment for many months

3 If patients fail to respond to this form of treatment, we may be dealing with a condition other than a simple pyelitis, for example, tuberculosis, stone, or stricture of the ureter

Sectionalism.—During all medical history there has never been a time when the difficulties of the profession were greater than they are today, when it was more imperative that it should stand with an undivided front. We are in a transition period of unprecedented gravity The social order of things is being changed The system of workman's compensation is but one manifestation of the social revolution that is quietly but resistlessly going on These changes are rooted in a profound sociologic movement of world-wide extent In the British Empire and on the Continent they are farther advanced than they are with us They cannot be stayed, but they may be directed, and it behooves the medical profession to be alive to the changes going on and ready as an undivided body to meet them Never has the need of unity been greater If the profession shuts its eyes to these conditions and relapses into a state of guerrilla warfare within itself it will suffer irreparable harm It is time that it woke up and came to itself and ceased bickering over nonessentials This social revolution is profound in its nature and goes to the very foundation of organized modern society The medical profession while gravely affected by it, is but a factor in its causation This cannot be too strongly impressed on medical men We are in the grasp of powers wholly outside of our profession powers that run as deep as society itself Our present state of disquietude is not due to one or to a few superficial causes alone Organizations which seek to remedy our ills by gross commercialism, by vituperation and indiscriminate attacks on everything and everybody, are foredoomed to failure Their outlook is narrow erroneous and futile—*New York State Jour of Med*, February, 1916

INTRACRANIAL TREATMENT OF SYPHILITIC AND PARASYPHILITIC OPTIC NERVE AFFECTIONS

PHYSIOLOGIC EVIDENCES RESEARCHES ON INTRAVITAL STAINING OF THE OPTIC NERVE *

I INTRODUCTION

This paper is a report of experimental work pursued with the intention of finding a more efficient method of reaching the optic paths by curative agents, and ventures to suggest another way of treating optic nerve affections of syphilitic nature, which do not respond to the classical antisyphilitic treatment

During an experimental study of a certain phase of ocular anaphylaxis, I learned that I could not produce an anaphylactic condition of the optic nerves in dogs by repeatedly injecting a foreign serum into the spinal canal, a supposedly good route of reaching various parts of the central nervous system My failure prompted me to ask the following questions

1 Does the foreign serum introduced into the spinal canal ever reach the optic nerve?

2 If the serum does not reach the optic nerve, does the medication, introduced intraspinally for intracranial conditions like general paresis, primary optic atrophy, etc, reach the cortex of the brain or the optic nerves?

3 If the foreign serum and medication introduced into the spinal cavity do not reach the optic nerves, what would be a good way of bringing into contact these substances with the visual paths?

The answer to the last two questions, a by-product of my study on anaphylaxis, constitutes the central idea of this paper It is superfluous to dwell at length on the importance of this problem The so-called primary optic atrophy is to the ophthalmologist what general paresis is to the neurologist, one of the saddest conditions to be contended with It is by no means a rare affection According to Uhthoff,[1] 9 per cent of tabetics and 8 per cent of paretics get optic atrophy, and 2 per cent of paretics get optic neuritis From 10 to 20 per cent of all postmortems in tabetics show changes along the optic paths Fifty per cent of patients with cerebral syphilis have an involvement of the optic nerves, chiasm or tracts Thirty-seven per cent of all optic atrophies are in tabetics, and from 60 to 100 per cent of tabetic optic atrophies are syphilitic Our latest textbooks on ophthalmology are very reticent regarding the success in the treatment of primary optic atrophy Everywhere, in books as well as in our own experience, we gather that failures amount to almost 100 per cent Why? Is there really no way of reaching and treating such optic nerves?

The therapeutic problem is as difficult as it is important There is no doubt that tabetic and paretic optic atrophies are of syphilitic nature Why, then, do these conditions not respond to antisyphilitic treatment?

Anatomically, the optic nerves are very similar to the brain In both we find a parenchymatous tissue with two systems of irrigation serving the double purpose of nutrition and drainage blood vessels and spaces for the circulation of cerebrospinal fluid

Pathologically, the optic paths as well as the rest of the central nervous system react to the syphilitic virus in almost identical manner The changes appear mainly either in the interstitial tissue, blood vessels and meninges, or they are localized mainly in the parenchyma, ganglia cells of the cortex or of the retina and in the nerve fibers of the central nervous system or of the optic nerves We deal with an interstitial or with a parenchymatous syphilis

Therapeutically, we find the same striking similarity between the optic paths and the rest of the central nervous system In both, the interstitial syphilis does respond, and the parenchymatous syphilis (paresis and primary optic atrophy) does not respond to antisyphilitic treatment

Bacteriologically, there is no difference between tabes, general paresis and the cerebrospinal syphilis Spirochetes have been found in the central nervous system, cerebrospinal fluid and blood of tabetics and paretics, and have been cultivated, thus proving their viability and virulence There can be no doubt that spirochetes, and not "toxins" alone, are the causative factor of syphilitic "primary" optic atrophies The fact that the micro-organisms have not as yet been demonstrated in the tissue of the atrophied optic nerves is just as little evidence against their existence there as was the fact that no spirochetes were demonstrable in the brain of paretics before the days of Moore, Noguchi and Levaditi, an evidence that they were absent in such brains

The ideas from which we have to start in handling the problem of treatment of the so-called metasyphilitic, primary optic atrophies (in tabes, general paresis and some cases of cerebrospinal syphilis) would be about as follows

1 The condition is due to spirochetes

2 The syphilitic optic nerve affections are to be considered and treated in the same light and by the same methods as are the syphilitic manifestations of the rest of the central nervous system

3 The general antisyphilitic treatment as administered before the era of intraspinal medication failed in a large percentage of cases, and always failed in parasyphilis of the nervous system and of the optic nerves

4 The intraspinal method proved the efficacy of direct, local application of drugs on syphilis of the spinal cord

5 What could we do in order to apply the antisyphilitic medication directly on the spirochetic affections of the optic nerves?

In order properly to grasp the last sentence, the main subject of this paper, it is necessary that the anatomic, physiologic and pathologic facts in connection with our problem shall be briefly stated I shall, then, relate the experimental attempts and finally discuss the therapeutic suggestions to be drawn

II THE VENTRICULAR-SUBARACHNOID-PERINEURONAL SPACES OF THE CENTRAL NERVOUS SYSTEM AND OF THE OPTIC NERVES

Of the three meningeal sheets enveloping the central nervous system and the optic nerves, the arachnoid concerns us most It is described (Cunningham[2]) as a thin, transparent membrane, which envelops both the

brain and the cord between the dura and the pia mater The cranial part of the arachnoid bridges over the inequities on the surface of the brain, and does not dip into the various fissures and sulci of the brain as the pia mater does The spinal subarachnoid space is wide and partially subdivided into compartments by three incomplete longitudinally arranged septa It is continuous with that of the cranial cavity and with the ventricles of the brain

Summary The outer and the inner (ventricular) surface of the brain and of the spinal cord, the outer surface of the optic nerves, the perivascular spaces penetrating into the brain tissue and into the septa between the optic nerve bundles, and probably the spaces between the cells and possibly those between the nerve fibers (perineuronic spaces) form a system of spaces and channels which we may call the ventricular-subarachnoid-perineuronic system This system is full of cerebrospinal fluid which serves to nourish the nervous parenchyma, and drains off its products of metabolism

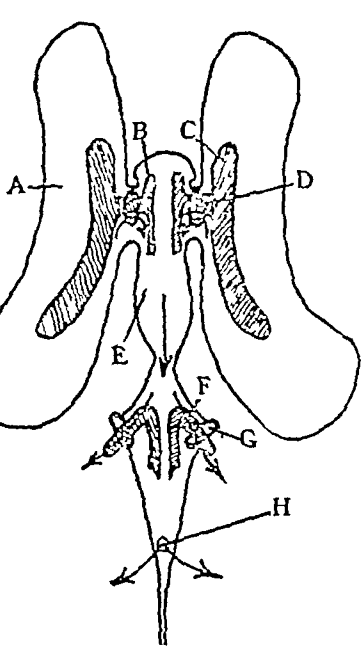
It is into this fluid that we have to introduce our medication if we intend to reach the nervous tissue itself

III THE CEREBROSPINAL FLUID

Function — The cerebrospinal fluid is the medium of exchange between the blood in the capillaries and the neurons of the central nervous system

It equalizes the pressure throughout the whole craniospinal cavity, acts as a water cushion, especially at the base of the brain, protecting the vital structures of the medulla from concussions, and maintains uniform equalization of the blood supply elements during the rhythmic variations of respiration and circulation (Mott[4]) It is the medium of conservation of the cellular excitability

Distribution —Mott[4] has demonstrated the existence of a system of canaliculi surrounding the neurons and the capillaries of the brain which is in direct communication with the subarachnoid space Wegefarth[7] has obtained similar results from his study of the retinal neurons, these perineuronic spaces communicate with the optic nerves The cerebrospinal fluid is distributed in the large spaces (ventricles and subarachnoid) as well as in the perineuronic spaces all over the central nervous system



Schema showing general disposition of the ventricles in the brain and the choroid plexuses circulation of the cerebrospinal fluid in the ventricles (after Mestrezat) *A* lateral ventricle *B* plexuses of third ventricle *C* plexuses of the lateral ventricles *D* foramen of Monro (between lateral and third ventricles) *E* third ventricle *F* plexus of fourth ventricle *G* foramen of Luschka and *H* foramen of Magendie (points of communication between fourth ventricle and subarachnoid space) Arrows show the direction of flow of the cerebrospinal fluid in the ventricles.

The cerebrospinal fluid has a double origin the choroid plexuses and the perineuronic spaces It is very rapidly reformed after a lumbar or ventricular puncture This demonstrates the active secretion of the cerebrospinal fluid

Circulation —The cerebrospinal fluid is not stagnant The reasons in favor of the idea that this fluid is in continuous motion are very plausible Fluids are not compressible. Consequently, during each systole and expiration, when a larger amount of blood is in the cerebrospinal canal the cerebrospinal fluid has to be temporarily and rhythmically displaced

Since we accept that the main sources of the production of the cerebrospinal fluid are the choroid plexuses and the perineuronic spaces, we have to admit that the directions of flow will be, on the one hand from the lateral ventricles into the third, then into the fourth and from there into the subarachnoid spaces enveloping the brain, cerebellum and spinal cord, and, on the other hand, from the perineuronal spaces along the perivascular sheaths into the subarachnoid spaces

In spite of these anatomic reasons, Mott, based on Golla's beautiful experiments, believes that there is a current of cerebrospinal fluid, starting from the subarachnoid spaces toward the perineuronic canaliculi We shall see later, in discussing therapeutic considerations, the immense importance of such a conception

Drainage or Resorption —The cerebrospinal fluid, being continuously secreted, has to be steadily drained off

Which are the paths of resorption of this fluid? Most of the physiologists, American and English, admit that the main avenue is the venous system of the craniospinal cavity, and the accessory avenues are the lymphatics along the craniospinal nerves But voices of dissension are raised by no less an authority than Goldmann,[11] who believes that the lymphatics play the principal role of resorption, and Mott,[4] who suggests that the fluid is drained off mainly into the cerebral capillaries

Cushing,[9] Weed,[8] Frazier and Peet,[12] Dandy and Blackfan,[13] Reiner and Schnitzler have conducted such conclusive experiments that there could be no doubt that the larger part of the cerebrospinal fluid drains off into the sinuses and venous plexuses of the cerebrospinal cavity, and that a very slow process of filtering takes place along the lymphatic system of the cranial and spinal nerves The practical significance and application of this physiologic fact will be discussed in the consideration of therapeutics

Permeability —The choroid plexus is a very efficient barrier against the permeation of substances introduced into the blood Chlorids, bromids, iodids, nitrates, ferrocyanids, salicylates, acetates, methylene blue, fluorescin, biliary pigments, mercury and arsenic, do not penetrate normally into the cerebrospinal fluid (Mestrezat,[6] Sicard[14]) Volatile substances like ether, chloroform and curiously enough hexamethylenamin, pass into the cerebrospinal fluid The choroid plexus and its lining seems to have a selective power and does not give passage to the antisyphilitic drugs into the cerebiospinal fluid (Ballance[15])

In typhoid, the agglutinins found in all the humors of the body are not present in the cerebrospinal fluid Toxins, hemolytic amboceptors, are also absent from the fluid, while they may be found in large amount in the blood

Staining substances like methylene or trypan blue when injected into the blood do not pass into the cerebrospinal fluid This power of retention by the choroid plexuses of substances injected into the blood stream is another very important point to be considered in our further discussion of the subject on therapeutics

IV EXPERIMENTS ON INTRAVITAL STAINING OF THE OPTIC NERVE

This part of my paper is concerned only with the relatively simple problem of solving by the intravital staining method, first, whether the spinal injections are an effective procedure of reaching the optic nerve and, second, which is the best method of staining the optic nerves intravitally

AUTHOR'S EXPERIMENTS

A Does the optic nerve stain when trypan blue, methylene or a suspension of very fine particles of coal is injected into the blood, spinal canal, cranial subdural cavity or lateral ventricles?

B Which is the best route and method for vital staining of the optic nerves?

One cat, two rabbits, and twenty-five dogs were used Injections were made into the veins, spinal subarachnoid, cranial subdural space and lateral ventricles In two animals, methylene blue aqueous solution was the substance injected, in the rest, trypan blue (1 per cent) in normal salt solution or in ox serum

For spinal injection, a long spinal needle was introduced into the lumbar region, after cerebrospinal fluid ceased dripping, a variable amount of staining fluid was very slowly injected

For cranial subdural injection, the skull was trephined about 1 cm to the right side of the median line, over the parietal bone The needle was carefully introduced under the dura and the fluid injected

For injection into the lateral ventricles, the needle was introduced perpendicularly through the trephine opening into the ventricles, after cerebral fluid ceased dripping, staining solution was very slowly injected

The animals were killed by chloroform or ether, postmortem examination immediately after the injections, or several hours, days or weeks later

Group 1—Two dogs were given an intravenous injection of 50 c c of methylene blue solution, 2 per cent The postmortem performed right after the injection revealed no trace of stain in the cerebrospinal system

Group 2—Two rabbits and one cat were treated by a cranial subdural injection of trypan blue solution One rabbit killed immediately after the injection exhibited a staining of the meninges of the entire cerebrospinal system The other rabbit, killed three days, and the cat two days after the injection showed no staining of the meninges (only a blue mark on the dura of the cat in the vicinity of the injection) What became of the stain? This is an interesting problem to be investigated further

Group 3—Twelve dogs received intraspinal injections of a 1, rarely a 5 per cent solution of trypan blue or lampblack suspension The amount varied between 2 and 32 c c The postmortem was performed from ten minutes to twelve days after the injection In eleven animals the meninges of the spinal cord, and on some of the cerebellum and of the medulla oblongata were more or less stained The optic nerves were not stained

Group 4—Seven dogs received injections of trypan blue solution, and one dog an injection of lampblack suspension into the lateral ventricles The amount of fluid ranged from 1 to 24 c c, and the postmortem examination was performed, on some, from fifteen to thirty-nine minutes, on others, two to three hours, and, in still others, five to seven days after the injections All the animals had the meninges of the entire brain and spinal cord and of optic nerves very intensely stained

Microscopic Findings—Specimens of chiasm, optic tracts, optic nerves and the posterior pole of the eyeballs of two dogs were examined microscopically

Dog 1 had received an intraventricular injection of trypan blue and was killed two hours and five minutes later

In the optic nerve section the microscopic specimens showed the pia deeply stained in diffuse fashion together with the more superficially placed septa between the nerve bundles Vessels lying in the outer third of the nerve showed considerable of the stain in the walls, the intima cells of these vessels were stained faintly blue The central two thirds of the nerve showed none of the dye anywhere The arachnoid stained a pale blue purple, rather diffusely, its blood vessels taking on a still paler tinge

In the chiasm section, the condition was substantially the same as in the optic nerve, except that the stain was everywhere less intense

No trace of stain was found in the retina or other parts of the eyeball

Dog 2 had been treated by an intraventricular injection of 1 c c of lampblack suspension, and was killed seven days later The microscopic specimens showed the optic nerve fibers free from pigment In the superficial layers on the pia there was a thin, irregular band of pigment There were some scattering pigment spots in the surrounding areolar tissue (arachnoid spaces), The pigment did not penetrate the optic nerve at all The blood vessels of the pia and arachnoid were free from pigment, there was no tendency to enter the perivascular sheaths A section of the chiasm revealed the pia almost completely free of pigment, in spots there were considerable numbers of large and small granules crowded together, but free, not included in any cell bodies The arachnoid was somewhat hypertrophied with dilated blood spaces containing many red blood cells and many scattered clumps of pigment

COMMENT ON MACROSCOPIC AND MICROSCOPIC FINDINGS

As we have seen, the intraspinal or intravenous injection of the stain did not reach the optic nerve In intravenous injection the staining substance is retained by the choroid plexuses and cannot enter the fluid in the ventricles, consequently it has no way of reaching the optic subarachnoid space In intraspinal injections, on the other hand, the anatomic and physiologic data discussed in the consideration of cerebrospinal fluid and treatment find in this research an experimental basis The fact is that, generally, the injection fluid does not go beyond the posterior cranial fossa Some investigators have found cranial nerves stained by intraspinal injections of pigment Others have obtained results similar to mine, a staining of the meninges of the spinal cord only, when the injections were made into the spinal canal The discrepancy between these findings may be explained by the different methods of injections used, by the larger or smaller amount of fluid injected, or by the higher or lower pressure used It is natural that large amounts of fluid and high pressure injections will drive the stain into the cranial cavity, but the procedure is entirely unphysiologic My experience with cranial subdural injections coincides with that of Ballance[15] and others who state that the fluid cannot be injected in any appreciable amount, and that in dogs the staining fluid does not reach the optic nerves Finally, the cranial intraventricular injections have without exception given the best results In all the experiments the post mortems showed the optic nerve sheaths intensely stained, and the microscopic findings illustrate very prettily that the course taken by the pigment was along the arachnoid and subarachnoid spaces down along the optic nerve

---

[15] Ballance Brit Med Jour, 1914, p 596

Experiments 13 and 15 constitute a beautiful demonstration of this statement In Experiment 13, a large dog's skull was trephined under general anesthesia and 2 5 c c of trypan blue injected into the lateral ventricle Immediately following this, the right optic nerve was exposed by an extensive resection of the external wall of the orbit, and the nerve watched for the possible appearance of the stain One hour and thirty-two minutes later the optic nerve began to stain bluish

In Experiment 15 the optic nerve was exposed before the trephining Two hours and eight minutes after the intraventricular injection of trypan blue the optic nerve began to stain bluish At the postmortem the optic nerve which had been exposed intravitam was more intensely stained than the other optic nerve In these two experiments I have been able to see for myself how soon the fluid penetrated from the ventricles into the optic nerves The therapeutic application of these findings will be discussed in the consideration of treatment

V PATHOLOGY OF THE SO-CALLED METASYPHILITIC OPTIC NERVE AFFECTIONS

The universally accepted view of the pathology of tabetic and paretic optic atrophy is that it consists of a primary degeneration of the nerve fibers, beginning in the retina and extending centripetally to the optic nerve Uhthoff[1] regards as a settled truth the conception that the tabetic and paretic optic atrophies are an ascending process of primary degeneration starting in the retina Ginsberg, Greeff, Grosz, Virchow, Leber, Elschnig, von Leyden, Goldscheider and others are of the same opinion Uhthoff accepts the general view that there are two types of syphilitic optic atrophies ascending (tabetic and paretic) and descending (in cerebrospinal syphilis) In the latter type Uhthoff describes the postmortem changes ranging between basal meningitis, perineuritis, gummatous infiltration in and around the optic nerve, neuritis descendens and papillitis Sometimes we find syphilitic changes in the intracranial portion of the optic nerve without the extension of the process to the orbital portion At other times the gummatous infiltration is only in the trunk of the optic nerve without involvement of the sheaths Most common is a primary process of the sheaths with a secondary involvement of the optic nerve The chiasm is a point of predilection for gummatous infiltration In other words, the optic atrophy follows an inflammatory process somewhere in or around the optic nerve or chiasm In the other type, the taboparetic, the optic atrophy is primary in nature, there is no inflammatory process anywhere in the optic nerve, the ganglion cells of the retina degenerate, and the nerve fibers undergo the same process In one type the changes begin in the blood vessels and connective tissue of the meninges and septa of the nerve In the other type the changes are primarily in the parenchyma

About two years ago, Head[19] published his very illuminating classification of syphilitic and so-called metasyphilitic conditions of the central nervous system and brought order out of the chaotic conceptions of the pathology of tabes, paresis and cerebrospinal syphilis According to Head, the syphilitic changes are either mainly in the vascular interstitial tissue or mainly in the parenchymatous tissue (ganglion cells and fibers) of the central nervous system We consequently deal with an interstitial or a parenchymatous process The first constitutes so-called cerebrospinal syphilis, the second, tabes and general paresis Along this line of thought, syphilitic optic nerve affections may be classified in the same manner, interstitial and parenchymatous In one the process begins as a perineuritis and extends to the septa between the nerve bundles In the other the process is limited to the retinal ganglion cells and extends upward into the optic nerve fibers The first one, just as in cerebrospinal syphilis, is amenable to antisyphilitic treatment, the second one, the primary optic atrophy, like general paresis, does not respond to treatment The one is due to spirochetes, the other was supposed to be due to toxins (a plausible reason why paresis and primary optic atrophy do not react well to mercury and arsenic) But the "Wassermann positive" findings in the spinal fluid and the demonstration of spirochetes in the spinal cord of tabetics and in the cortex of paretics have changed our idea about the toxic origin of these conditions Neurologists have become accustomed to think of paresis and tabes as syphilitic manifestations in the parenchyma of the nervous system due to the direct action of a certain strain of spirochetes, still spirochetes just the same, not toxins

While neurology was undergoing such radical changes, ophthalmology adhered to its conservative view that primary optic atrophy (tabetic and paretic) is due to some "toxic" substance, possibly of syphilitic nature, and the main reasons for persisting in this unfortunate view, paralyzing any new therapeutic thoughts, were first the old teachings on the pathologic anatomy of the primary optic atrophy and, second, the inefficiency of the antisyphilitic treatment

Let us see whether this classical conception of ophthalmology is really unassailable If it could be proved that the primary optic atrophy is a syphilitic *manifestation* due to the direct action of spirochetes, just as tabes and general paresis, then our feeling of helplessness would be relieved and we would enter the same road of therapeutic optimism that neurologists did lately

A careful review of the literature on the microscopic examinations of atrophic nerves in tabetics and paretics reveals that our conception of tabetic atrophy as a primary degeneration of the retinal ganglion cells is based on the finding of twelve authors (Cruveilier, Virchow, Leber, Uhthoff, Popow, Moxter, Schlagenhaufer, Elschnig, Glicksman, von Grosz, Wilbrand and Saenger) in nineteen postmortems of tabes and three of general paresis On the other hand, Keraval and Raviart[20] in 1902 and Marie and Leri in 1904 have examined microscopically the atrophic nerves in five paretics and twenty-three tabetics and described an interstitial optic neuritis (Keraval and Raviart), a meningitis and endovasculitis, and perivasculitis, followed by interstitial optic neuritis, a thickening of the pia and arachnoid around the chiasm and optic nerves very similar to the meningitis of the spinal cord in tabes (Marie and Léri) These findings show that the so-called primary optic atrophy is due to a parenchymatous as well as an interstitial process and differs *entirely from that* described by the older authors Furthermore, none of them have applied the methods of Nissl and Alzheimer to the study of the optic nerve and retina in tabetic and paretic atrophy, and Greeff[21] justly remarks that it is curious how few reliable microscopic examinations of the tabetic optic nerves we possess This gap in our knowledge has been filled by the very able studies of Stargardt[22] This author has examined the optic nerves, retinas, chiasms, tracts, brains and spinal cords of sixteen tabetics and paretics with optic atrophy in various stages, and eight normal optic nerves from the same class of patients He calls attention to the fact that the descriptions of the retina given by previous authors are not reliable because they obtained their specimens too late, long after the cadaveric changes in the retina had set in Stargardt's retinas had been fixed by injections of Birch-Hirschfeld fluid in the vitreous as early as from twenty to thirty minutes after death Both for this reason and on account of the fact that he used the latest *method of staining, Stargardt's findings are to* be considered more reliable and more in accordance with the actual pathologic conditions

[19] Head H. Brain 1914

[20] Keraval and Raviart Arch de Neurol 1902 xii, 356

Stargardt concludes from his studies that the tabetic as well as the paretic optic atrophy begins in the optic nerve and not in the retina He saw specimens of optic nerves from tabetics with beginning atrophy without any changes in the retina, and other specimens of optic nerves completely atrophic but with many normal ganglion cells in the retina He argues that if *the retina degenerated first, the opposite condition* ought to be found

The examination of the atrophic nerves revealed that 1 Nowhere were there degenerated nerve fibers to be found without a focus of exudation preceding the degeneration 2 The most common seat of the exudative process is in the intracranial portion of the optic nerves 3 In general paralysis the exudate appears in the brain and extends to the optic paths, in tabes, it appears independently in the optic paths and spinal cord Everywhere the exudative process precedes the degenerative one Stargardt is very emphatic in his belief that the tabetic and taboparetic optic atrophy is not the action of a "toxin," and his reasons seem very plausible

First, the process appears as an exudate, irregularly in various parts of the nerve, a fact which is in direct contradiction with all we know about the action of toxic substances (wood alcohol, quinin, filix mas (male fern), tobacco, etc), which always act in the same manner and on the same group of elements of the visual organ (maculopapillar bundle, retinal blood vessels, etc) Second, of all the toxic substances we know as acting on the visual organs, none produces exudative foci similar to those described in *taboparetic* optic atrophies Such foci can be produced only by micro-organisms (spirochetes) Although the presence of these micro-organisms has never been demonstrated in the optic nerves of tabetics and paretics, their probable existence in these tissues may be inferred from Noguchi, Moore and Levaditi's demonstration of the spirochetes in the cortex of such patients, and from the similarity of changes found in the optic nerves, and brain and spinal cords of these patients

If Stargardt's work is confirmed by future investigations, we shall have to modify our ideas *regarding* the pathology and pathogeny of the so-called primary optic atrophies These atrophies will cease to be called "primary" because they are secondary to an inflammatory focus somewhere along the optic nerve They are not toxic in origin, most probably they are due to the direct action of the spirochetes These micro-organisms are carried to the optic nerves along the cerebrospinal fluid, blood stream and by contiguity along the meninges They reach first the sheaths and the septa of the optic nerve wherever there are blood vessels and cerebrospinal fluid Later on they penetrate the neuroglial envelopes of the nerve bundles and safely lodge themselves where neither blood nor medication can reach them, at which stage of the game we become entirely powerless

The importance of this conception cannot be overestimated, its influence on the therapeutics of syphilitic and parasyphilitic optic atrophies cannot be denied It is only a matter of time to work out the two main questions early diagnosis, while the spirochetes have *not as yet entered the interior of the nerve bundles,* and the effective treatment

VI TREATMENT OF TABETIC AND PARETIC OPTIC NERVE AFFECTIONS A SUGGESTION

In 1902 at the Medical Congress of Cairo, Bouchard made the significant statement that in both local and general diseases which are localized, if a general drug treatment exercises a specific cure, one might as well confine the administration of the remedy exclusively to the diseased tissue and attempt the cure by injecting the medication into the affected part

In case of acute articular rheumatism, a man weighing 135 pounds, who takes every day by mouth 90 grains of sodium salicylate, sees all his joints clearing up Every day a grain of the drug has entered into every pound and a half of his body and, of course, a very small proportion of this has found its way into the soft parts surrounding the affected joints Bouchard claims to have cleared up acute articular rheumatism by articular injections of extremely small quanti*ties of sodium salicylate*

In syphilis the instances in which local treatment, besides the general treatment, is absolutely necessary to effect a cure are numerous Bouchard recites several such cases

A man with an ulcerating gumma of the back had been treated by mercury and iodids without any visible results A few injections of a potassium iodid solution around the gumma healed the ulcer in a very short time

A woman with deeply ulcerated condylomas distributed over various parts of the body did not get relief by a prolonged general antisyphilitic treatment Injections of potassium iodid and mercury biniodid were begun, and the ulcer under the treatment disappeared in three days Another ulcer disappeared promptly after six injections The condylomas which were not treated did not undergo *any change*

Local application of the specific drug, says Bouchard, brings it in direct contact with the affected *tissue* and acts without being diffused throughout the *entire* organism, where it may cause *symptoms of* intoxication

Bouchard's ideas regarding the topical treatment of certain localized diseases have found their *justification* in our present experience with the intraspinal treatment of cerebrospinal syphilis

[21] Greeff Pathologische Anatomie des Auges

[22] Stargardt Arch f Psychiat, 1[illegible]1

Local Therapeutic Application in Certain Conditions of the Nervous System—In patients with purulent meningitis, Flexner[23] has demonstrated the necessity of bringing the therapeutic serum directly into contact with the meninges by spinal subarachnoid injections

Swift and Ellis[24] have cleared up syphilitic changes of the cerebrospinal fluid (pleocytosis, excess of globulin and positive Wassermann) by intraspinal injections of salvarsanized serum in patients in whom general treatment had completely failed

Sicard[14] and others have shown how next to impossible it is to have the choroid plexuses transgressed by drugs introduced into the organism by mouth, skin general circulation, etc It has been found that at the appearance of the first symptoms of experimental tetanus, subcutaneous injections of antitoxins have no influence on the progress of the disease, while the local application of the antitoxin right to the central nervous system has a most beneficial effect on the tetanic manifestations

Horsley[25] challenges any neurologist who can affirm that a gumma of the cerebrospinal system has ever been cured by a general treatment with mercury after the classical method

Gowers long ago insisted on the fact that cerebral syphilis does not respond fully to the classical antisyphilitic treatment, and that after some subsidence it shows recurrences Horsley agrees with Gowers that in many cases of gumma, pachymeningitis and syphilitic optic neuritis we do not obtain good results by the classical mercury and iodid treatment

We see on the one hand, therefore, clinicians of the caliber of Horsley and Gowers declaring the ineffectiveness of the old way of treating certain conditions of cerebrospinal syphilis, and on the other hand authorities like Sicard, Flexner, Swift and Ellis and their large following asserting the marked effectiveness of the application of the medication right on the cerebrospinal system

Best Method of Reaching the Central Nervous System With Our Medication—In a previous chapter it has been shown by experimentation that the cerebrospinal fluid, which is the ambiant medium of the neurons of the central nervous system, cannot be reached by any other than the subarachnoid route It follows that, since we admit that certain conditions of the central nervous system do not benefit by the administration of drugs by mouth, skin, blood, etc, we have to try the direct introduction of the curative agent into the cerebrospinal fluid Through this medium the agent has more of a chance to reach the affected central neurons Swift and Ellis have been perfectly logical in their intraspinal treatment of syphilis of the central nervous system

Failure of Intraspinal Medication for the Treatment of Intracranial Syphilis—Expectations, however have only partially been realized While various syphilitic conditions in the spinal cord and tabes have sometimes improved marvelously under the influence of intraspinal injections, intracranial conditions and mostly optic nerve affections of syphilitic nature did not respond to this treatment

Noguchi and Moore's discovery of spirochetes in the brains of paretics has given a strong impetus to the intraspinal application of antisyphilitic drugs for general paresis, but the hope of those who tried this method of treatment has been completely disappointed In the United States, Cutting and Mack, Markland, Beling, Wardner,[26] Mapother and Beaton, and in Europe, Wechselmann, Kleist, Marinesco,[27] Marie, Levaditi and Sicard [28] have treated a number of paretics by intraspinal injections, and the invariable result was failure This failure had to be explained

Why does salvarsanized serum act well in a fair percentage of spinal syphilis and fail to give any satisfaction in an intracranial syphilitic condition, like general paresis?

The answer may be simple The salvarsan introduced into the spinal canal does not reach the cranial contents (brain and optic nerves) Disappointing as this may sound to us, it is a fact sustained by both clinical and physiologic experience

We have seen that small quantities of soluble and insoluble substances injected into the spinal cavity do not reach the brain or optic nerve The pigment is anchored by the tissues in the immediate vicinity of the injected area and stains it What is left diffuses upward, but is again taken up by the sheaths of the spinal cord, and there remains only a minute quantity of the substance injected, to reach the base of the brain, where it is anchored by the meninges in their turn Nothing or almost nothing is left for the cortex or optic nerve

The same thing happens with the mercurial or salvarsan solutions introduced into the spinal canal It could not be otherwise, since the salvarsanized or mercurialized intraspinal injections work very well in spinal syphilis, mostly in meningeal conditions Were the medication not anchored there, it would not have any beneficent effect That cocain or its derivatives injected intraspinally are almost instantaneously anchored by the spinal cord in the vicinity of injection is a fact which has been known for quite a long time and it illustrates very well the way intraspinal medication acts, when it has a chemobiologic affinity for certain tissues

Another reason why the spinal injection does not reach the brain cortex and optic nerves is that the fluid would have to rise against the current It is generally admitted that the center of secretion of cerebrospinal fluid is in the ventricles In leaving the fourth ventricle it flows in various directions, upward around the brain, outward around the cranial nerves and into the venous sinuses, and downward into the spinal canal The intraspinal injection has to be made under considerable pressure in order to overcome the downward tendency of the cerebrospinal fluid The anatomic configuration of the subarachnoid spaces in the convexity of the brain and around the optic nerves explains the difficulty under which a spinal injection is laboring to reach the intracranial tissues The greatest portion of the cranial subarachnoid space and that of the optic nerves is a spongy tissue consisting of an infinite number of cells intercommunicating with each other and separated by more or less delicate trabeculae The circulation in these spongy tissues is naturally not as free as in the cisternae, ventricles or spinal canal An injection of medication may diffuse with ease in the free subarachnoid room, but with great difficulty in the spongy spaces of the convexity of the brain and surface of the optic nerves

[27] Marinesco and Mirea Rev neurol. 1913
[28] Sicard Jour med franç 1913

As we see, experimental research, physiologic considerations and anatomic arrangement of the subarachnoid spaces all argue against the efficacy of spinal medication for intracranial syphilis

A similar reasoning could be used for the discussion of the treatment of the so-called *metasyphilitic* optic nerve affections (tabetic and paretic optic atrophies) Antisyphilitic treatment of the so-called primary optic atrophy in tabes and paresis has invariably been a failure *in the hands of ophthalmologists* Mercury has been found to act *injuriously* on such nerves Intraspinal injections have not been a success The question may be repeated, Why does a parasyphilitic affection of the optic nerve not respond to treatment? The answer is the same as before The medication does not reach the optic nerve, or if it ever reaches it is in such a small quantity that it has a rather stimulating (?) action on the growth of the spirochetes Consequently, the spinal medication is not and cannot be efficient in the treatment of metasyphilitic or parenchymatous optic nerve affections It is rather superfluous to mention the other routes of medication (cutaneous, digestive, circulatory), their notorious failure is an established fact

VII ADVANTAGES OF INTRACRANIAL TREATMENT OF THE SO-CALLED PRIMARY OPTIC ATROPHIES (TABETIC AND PARETIC)

The cranial contents and optic nerves cannot be properly reached by any other route but that of the cranial subarachnoid space or the ventricles of the brain

Sharpe's and my own experiments have shown that intraventricular injections of trypan blue spread all over the cranial subarachnoid Golla, Mott[4] and Weed,[8] making cranial subarachnoid injections, have been able to follow the pigment and stain even into the perineuronic spaces Finally, I have actually seen in dogs, intravitam, the stain gradually spreading into the sheaths of the optic nerves a certain time after I injected it into the lateral ventricles

All these experiments point to one central idea, namely, that if we wish to have the *medication reach* the cerebral perineuronic spaces and the sheaths and septa of the optic nerves, we *have to introduce it right* into the cranial cavity, by way of the subarachnoid spaces or lateral ventricles For in the end the entire scope of the treatment is frustrated if the spirocheticide is not brought in immediate contact with the spirochetes, which are lodged in the perineuronic spaces of the brain in paretics and most probably *in* the sheaths of the optic nerve and between the neurons of the retina in the so-called primary optic atrophy

The slow current of the resorption taking place along the lymphatics of the sheaths of the cranial nerves, especially of the optic nerves, may be utilized with advantage for the treatment of a syphilitic process in this locality The medication, being in part slowly eliminated along the sheaths of the optic nerves, stays a longer time in contact with this nerve and is thereby given a better chance to act on the diseased tissues and their micro-organisms

Early Diagnosis—Like any other pathologic condition, syphilitic affections of the optic nerve have more chances to be attacked successfully when treatment is begun at the earliest possible moment before permanent damage is present Neurologists begin to realize that the preclinical stage of general paresis, before the degenerative process in the cortex has advanced too far, is the ideal time to begin the antisyphilitic treatment

Horsley[25] *insists that* the main thing in the treatment of syphilis of the central nervous system is early diagnosis and local treatment Collins[33] says that the only chance of success in treating general paresis is to begin it at the earliest possible moment

While this optimistic language regarding general paresis began to appear in the neurologic literature during the past few years, ophthalmologists remained as pessimistic as ever as to the outcome of primary optic atrophy (a condition so intimately allied with tabes and paresis)

Behr[34] has recently related four cases with beginning tabetic optic atrophy, progressing very rapidly to complete blindness during (in spite or because of) antisyphilitic treatment The sad progress of the tabetic and optic atrophy, no matter what is done, has paralyzed for a long time the attempts of ophthalmologists to do something for this class of patients In spite of all this, the great probability that this type of optic atrophies is due to the presence of spirochetes in the sheaths and in the interior of the optic nerves, that in the beginning these micro-organisms are localized at the periphery of the nerve mostly in its sheaths, and that only in a later stage they migrate into the nerve bundles and between the fibers, should cause us to double our efforts to recognize the earliest symptoms of optic nerve involvement and to attack the seat of lesion with the utmost vigor and in the most efficient way From this point of view every contribution toward the early diagnosis of incipient atrophy has a direct bearing on the final success in the treatment of this condition In other words, the therapeutic problem regarding the taboparetic optic nerve affections is a matter of First, how to recognize the earliest involvement of the optic nerve before the spirochetes become inaccessible, before the degeneration of the optic nerve fibers takes place Second, how best to get access to the spirochetes

The earliest diagnosis and the cranial subarachnoid route will eventually be the solution of the problem

103 East Eighty-First Street

ABSTRACT OF DISCUSSION

Dr Udo J Wile, Ann Arbor, Mich I have been impressed with three very patent facts We should have had this information before we embarked on intraspinal or other subdural therapeutic measures, we are just on the threshold of the proper treatment of *syphilis of the nervous system* and of *syphilis of the optic* apparatus The introduction of *salvarsan or salvarsanized serum* into the subdural space may be said to be the first step The second I think will surely, as the results, perhaps, of Dr Schoenberg's work, be the introduction intraventricularly, surely a *simple* operation, of some spirocheticidal substance If one had *had the* careful anatomic and physiologic data which Dr *Schoenberg* has offered us, much of the enthusiasm which followed the first efforts at any form of intraspinal *medication* would surely have been tempered On the basis of the anatomic and physiologic data furnished by Dr Schoenberg's work and the very evident fact that at *least* in the laboratory animal *staining* substances do not reach the optic nerve itself when introduced intraspinally, how can one explain the very widely different clinical reports, many of them favorable, following the introduction into the spinal canal of salvarsan or salvarsanized serum? I think the explanation may be due partly to the new conception of syphilis of the nervous system With the assistance of your chairman we have, at the University Clinic, demonstrated that in the optic nerve itself is the first clinical evidence of central nervous involvement, which takes place as early as three or four weeks after infection We have three or four cases in which the retina itself showed evidence of inflammation This is easily explainable if we assume that in the nervous system the roseola occurs as in other parts of the body It is not simply a skin manifestation It occurs in the nervous system and in 70 per cent of cases of syphilis which go on to the seventh week We must assume that as the roseola disappears from the skin it also disappears from the nervous system, and so from the optic nerve, and many of the earlier reports of beneficial results which followed the use of salvarsan intraspinally may, indeed, be due to the natural course of the disease Any degenerative processes in the nervous system cannot be benefited by any form of treatment With general paresis or optic atrophy the only possible benefit that may be derived from the introduction into the intraspinal or intraventricular space is spirochetal death and the transitory appearance of inflammatory reaction Patients with certain diseases, among which is basilar meningitis, recover, because there is no degenerative process present In general paresis the patient is not benefited and cannot be benefited

[33] Collins, Joseph The Recognition of General Paresis While It Is Still Susceptible to Treatment The Journal A M A, March 18, 1916, p 851

[34] Behr, C Klin *Monatsbl f Augenh*, 1916

Dr. James B Ayer, Boston One cannot read Dr Schoenberg's array of facts concerning the flow of cranial fluid and the necessary modifications of treatment in intracranial syphilis of the parenchymatous type without being greatly impressed by the truths expressed especially if he has like myself been relatively unsuccessful in the treatment of these conditions

In February of this year I decided that some form of intracranial lavage by salvarsanized serum was indicated but realized the difficulty of carrying out such procedure in early cases such as came to my hand So a middle course was attempted In two points craniotomy openings were made over the frontal pole and injections of serum given by the special route, followed by saline for a period of three quarters to one and one half hours under gradually increasing pressure up to 400-600 mm Subsequent puncture of the cranial subarachnoid showed the presence of the serum at this high level, not of course undiluted, but clearly recognizable. It was clear that serum could be safely forced upward "against the currents a fact noted experimentally by Weed, 1914 Four cases of optic atrophy and three of cerebral syphilis of other types are now under such treatment Two cases of advancing optic atrophy have had six such injections each over a period of three months Both show a stationary condition of vision, as tested by Dr Derby with whose cooperation I have carried on the work, and both show an amelioration of the Wassermann test a result we have hitherto been unable to accomplish Whether direct cranial injections are more efficacious I do not know but this relatively easier operation seems to offer a method well worth serious trial

Dr. Jesse S Wyler, Cincinnati The phorometric work by Carl Baer of Kiel impressed me. The connection of his work and that of Dr Schoenberg is manifest, for by this means we should be able to make a rapid and early diagnosis of optic atrophies and obtaining this diagnosis we may be able to get results which hitherto have been impossible By means of a specially constructed phorometer it was found that long before any pupillary signs or other symptoms of tabes were manifest there was a notable impairment of the light sense in the ability of the eye to adapt itself to varied degrees of light and the degrees in this perception increased as the other symptoms increased Baer concludes that in this early stage there is only a little nerve infiltration and very few spirochetes in the nerve and if the antisyphilitics reach the diseased nerve at this time results may be obtained but at later periods where there is considerable infiltration and nerve degeneration, all antisyphilitic medication will be worthless, because salvarsan causes fresh infiltration and this merely blocks out some of the fibers which were still intact The results obained were an improvement, on the average, and probably with this early means of diagnosis and Dr Schoenberg's intraventricular therapy, a new era may be for those for whom in the past the prognosis has been most unfavorable

Dr George S Derby, Boston It may not be out of place simply to try to quote what Dr Swift said in his address in Washington, that prevention is better than cure, that logically all patients with syphilis should receive spinal puncture before treatment is concluded to see whether involvement of the central nervous system has taken place, and if the examination of the spinal fluid gives a positive result, the patient should immediately be put under suitable medication

Dr Mark J Schoenberg, New York It was my good fortune to find a number of patients in the clinic who came in with optic atrophies and who had had in the department of dermatology repeated spinal injections Some of them did more or less well in the sense that those who had vision of more than $^{20}/_{100}$ kept that vision for a certain length of time They received at least twenty-five intraspinal injections, and the man who administered the injections was enthusiastic over the results My answer to this favorable report is that if we are able to maintain the vision of those who have beginning optic atrophy by injecting a chemical agent into the spinal canal, then so much the more should we obtain good results by addressing the curative agent direct to the seat of the lesion by intraventricular injections We must not forget that when we inject any agent into the spinal canal it is immediately anchored by the meninges Any of the substance which has not been anchored will go up into the cranial cavity, but how much will go we do not know, probably a small percentage It depends on the affinity between the substance injected and the meninges of the cord If some reaches the intracranial cavity, some of it will be anchored by the meninges of the brain and only a small portion of it will reach the optic nerve So that if we get some result by the intraspinal injections, we should get more by the intraventricular

I wish to protest against the term used by Dr Wyler There is no Schoenberg's intraventricular therapy It is simply suggestions from experimental work which must be done by other men over and over again before we find a great deal to recommend it for the treatment of optic atrophy

The earlier we begin our treatment the better Dr Ayer's work interested me immensely I believe there is some value in his conception, but I must repeat the argument I made before, that if we are able to do good through the intraspinal route, then we should obtain still better results by introducing the substance directly into the cranial cavity

---

Toronto and Typhoid—Toronto had a total of 151 cases of typhoid fever in 1915 It was found that sixty-nine of the total number of cases were contracted outside of Toronto, thirteen were infected by contact, one was in a worker removing night soil, one was in a sewage worker, one drank raw lake water, no infections from oysters, none from milk, and the source of infection was not traced in sixty-six There was a total of nine deaths Of the sixty-nine outside cases, five patients died, of the eighty-two inside cases, four patients died The following statitstics show how the death rate from typhoid fever has decreased since 1910 per 100,000 1910 40 8, 1911, 20 0, 1912, 12 1 1913 10 4, 1914, 7 5, and 1915 1.9 This appears to be the lowest death rate from typhoid of any city in America, Newark, N J, being 2 7, and Milwaukee, 4 6 Montreal appears high with a death rate of 22.7 Toronto has reduced its typhoid by effective chlorination of the drinking water, pasteurization of the city milk supply since 1912 except the certified milk, by education through circulars left in every house in which a case develops and by urging hospitals to employ antityphoid inoculation for their nurses and orderlies In 1910 there were 204 deaths in Toronto from typhoid noid room, but with great difficulty in the spongy spaces of the convexity of the brain and surface of the optic nerves

As we see, experimental research, physiologic considerations and anatomic arrangement of the subarachnoid spaces all argue against the efficacy of spinal medication for intracranial syphilis

A similar reasoning could be used for the discussion of the treatment of the so-called metasyphilitic optic nerve affections (tabetic and paretic optic atrophies) Antisyphilitic treatment of the so-called primary optic atrophy in tabes and paresis has invariably been a failure in the hands of ophthalmologists Mercury has been found to act injuriously on such nerves Intraspinal injections have not been a success The question may be repeated, Why does a parasyphilitic affection of the optic nerve not respond to treatment? The answer is the same as before The medication does not reach the optic nerve, or if it ever reaches it is in such a small quantity that it has a rather stimulating (?) action on the growth of the spirochetes Consequently, the spinal medication is not and cannot be efficient in the treatment of metasyphilitic or parenchymatous optic nerve affections It is rather superfluous to mention the other routes of medication (cutaneous, digestive, circulatory), their notorious failure is an established fact

VII ADVANTAGES OF INTRACRANIAL TREATMENT OF THE SO-CALLED PRIMARY OPTIC ATROPHIES (TABETIC AND PARETIC)

The cranial contents and optic nerves cannot be properly reached by any other route but that of the cranial subarachnoid space or the ventricles of the brain

Sharpe's and my own experiments have shown that intraventricular injections of trypan blue spread all over the cranial subarachnoid Golla, Mott[4] and Weed,[5] making cranial subarachnoid injections, have been able to follow the pigment and stain even into the perineuronic spaces Finally, I have actually seen in dogs, intravitam, the stain gradually spreading into the sheaths of the optic nerves a certain time after I injected it into the lateral ventricles

All these experiments point to one central idea, namely, that if we wish to have the medication reach the cerebral perineuronic spaces and the sheaths and septa of the optic nerves, we have to introduce it right into the cranial cavity, by way of the subarachnoid spaces or lateral ventricles For in the end the entire scope of the treatment is frustrated if the spirocheticide is not brought in immediate contact with the spirochetes, which are lodged in the perineuronic spaces of the brain in paretics and most probably in the sheaths of the optic nerve and between the neurons of the retina in the so-called primary optic atrophy

The slow current of the resorption taking place along the lymphatics of the sheaths of the cranial nerves, especially of the optic nerves, may be utilized with advantage for the treatment of a syphilitic process in this locality The medication, being in part slowly eliminated along the sheaths of the optic nerves, stays a longer time in contact with this nerve and is thereby given a better chance to act on the diseased tissues and their micro-organisms

Early Diagnosis—Like any other pathologic condition, syphilitic affections of the optic nerve have more chances to be attacked successfully when treatment is begun at the earliest possible moment before permanent damage is present Neurologists begin to realize that the preclinical stage of general paresis, before the degenerative process in the cortex has advanced too far, is the ideal time to begin the antisyphilitic treatment

Horsley[26] insists that the main thing in the treatment of syphilis of the central nervous system is early diagnosis and local treatment Collins[33] says that the only chance of success in treating general paresis is to begin it at the earliest possible moment

While this optimistic language regarding general paresis began to appear in the neurologic literature during the past few years, ophthalmologists remained as pessimistic as ever as to the outcome of primary optic atrophy (a condition so intimately allied with tabes and paresis)

[33] Collins Joseph The Recognition of General Paresis While It Is Still Susceptible to Treatment The Journal A M A, March 18, 1916, p 851

[34] Behr, C Klin Monatsbl f Augenh, 1916

Temperature Record February 3 4 a m 98 6 4 p m 98, 8 p m 98 6 midnight 100 February 4 4 a m, 99 2, 8 a m, 99, 4 p m 100 6, 8 p m 100 6, midnight 100 February 5, 4 a m 99 8 a m 98 8, noon, 98 6

Following this injection the patient complained of severe pain in the legs, it was necessary to give a sedative before the patient could sleep Cell count at the time of injection revealed 21 lymphocytes per cubic millimeter, eight hours after injection 1 280 cells 94 per cent polymorphonuclears, 6 per cent lymphocytes

Case 2.—The diagnosis was general paresis Examination of the spinal fluid revealed 16 lymphocytes per cubic millimeter The Wassermann reaction was 4 plus The Nonne reaction was plus In the Lange test the first five tubes were affected

First Injection—Jan 22, 1916 at 11 a m, 0 01 grain of mercuric succinimid in 20 c c of spinal fluid was injected

Temperature Record January 22 4 p m 98 8 p m, 100 6, midnight, 101 January 23 4 a m 101.2 8 a m 100 8 4 p m., 101 2 January 24 4 a m, 99, noon 101 6, 4 p m 101.2, 8 p m, 99 6 January 25, 4 a m, 99 8 noon 99 2 January 26 4 a m 99 8

The cerebrospinal fluid twenty-four hours following the injection of mercury showed 1,200 cells per cubic millimeter, 44 per cent lymphocytes 56 per cent polymorphonuclears During the first twenty-four hours there were insomnia and restlessness

Second Injection—Feb 10 1916, at 9 p m, 0 01 grain of mercuric chlorid in 20 c.c of spinal fluid was injected Cell count revealed 6 lymphocytes The Nonne reaction was plus

Temperature Record February 10 4 a m 98 noon, 98 4 February 11 4 a m 99 4 8 a m 100.2 noon 101 4, 4 p m 102.2 8 p m 101 4 midnight 99.2 February 12 4 a m 100, 8 a m., 99 6, 4 p m., 101 4 8 p m, 99 6 February 13, 4 a m. 99 8 noon 99 4 8 p m, 99 4

Following the injection the patient did not complain of any pain There were insomnia and restlessness on the night following the injection

Case 3—The diagnosis was tabes dorsalis

First Injection—Feb 23 1916 at 8 30 p m 0 02 grain of mercuric succinimid in 20 c.c of spinal fluid was injected

Temperature Record February 23 4 a m., 98, noon 98, midnight 100.2 February 24 4 a m 100 4, 8 a m 100 6 noon 102 8, 4 p m 101 8 February 25 4 a m 100 6 8 a m 100 4 p m 100 4, 8 p m 100 4 midnight 98 February 26 4 a m 98 8 a m., 98 6 noon 98 6 4 p m 98 6 8 p m 98

Following the injection the patient had severe pains during the night lancinating in character These continued the following day The patient also had a drawing and aching sensation in the thighs and vomited once in the early morning February 25 the patient still had pain in the legs and thighs but no nausea. February 26 the patient was quite comfortable. The spinal fluid findings at the time of the injection revealed 90 lymphocytes, the Nonne reaction was plus, the Wassermann 4 plus Forty-four hours following injection the fluid had a slight yellowish tint Cell count revealed 446 cells (72 per cent polymorphonuclears)

In fifteen cases treated in the same manner similar symptoms were noted

Pain was rather severe, localized in the back and extending down the limbs in all of the cases

There was retention of the urine in two cases which lasted for twenty-four hours, requiring catheterization The patients had no trouble after the first twenty-four hours

There were insomnia and restlessness in four cases

There were headache and pain extending down the back in ten cases

A rise in temperature ranging from 99 to 103 F was noted during the first twenty-four hours in all the cases The temperature began to rise about four or five hours earlier following the injections of the mercuric chlorid and succinimid than following the injections of mercurialized serum

Nausea and vomiting occurred in three cases during the first twenty-four hours

The cell count in the spinal fluid during the first twenty-four hours following injection ranged from 300 to 2,000 cells per cubic millimeter During this period the polymorphonuclear leukocytes predominated with a gradual return to a lymphocytosis later The period of increased cell count lasted on an average about seventy-two hours

Urticaria was present in two cases following the injection of mercurialized serum The patients, as a rule, did not complain of so much pain following the injection of the serum when administered for the first time, but seemed to show a stronger reaction with each succeeding injection, while with the salts of mercury the reaction did not appear quite so strong with each succeeding injection Some of the patients expressed a feeling of improvement a week or two after the injection, and requested further treatment No statement can be made at this time as to the ultimate results following these injections However, if Lange's observations on reactions obtained from the spinal fluid, even when the blood showed negative findings, were accurate, it seems in order to employ some form of intraspinal treatment In administering the mercuric chlorid we would recommend doses of 1/100 grain when using the spinal fluid as the vehicle This can be made up in a 1 per cent solution so that 1 minim represents the dose This should be thoroughly mixed with the spinal fluid before reinjecting We would not advise using less than 20 c c of the spinal fluid as a vehicle for this amount of mercury The technic which we have employed has been described in a previous article

THE FREQUENCY OF UNSUSPECTED SYPHILIS

WITH SPECIAL REFERENCE TO ITS INCIDENCE IN SO-CALLED NEURASTHENIA *

JAMES S McLESTER, M D
BIRMINGHAM, ALA.

The routine use of the Wassermann reaction has brought about some interesting revelations, and, applied to large numbers of hospital patients, shows the surprising prevalence of syphilis In private practice, however, observations are made on patients representing a different social level, and should offer light on this social disease from another angle

The Wassermann reaction has been used in my private work in a routine manner, without regard to history or complaint, and I wish to report on 300 consecutive patients It is only fair to state that practically all of these patients were seen in consultation or were referred by other physicians, and thus presented more or less difficult or obscure disease conditions I assume, therefore, without entering on a discussion of the value of the Wassermann test, that the number of positive Wassermanns here reported gives a fair indication of the role played by syphilis in the more obscure syndrome of internal medicine

The tests were done by Miss Blanche Frazier, who has had abundant experience, including several months' training with Professor Zinsser, and whose results are to be relied on The half Wassermann was employed, using an antisheep hemolytic system, two units of amboceptor, and straight alcoholic extracts of both human and beef heart as antigens

---

* Read at the meeting of the American Society for Clinical Investigation Washington D C May 8 1916

* Case reports will appear in the reprints a copy of which can be had on application to the author

Of the 300 patients, fifty-six, or 18.8 per cent., gave a positive Wassermann reaction In reviewing this series, one is tempted to paraphrase the familiar statement that hysteria can simulate any disease complex by saying that syphilis can produce any disease complex

Of the fifty-six positive cases, twenty-two, or 39 per cent., gave a history more or less complete of syphilis, while thirty-four, or 61 per cent., gave no such history, either direct or suggestive

The most important group — the subject of this report — was formed by the neurasthenics There were thirty-two patients who, according to current usage, must be given the diagnosis of neurasthenia I use the word "neurasthenia" for want of a better, in the general rather than the restricted sense, to indicate that indefinite group of emotionally unbalanced individuals who, given to introspection, come to the physician — in time to many physicians — with the greatest variety of complaints, none of which seem to rest on a demonstrable physical basis Asthenia, bodily or mental, is not necessarily a prominent symptom, for many of these patients are vigorous and are of good judgment except where their own physical well-being is concerned In a stricter sense, perhaps, some should be called hypochondriacs In ordinary clinical experience, however, all patients with such functional neuroses are classed together as neurasthenics

Of this group of thirty-two, fifteen, or approximately 50 per cent., gave a positive Wassermann reaction Beyond this finding, none of these patients gave other evidence of disease Three patients with apparent neurasthenia, each with a positive Wassermann reaction, of whom two have myocardial troubles and one arthritis, are not included Other instances of neurasthenia with a positive Wassermann reaction have been observed in medical wards of the Hillman Hospital, but cannot fairly be included in this group of private patients

Of the fifteen neurasthenics with a positive Wassermann reaction, only two gave a history of syphilis

Slight myocardial incompetency and early tuberculosis have been given prominence as causes of neurasthenia, while syphilis in this connection has received but scant attention Textbooks mention it casually, and I know of but one author who ascribes to syphilis anything like a leading rôle in the causation of functional nervous troubles

It is unfortunate that the cerebrospinal fluid of only five of these patients was examined One of these gave a positive Wassermann (four plus), cell count of ten, Ross-Jones three plus, Pandy two plus, and Lange's colloidal gold reaction showed a characteristic paretic c[illegible] [illegible] Another gave a four plus Wassermann, while [illegible] three patients were negative to all of these tes[illegible] spinal [illegible] such circ[illegible]

THE QUESTION OF PARESIS

The ques[illegible] [illegible] naturally arises, Are not some of these patients earl[illegible] It is of course, impossible to answer with absolute certainty, since general paresis in the very beginning may present a "neurasthenoid stage," and such patients have the appearance of typical neurasthenia I can only say that the mental and other symptoms by which we usually recognize general paresis were in these cases missing The pupillary abnormalities, the characteristic mental and moral changes, the tremors, and the speech, trophic and sensory disturbances were all absent The typical paretic's symptoms are elicited with some effort, while the neurasthenic forces on us a recital, frequently a long one, of his troubles The one is indifferent to his disabilities, while the other is acutely conscious of them Measured by such clinical standards, none of these patients are paretics

How then are we to regard these so-called neurasthenics who give evidence of syphilis? Is the cerebrospinal nervous system under the influence, directly or indirectly, of some syphilitic toxin — a sort of focal infection? Is this a mild, an essentially chronic form of cerebrospinal syphilis? Or, are these patients, after all, paretics of a peculiar type? Perhaps both of the last two questions may at times be answered in the affirmative Certainly, all such patients with a positive Wassermann reaction are potential paretics

CONCLUSIONS

From a study of these 300 patients, two conclusions seem warranted first, that syphilis is a vastly more important factor in internal medicine than is commonly thought and, secondly, that a large number of so-called neurasthenics are infected with syphilis and possibly present a mild form of cerebrospinal syphilis

---

VACCINE THERAPY AND OTHER TREATMENT IN ACNE VULGARIS AND FURUNCULOSIS

HAROLD H FOX, M.D.
ITHACA, N Y

As a result of observations made in the medical advisers' office at Cornell University, the writer's attention was attracted to the great prevalence of acne vulgaris and furunculosis among young men A study of the examination records of the entering students showed that 30.2 per cent. of the freshmen class suffered from acne vulgaris Of this proportion, the distribution of the lesions in 17.8 per cent. was general and in 12.2 per cent. of the cases it was limited to the facial region

In order to ascertain just what results could be expected from the different forms of therapeusis, and more especially to try out the efficacy of vaccine therapy in the treatment of acne vulgaris and of furunculosis, an analysis of 100 unselected cases of these two forms of pyogenic dermatoses was undertaken

The cases were all considered chronic, in that they were all of six months' or more duration, and no case was included in which the eruption could possibly be ascribed to drugs, to occupation, or to syphilis No attempt was made to study the bacterial etiology of either condition, except in so far as was necessary for the preparation of the autogenous vaccines, since that has been so well worked out by previous investigations, and also because ordinarily the stock vaccines are prescribed on the basis of a clinical diagnosis

Previous consultations had shown that a large number of the patients ascribed their condition to dietetic errors, the most common of which was the ingestion to excess of sugar, candies, pastries, or to digestive disturbances, such as constipation Consequently, all the patients studied were instructed before beginning treatment to avoid such foods as seemed to disagree with them, not to eat to excess, to eat slowly and at regular intervals, to drink plenty of water, especially on rising in the morning, to see that the organs of elimination were functioning normally, or if they were not, to consult the physician in charge before resorting to medical correctives Locally, they were to remove the comedones by gentle massage, after first having relaxed the skin by applications of towels wrung out in hot water Following the removal of the blackheads, they were advised to apply to the face towels wrung out in cold water, in order to tone up the skin and cause a diminution in the size of the pores Generally speaking, the directions were fairly well carried out

For purposes of classification and study it was deemed advisable to group the cases in three tables Table 1 shows the number of cases each of acne vulgaris and of furunculosis treated, their distribution, duration and certain apparent contributory factors in their etiology, and finally the form of treatment used, with the total number receiving such treatment

Table 2 gives in detail the course and results attained by vaccine therapy, and the average number of days between treatments The average number of treatments per case, and the total number of cases treated Previous observations had led us to believe that the fine type of acne vulgaris responded less favorably to vaccines than the coarse variety, so in Table 2 the acne cases were divided into a coarse and fine type, and these two classifications were again subdivided into, first, those in which the majority of the lesions were pustular, second, those in which the majority of the lesions were papular, and third, those in which the pustular and papular elements were present in about equal proportions Furuncles were not classified under subheadings

TABLE 1—NUMBER OF CASES OF ACNE VULGARIS AND OF FURUNCULOSIS THEIR DISTRIBUTION DURATION ETIOLOGY AND TREATMENT

Disease	Number of Cases	Facial	General	Average Duration Years	Season When Worse		Sporadic	Comedones Marked	Athletics	Dietetic Errors	Digestive Disturbances	Therapeutic Measures			
					Winter	Summer						Vaccines	Local	Combined	Medical
Acne vulgaris	74	51	23	3 to 4	16	28	30	15	0	15	10	53	15	3	3
Furunculosis	26	4	22	6¼ to 1	3	8	15	4	9	7	4	9	7	7	8

TABLE 2.—DETAILS OF TREATMENT BY VACCINE THERAPY IN CASES OF ACNE VULGARIS AND FURUNCULOSIS

Disease	Number of Cases		Average Number of Treatments per Case		Average Number of Days Between Treatments		Results Noted During Treatment			Results Noted Three Months After Cessation of Treatment				Percentage Improved After Three Months		Percentage Cured After Three Months	
	Autog	Stock	Autog	Stock	Autog	Stock	Improved	No change	Worse	Improved	No change	Worse	Cured	Autog	Stock	Autog	Stock
Acne vulgaris coarse																	
Majority of lesions pustular	1	8	8	4	3	4.2	4	5	0	1	7	0	1	100	12.5	0	12.5
Majority of lesions papular		9		3.2		2.6	4	5	0	4	5	0	0		44+		0

Acne vulgaris fine																	
Majority of lesions pustular		8		4		3	0	3	0	0	3	0	0		0		0
Majority of lesions papular		7		5+		3.9	3	4	0	1	6	0	0		14+		0
Papular and pustular lesions evenly divided	1	7	12	3.5	3	2.72	3	5	0	0	8	0	0	0	0	0	0
Totals	4	49	8	4.1+	3.38	3.3+	23	20	0	9	43	0	1	25	18+	0	2+
Furunculosis	2	7	10	4	4	3	4	3	0	0	4	0	3	0	0	0	42+

Table 3 gives in percentages the results attained by the different forms of treatment three months or more after cessation of all treatment

Further consideration of Table 1 exhibits, as perhaps its most striking datum and one not generally brought out by writers on the subject, the fact that in the seventy-four cases of acne treated not one of the cases developed in a student engaged in athletics The writer does not mean to imply that acne has never occurred in athletes, but he wishes to point out that the table shows the great part athletics plays in the prevention of acne This may be explained on Stein's[1] theory, that acne is caused in part by certain disturbances of the sexual functions, which in turn cause hyperactivity of the sebaceous glands, so that athletics, by furnishing a normal outlet for the superabundant energy, diminishes the production of sebum, and so prevents or cures acne I am rather inclined, however, to accept the general view that the beneficial effect of athletics upon acne is due, not to the athlete's strenuous muscular exertion itself, but rather to the more regular habits and the strict personal hygiene required of the student representing his college in any form of athletics On the other hand, however, it will be noted that nine cases of furunculosis, out of a total of twenty-six, occurred among students engaged in athletics These cases, I believe, were due to direct infection, and without exception, occurred among the wrestlers and crew men, the location of the lesion being typical of the cause of the trouble, so to speak, among crew men, the lesions were on the buttocks, due to minute abrasions caused by sliding on the rowing seats, and consequent enforced entry of pyogenic bacteria In wrestlers the lesions were of like nature, usually on the arms, neck and legs, the parts most frequently exposed to trauma Dietetic errors and digestive disturbances accounted for from one third to one half the cases in each group Comedones were not found so frequently as many writers would lead us to expect A majority of the cases in each group were sporadic, but of those influenced by seasonal variation, the larger number of cases occurred in the summer The cases of acne showed longer average duration than the cases of furunculosis, the period of duration being from three to four years for acne, for furunculosis six months to one year It is interesting to note that although of the entire freshmen class the larger percentage of the cases of acne were of general distribution, over twice the number of students who applied for treatment did so for the facial type of acne

---

[1] Stein R O Med Klin, Jan 23 1915 p 85

Under the heading local treatment were included all applications made directly to the eruptions In some instances this meant ointments or lotions, in others, particularly the coarse pustular type, and especially in furunculosis, local treatment includes evacuating the pus by free incisions, and applications of wet dressings Combined treatment includes those cases in which the patient received the vaccines in conjunction with the local treatment Medical treatment includes cases in which the patient was treated only by medicines taken internally, such as calcium sulphid and cod liver oil

TABLE 3—CONDITION OF PATIENT THREE MONTHS OR MORE AFTER CESSATION OF TREATMENT

Disease	Results of Local Treatment, Percentages				Results of Combined Treatment, Percentages				Results of Vaccine Treatment, Percentages				Results of Internal Medical Treatment, Percentages			
	Improved	Cured	No change	Worse	Improved	Cured	No change	Worse	Improved	Cured	No change	Worse	Improved	Cured	No change	Worse
Acne vulgaris	60	6+	33	0	100	0	0	0	17+	1+	81+	0	66+	0	33+	0
Furunculosis	14+	85+	0	0	14+	85+	0	0	0	33+	66+	0	66+	33+	0	0

A study of Table 2, or those cases in which the patients were treated by vaccines, shows that not one patient with acne seen three months or more after cessation of treatment was cured by autogenous vaccine, on the other hand, autogenous vaccines were credited with causing permanent improvement in 25 per cent, and stock vaccine in 18 per cent of the cases The coarse type of acne comprised cases in which the diameter of the majority of the lesions exceeded a pin head in size, 22 8 per cent of these patients were permanently improved, 2 8 per cent cured The fine type, or those in which the majority of the lesions were pin head or less in diameter, exhibited but 5 5 per cent of the patients improved, none cured

A closer study of Table 2 will show what may be the explanation of the reason certain physicians so enthusiastically recommend vaccine therapy in acne and allied conditions, namely, that improvement is much more frequently noted during treatment than on examination of the patient at a much later date In this series twenty-three out of fifty-three patients exhibited improvement during treatment, but three months after the treatment was discontinued only nine showed any change for the better The average number of days between treatments and the average number of treatments per patient were respectively, for autogenous vaccines 3 38 days, and eight treatments, for stock, 3 3 days, 4 1 treatments, the period between treatments being governed by the reaction We always waited, as advised by the manufacturers of the vaccines, until the severity of the reaction, if any reaction occurred, passed away, before giving a second dose[2] In general, the directions given by the manufacturers for the dosage and administration of the vaccine were sedulously followed

Dennie and Bufford[3] state that "autogenous vaccines were superior to stock, excepting in the treatment of furunculosis, in which no difference could be seen" As may be seen by comparing the percentage totals of the cases of acne and of furunculosis, as shown in Table 2, our results do not coincide with the latter portion of their statement In our series none was improved or cured by autogenous vaccines Of all the patients treated, in no instance did the eruption appear to be rendered worse by any form of treatment used However, two patients who received the autogenous vaccine for acne developed such alarming symptoms, following the first injection, high fever, headache, nausea, dizziness, and very severe local symptoms, that the treatment was discontinued Wallace,[4] Hitchins,[5] and others have reported cases manifesting untoward symptoms of like nature following the injections of bacterial vaccines, the reaction probably being of an anaphylactic nature, and the possibility of such an occurrence should be borne in mind

A comparison of the results expressed in percentages, as shown in Table 3, indicates that under the heading furunculosis there was no difference to be noted in the results of the local treatment and of the combined treatment In each instance 14 per cent of the patients were improved and 85 per cent cured, leaving one the deduction that probably in the group of patients receiving combined treatment most, if not all those who responded favorably did so to the local treatment received

The acne patients gave somewhat different results, every one was improved, but none cured, by the combined treatment Local treatment, improved 60 per cent, cured 6 per cent and produced no change in 33 per cent In the group treated by vaccines alone, stock and autogenous, 17 per cent of the acne patients were improved, only 1 per cent cured and 81 per cent showed no change As might be expected, furunculosis showed much better results following combined treatment, 33 per cent being cured Internal medical treatment did not give the results hoped for Calcium sulphid is not, as has been claimed, a specific for acne or furunculosis I believe that the favorable results classified as due to internal medicine could not be ascribed to any direct action of the medicine itself, but rather to the improvement of the physical condition of anemic patients by the use of such medicines as cod liver oil, iron, arsenic, strychnin, bitter tonics, etc , by stimulating the excretory organs, by regulating the habits, and by improving the personal hygiene

CONCLUSIONS

Our investigation would seem to demonstrate, first the important part played by personal hygiene in the cause, prevention, and treatment of acne vulgaris and furunculosis, second, the superiority of well-known therapeutic measures over vaccine therapy in the conditions studied, and third, the value of following up the cases to ascertain the number of permanent improvements, since experience has shown that the results attained during the time of treatment are no criteria of the changes to be seen in the eruption at a later date

As T J Horder[6] has well said "The failures of vaccine therapy are probably more numerous than its successes "

A CASE OF GRANULOMA PYOGENICUM AFFECTING THE EYELID[*]

CASSIUS D WESCOTT, M D

CHICAGO

May 16, 1914, Harold B , aged 9 years, was referred to me by Dr George W Webster of Chicago, because of a tumor of the eyelid The history, obtained from Dr Webster and the boy s guardian, was of a small tumor, apparently a sebaceous cyst, which was first noticed eight or ten weeks before, just above the cilia of the upper lid of the left eye About two weeks before his visit to me the appearance had suddenly changed to that of a blood blister, which in a few days was so prominent that a silk thread was tied around it with the idea of strangulating and removing it Instead of drying and dropping off, as had been expected, the tumor evidently became infected, grew larger and bled easily when it was touched

On examination, I found a teat-shaped mass of dark red color projecting from above the lid edge, apparently coming through the skin rather than growing from it, being surrounded by normal integument, as with a collar The boy's guardian was extremely anxious about his condition, as his father had recently died of carcinoma of the face I had never seen such a tumor, and suggested that Dr W A Pusey, professor of dermatology in the University of Illinois, College of Medicine, be consulted He at once made the diagnosis of granuloma pyogenicum, and a slide which I had made from a bit of the tip of the tumor confirmed the diagnosis The following is from Dr Pusey's report to me after seeing the patient

'Granuloma pyogenicum, of which this case is a type, is a condition which pathologically is very simple, but clinically is extremely confusing The lesions first show as a minute bright red to dark red tumor This grows rapidly until it reaches the size of a half pea or hazelnut, or larger, and then remains stationary or, it may be, shrinks slightly and becomes denser A developed lesion may be a prominent sessile tumor, popping up through a thick horny collar, or a flattened dome-shaped red mass of the diameter of a pea or hazelnut kernel with a similar collar The early lesions are usually denuded of horny epidermis, bright red, soft, and bleed easily, the older lesions have a thin translucent layer of horny epidermis over them, and so are less intensely colored, are fairly firm to the feel and do not bleed unless wounded In my experience, they are usually not painful or tender They occur on the face and hands by preference As they persist for weeks or months and stubbornly return if not completely destroyed, they are very apt to be a source of perplexity, if not anxiety

"The two conditions which they simulate are malignant tumors and chancres On the face they arouse fears of malignancy, and I recall one flattened round lesion on the finger of a dentist which I was able to differentiate from a chancre only by the most careful study As the lesions are not infrequent, their recognition is a matter of considerable practical importance The lesions are in the beginning masses of highly vascular granulations produced by infection with staphylococci of slight virulence Later they become a mass of well organized connective tissue riddled with blood vessels The most striking and characteristic feature is the great number of new blood vessels, which may be so numerous as to suggest an angioma

'Simple as the lesions are, they have been the source of no end of clinical, pathologic and bacteriologic confusion The cases were first described in 1897 by Poncet and Dor as botryomycosis hominis By 1902 Bodin and others had demonstrated that the organisms producing the lesions were not botryomyces but staphylococci And in 1904 Hartzell clearly established the true character of the lesions and suggested the name granuloma pyogenicum "

May 28, under ether anesthesia, I removed the tumor by a clean incision with curved scissors, down to the tarsus, curetted the base and skin edges and cauterized the wound with solid silver nitrate The eye was dressed with White's ointment, and the wound healed without infection and with a very small scar

The patient reported Sept 13, 1914, and there had been no recurrence, and the cilia were only slightly disturbed I have recently seen him again, and there is still no recurrence

In 1906, Dr Pusey[1] published an excellent paper on vegetating dermatoses in which reference is made to granuloma pyogenicum In 1910, Wile[2] published an elaborate article on granuloma pyogenicum with complete bibliography

22 East Washington Street

ABSTRACT OF DISCUSSION

Dr Lee M Francis, Buffalo As Dr Wescott suggests, granuloma pyogenicum had had a clinical identity only since 1897 As far as I am able to gather, this is the first case involving the eyelids to be reported, although it is not clear why the growth should not have been more frequently observed in this area The lids, frequently exposed to abrasion and infection from meddling fingers, with a very thin and loosely attached integument, offer a favorable site of low resisting power to bacterial invasion As stated, the causal factor is probably a staphylococcus of low virulence implanted in an unfavorable soil The lesions develop most frequently on the fingers, feet and face, although no part of the body is immune Sutton (The Journal, May 20, 1916, p 1613) has reported three cases occurring on the lips Wile (*Jour Cutan Dis*, December, 1910) has pointed out that granuloma pyogenicum presents a uniform histologic appearance, essentially that of circumscribed granulation tissue, rich in thin walled blood vessels with mononuclear and polynuclear infiltration According to Wile the condition also presents certain rather constant clinical aspects which serve to identify it namely, a pedicle, tendency to hemorrhage when touched rapid growth and proneness to recurrence, if not thoroughly ablated and its base carefully cauterized To this should be added the previous history of injury It must not be forgotten that the latter may be very minute, as for example, an insect bite Stellwagon has commented on the resemblance between granuloma pyogenicum and the raspberry or strawberry-like growth sometimes following vaccination (usually unsuccessful) As Dr Wescott has said, granuloma pyogenicum might be confused with the initial lesion of syphilis and malignant growth The lack of induration and of regional lymph involvement differentiates it from the former, while the patient's age, slower growth, and absence of a precancerous stage, such as hyperkeratotic patches, would differentiate it from the latter The final analysis must be left to the pathologist and bacteriologist

[*] Read before the Section on Ophthalmology at the Sixty Seventh Annual Session of the American Medical Association Detroit June 1916

[1] Pusey W A Jour Cutan Dis December 1906

[2] Wile Jour Cutan Dis December 1910

Dr. Udo J Wile, Ann Arbor, Mich The cases I described were three It seemed a subject of more than unusual interest. The diagnosis of sarcoma has so frequently been made in cases of pyogenic granuloma that many persons have suffered the loss of a finger, hand or arm when sarcoma was suspected Before I began the histologic study of this type of tumor it was known that the staphylococcus was the basis of it, but we did not know why it should produce a fungating type of lesion with a granulomatous base If the explanation I have offered is correct, it would seem that the injury—the site of the injury—is a most important factor in the development of the tumor The staphylococci are implanted in the intima of the blood vessels We have an actual blood-vascular tumor This explains why simple ablation does not result in a cure If ablated level with the surface or even below it, the tumors usually return with an increase in their growth If, however, the offending blood vessel focus of infection is cauterized, they are permanently cured

Dr John E Weeks, New York In this connection I wish to inquire whether the so-called granuloma of the cornea or of the sclerocorneal margin is not akin to this granuloma that has been described as affecting the skin of the lids and the skin of various parts of the body All who have dealt with granuloma of the cornea know that there is a marked tendency to recur Some years ago I had opportunity to examine microscopically and bacteriologically two cases of sclerocorneal tumor In one case operation had been performed twice, recurrence had taken place, and the eye was enucleated on the third recurrence On examining that eye I found masses of staphylococci in the blood vessels and in the tissues at the base of the tumor The tumor did not transcend into the true tissues of the cornea, and it occurred to me that the exciting cause of the tumor was the micro-organism So in the next case that presented itself to me I excised deeply and cauterized the surface of the granuloma and succeeded in preventing a subsequent recurrence On examining that tumor I found the same condition It was a puzzle to me The description of this growth beginning in the lid or in the skin makes it apparent to me that in all probability the so-called granuloma occurring on the cornea and limbus is of the same nature

Dr. Harold Gifford, Omaha I saw one case of this affection a number of years ago which took a somewhat unusual course, in that the lid perforated entirely This fungoid mass perforated first the outside and then the inner side and left quite a large hole through the center of the left upper lid This was in a young woman who had a peculiar skin eruption which suggested secondary syphilis, and she came from a region just having smallpox We never could tell just what she had Whether it had any connection with the main cause I do not know At that time we did not know about granuloma pyogenicum I indexed this as a case of botryomycosis, which was the name under which it went at first The patient made a perfect recovery We simply cut out the hole and sewed up the lid Since reading of Dr Wescott's case it has occurred to me that any one reading this description might take cases of sporotrichosis for pyogenic granuloma, because in sporotrichosis there is sometimes a fungating mass covered with a coating of thin skin, and the description sounds quite similar The course would probably be different, and so far as I know the staphylococcus has not been noticed, but I think it might be well to keep this possible mistake in mind

Dr Edward Jackson, Denver I should like to mention a case which has taken a new significance for me from Dr Weeks' remarks—a case I saw two months ago, in which the structure is clearly that of granuloma, but which was not stained and examined for the presence of micro-organisms It was at the margin of the cornea Two things which I have never seen before struck me in the clinical appearance of this little swelling One was the markedly purplish red surface, and the other an edge that reminded me of the edge of an epithelioma but was perfectly soft, consisting of almost normal conjunctiva, an appearance recalled by the collar around the neck of the granuloma as spoken of The structure, as far as histologic examination could determine, was clearly similar to the class of tumors under discussion The history of this, of about six or eight weeks' standing, would place it as a comparatively early tumor of the sort

Dr C D Wescott, Chicago I have seen only one or two cases of sporotrichosis, and these I could easily differentiate after seeing this case and reading the description of the other cases The rising of the tumor through a collar of skin is characteristic, and is described by every one who has seen the tumor

Transfusion of Blood—(Concluded)

INDICATIONS

As technic improves and experience increases in transfusions, more and more indications for its use are being found It is no longer used only as a last resort for life-saving purposes It is finding its field of usefulness extended to diseases in which an influx of some new blood might hasten the progress toward improvement or diseases in which it will tide the patient over a temporary relapse In reviewing the results of 212 blood transfusions in 189 cases, Ottenberg and Libman[10] mention a large number of varied conditions in which transfusion was tried They also discuss the results obtained in each condition Their classification is as follows

I Transfusions for simple hemorrhage.
    1 Gastric and duodenal ulcer
    2 Dysentery
    3 Typhoid hemorrhage
    4 Ectopic pregnancy
II Transfusions in connection with surgical operations
    1 Preliminary to operation
    2 For postoperative hemorrhage
    3 For shock
III Transfusions for the cure of hemorrhagic conditions
    1 Purpura hemorrhagica
    2 Hemophilia
    3 Hemorrhages secondary to
        (*a*) Blood diseases
        (*b*) Severe infections
        (*c*) Jaundice (cholemia)
IV Transfusions for blood diseases
    1 Pernicious anemia
    2 Leukemia
V Transfusions for infections
    1 Infections with pyogenic organisms
    2 Subacute streptococcus endocarditis
VI Transfusions for intoxications
    1 Acute poisoning
    2 Diabetic coma
VII Transfusions for debilitated conditions
    1 Cancer
    2 Malnutrition
    3 Simple anemia

---

[10] Ottenberg and Libman Am Jour Med Sc, 1915 cl 36

The experience of Ottenberg and Libman in the foregoing cases was as follows

In duodenal or gastric ulcer the hemorrhage was stopped in twelve of fourteen cases in which the conditions were desperate The cases best adapted are those in which there has been repeated or prolonged bleeding In acutely bleeding cases there is danger of increasing the hemorrhage through increase in blood pressure

The dysentery cases were not so successful as to their final outcome In four of six cases transfused, the patients died from a continuation of the dysentery

In typhoid fever, in which nine transfusions had been performed in seven cases, two of the patients ultimately recovered They state that "in all typhoid cases, the first appearance of blood in the stools should be an indication to make preparations so that transfusion can be done, if needed, at very short notice"

In bleeding in ectopic pregnancy, transfusion was life-saving in all of three cases transfused

In transfusions done in connection with surgical operations, in thirty-three preoperative transfusions, thirteen patients recovered from the operation Some of the others died from postoperative complications They had three brilliant recoveries in five transfusions for postoperative hemorrhage In shock, however, transfusion was disappointing

With the hemorrhagic conditions, in nine cases of purpura hemorrhagica, six patients recovered completely In hemophilia, in five out of six cases the hemorrhage ceased and the patients regained good health In hemorrhage secondary to infection, in one, a case of a new-born, the hemorrhages were checked In another with gonorrheal rheumatism, transfusion was followed by recovery, while in a third case of hemorrhagic diphtheria, the patient died

In three cases of acute leukemia, the hemorrhages did not cease after transfusion, whereas in one chronic case it did

Transfusions for hemorrhage in jaundice have been very disappointing, the hemorrhage persisting afterward, even in the nonmalignant cases

The experience of Ottenberg and Libman with transfusions in pernicious anemia consisted of thirty-five transfusions in twenty-five cases In no case was there a cure, in eleven cases no effect was observed, whereas in fourteen cases immediately following the transfusion, there were more or less prolonged remissions They quote one case in which splenectomy was also done after the third transfusion, with a brilliant result, the patient returning to excellent health In their summary they state that although transfusion never cures pernicious anemia, nevertheless it is the best remedy, for it leads to remissions in about half the cases

In leukemia, the transfusion was performed in ten cases In the acute cases, the patients did not fare well, whereas in the chronic cases of the lymphatic type there was a tendency for the blood picture to return to normal This, however, was only temporary, as the leukemic blood picture ultimately returned

Transfusions were also done in infectious diseases It was done only as a last resort in some of the very desperate cases There were ten cases, and four of these patients recovered Three of these successful cases were osteomyelitic infections due to *Staphylococcus aureus* The fourth case was a streptococcic infection

In endocarditis, transfusing was resorted to to combat the anemia There were four cases, all due to the *Streptococcus viridans* In three of these cases there was temporary improvement, but all four patients succumbed to the disease

Transfusion is of value in cases of poisoning due to carbon monoxid, hydrocyanic acid, benzene or nitrobenzene when the blood has been acted on by these to a marked degree Preliminary phlebotomy, however, is very essential

Diabetic coma offers a poor field for transfusion In four cases in which transfusion was performed, not one patient recovered

In debilitated conditions caused by cancer, transfusion without surgical interference is of no avail On the other hand, it may relieve the anemia in tuberculosis In the simple anemias due to malnutrition or other minor causes, transfusion is justified, and satisfactory results can be obtained

In a series of fifteen cases of hemorrhagic disease of the new-born, Lespinasse[11] transfused by the direct method, and obtained recoveries in thirteen

In 1911, Cole[12] transfused twenty cases of pellagra, with recoveries in 60 per cent This is in marked contrast with from 10 to 20 per cent recoveries obtained by other therapeutic means

Bernheim[13] performed transfusion in a case of pemphigus and one of psoriasis, both, however, intractable to other measures There was temporary relief in both, but no permanent relief He also suggests the possibility of its use in temporarily anemic cases, in cases of chronic infection with consequent debility, or in cases of lowered resistance in which an infusion of good red blood would seem to be the only thing needed

Lewisohn,[14] in children, using the citrate method described by him, obtained excellent results in four hemorrhagic cases, one case with extensive burns, and in two cases with severe anemia

In a review of the most recent literature on the subject of transfusions, several facts stand out very impressively These are the ease and safety of transfusions, the large number of varied conditions that are either cured or much improved by transfusion, and the large field of usefulness that lies open to those who are doing transfusion work

Brewers Forbid Methyl Alcohol in Varnish—From time to time isolated instances of wood alcohol poisoning have occurred among men employed in varnishing the interior of vats in breweries which stimulated the New York health department to eradicate the use of wood alcohol for the purpose of varnishing vats in breweries Accordingly the commissioner of health addressed a letter to all breweries with offices in New York asking their cooperation in prohibiting the use of wood alcohol in their respective plants At the recent meeting of the Brewers Board of Trade, resolutions were adopted prohibiting the use of methyl alcohol in their plants for varnishing purposes to which thirty-seven New York and nine New Jersey breweries have pledged themselves This action is significant as showing the superiority of the newer method of public health administration which makes effective use of persuasion rather than of legal compulsion

ANNOUNCEMENT

Owing to the amount of space occupied in this issue of The Journal by the index and the proceedings of the Annual Session, certain departments are abbreviated and others omitted

DISEASE DANGERS OF WAR WITH MEXICO

Two years ago The Journal[1] discussed the sanitary problems which must be met if our troops should have to go into Mexico for any length of time Today these problems should be considered again The state militia is mobilizing, large bodies of men are already being concentrated in camps and soon perhaps some will be moving to the Mexican border, if not into Mexico The guarding of the border is likely to be the duty which will fall particularly to the militia and less trained troops Actual invasion, if it should come, will no doubt devolve on the regular army

Typhoid and smallpox vaccination have practically removed the menace to life from these diseases under military conditions The militia, however, has not been immunized against typhoid even approximately to the extent that the regular army has been vaccinated The danger from dysentery, which is still a menace to men in army camps, has been materially lessened through improvements in the preservation and protection of foodstuffs and through increased facilities for the transportation of supplies Amebic dysentery may be prevented by strict supervision of water supply and filth disposal The use of emetin in the treatment of this condition will aid in rapidly eradicating such cases as may occur Malaria and yellow fever, conquered through eradication of the mosquito and prevention of mosquito bites, are no longer to be feared Cholera, preventable by cleanliness, and typhus fever, the scourge of Mexico, also have been studied, and their prevention can be accomplished by the enforcement of adequate sanitary regulations

The sanitation of camps has developed into a science In the development of this science American investigators — many of them officers of the medical corps of the United States Army and of the Public Health Service — have led the way, and they may be depended on to carry out these measures to the fullest extent Typhus fever is particularly a Mexican problem It has been a factor in the present European war, and the measures instituted abroad show how completely this disease may be controlled Much has been said in connection with the European war of gas gangrene, tetanus and secondary wound infection The frequency of these infections has been attributed to the cultivation of the soil in the region in which the war is being conducted If this be the cause, this condition is certainly not to be feared in Mexico Much of the warfare in Europe has been trench warfare, and diseases peculiar to this method of warfare have frequently been discussed The problem in Mexico would appear to be a different one In any event, it hardly seems likely that the old saying that "disease kills more men than bullets" will hold true

We can be sure that American medical officers of every branch of the service will do all that is humanly possible to protect our soldiers in the field As a result of their service, the American soldier will be safeguarded so that the maximum number of efficient fighting units will be continually available to those concerned with the action of troops at the front

TRENCH NEPHRITIS

Special vocations have long been associated with the occurrence of forms of disease directly attributable to the occupations involved With the changes in the modes of life or kinds of work which they require and with the evolutions of new branches of industry and new forms of activity, the incidence and character of occupational diseases likewise may change New conditions of employment and unusual demands on the physiologic mechanism may create unique dangers, increased bodily strains or unexpected risks The professional neuroses have long been recognized under a variety of more popular names, such as writer's cramp, violinist's wrist, milker's cramp, tennis elbow, baseball pitcher's glass arm and dancer's cramp These consist for the most part of tonic contractions, with or without pain, intermingled at times with clonic shocks or tremors Practically every occupation has its neurosis Another group of occupational maladies is represented in miner's disease, in painter's colic, and analogous incidents of environmental dangers Not long ago the development of the new vocation of aviation called forth the report of a special disorder, mal des aviateurs, or aviator's disease, associated with aerial flights Trench foot is a modern expression

The practices and necessities in times of war likewise call forth innovations, not only in the character of the wounds received and the surgical aspects of the com bat but also in the domain of internal medicine Very striking in this respect are the reports, now published in some detail, of what has been termed trench nephritis for want of a more expressive name[1] Acute nephritis is not sufficiently common in civil practice among men of military age to attract special attention Among the older men, persons over 30 years of age, who have found their way into the troops engaged in warfare, there are undoubtedly cases of ordinary chronic renal disease in which the lesion was not very marked It is quite probable that under the stress of the campaign the disease may progress quite rapidly in such cases, or an acute nephritis may in some instances be engrafted on the underlying chronic defect In other cases, serious chronic renal disease of long standing may be present, but have failed of recognition earlier because of the absence of urgent symptoms prior to the onset of the subsequent uremia Aside from all of these recognized possibilities, however, there have been discovered among the invalided troops a large number of cases of nephritis of a type and incidence sufficiently unexpected to command serious attention Two prominent symptoms early attracted notice, the occurrence of edema and the presence of dyspnea, the onset of these manifestations often being quite sudden Dyspnea is not usually regarded as a common feature of acute nephritis apart from uremia or cardiac failure Possibly an outpouring of fluid into the lungs and pleural cavity may have been responsible for the shortness of breath Epileptiform seizures of the uremic type were sometimes observed, but did not present an invariable feature In defining the peculiarities which justify the designation of the cases as forms of a distinct nephritis, Sir John Rose Bradford has epitomized them as rapid subsidence of well marked renal dropsy, frequent presence of bronchitis and dyspnea, severity and suddenness of onset of uremic manifestations, such as epileptiform seizures, rarity of occurrence of inflammatory complications, and an extraordinarily low mortality With this the other observers, notably Capt Langdon Brown, are in substantial accord Most of them emphasize the ultimately favorable prognosis in the majority of instances In the larger number of the cases there has been no evidence either in the physical signs or in the patient's history to suggest the presence of a latent renal lesion The rapid subsidence of the severer symptoms and the disappearance of complications are not consonant with the existence of an acute nephritis complicating a chronic lesion of the kidney

---

[1] Disease Dangers of Mexican Invasion, editorial, The Journal A M A, May 2, 1914, p 1403

Trench nephritis affects men of all ages A large number of cases occur in quite young men, over 70 per cent out of 571 cases have been recorded in men under 35 years of age The malady has by no means been limited to those actually serving in the trenches Orderlies and others whose duties keep them at the base operations have succumbed Only about 1 per cent of the cases have occurred among officers, and these were not limited to any age The disease has apparently not been limited to the British troops in Flanders The German and Austrian armies also have been affected in the present war Sir William Osler has stated that there can be no doubt that this epidemic acute nephritis is a disease not heretofore described except as occurring in our own Civil War Langdon Brown is responsible for the statement that in the American campaigns over 14,000 cases were recorded He recalls that in the American Civil War the military conditions resembled those of the present European conflict in some important particulars There was the sudden dash of the Confederates northward, which was checked and followed by prolonged trench warfare

The most natural tendency in explanation of the newly described disease is to attribute it to exposure All of the close observers of the cases are, however, unwilling to accept this hasty conclusion It is pointed out that the nephritis was absent among the Indian troops, although they suffered in common with the British at the front from other maladies — frostbite, bronchitis, pleurisy, pneumonia—commonly attributed to exposure Furthermore, the number of cases of acute nephritis was very small until the spring of 1915 The disease did not attain epidemic proportions until after the days of severe exposure had been passed The number of cases increased as the summer came on

The facts at present available indicate that so-called trench nephritis or epidemic acute nephritis, a condition not frequently seen in civil life, is not merely accidental, but represents one with similar symptoms distributed over a large area and suggests that there is some common pathogenic factor responsible The possible origin of the disease as the result of etiologic agents familiar in ordinary practice has been considered by Wallis He believes that intestinal toxemias and mineral poisons, for example, can be excluded Dysentery and typhoid fever have been suggested as causes, but there is a lack of agreement between the curves of incidence of the intestinal and renal disturbances Alcoholism cannot be charged with complicity in this campaign, nor can such extensive outbreaks be attributed to intentional drugging by soldiers to render themselves unfit for service The claim that the antityphoid inoculation is responsible is not consistent with the rarity of nephritis among inoculated troops training at home

The simplest explanation of a common cause, not operative in all wars or in all places, and susceptible of variation apart from the clemency or inclemency of seasons and regions, would be a specific infection This is at present the most popular interpretation among the British observers This explains the designation "epidemic infectious nephritis," which has been received with favor It helps to explain the slow and gradual rise of the epidemic, which may easily thus be associated with the multiplication and spread of some causal organism Quite possibly this acts on the kidneys of patients who are particularly susceptible Here cold and exposure may play some contributory part The disease has not yet been experimentally transmitted to animals As a problem of grave importance and unusual scientific interest, it has reached a stage at which symptomatology and statistics must be supplemented by epidemiologic and etiologic investigations

DIABETES IN JAPAN

An unusual incidence of certain diseases has frequently been attributed in the past to an increased susceptibility or relative immunity, as the case might be, of certain races to the abnormal condition under consideration As instances, the alleged relative susceptibility of Melanesians to measles, of negroes to tuberculosis, of Malaysians and other oriental races to beriberi, and of those of European descent to yellow fever may be cited Some of these supposed correlations have been shown to be due to the inadequacy of statistics or the imperfections and shortcomings of diagnosis obtaining among the less civilized races in the past In other instances the supposed racial peculiarities of disease have been connected with the peculiar dietary habits of certain peoples or some peculiarly enhanced possibility of infection due to modes of living or geographic conditions In other words, the apparent interrelation between frequency of disease and races of people has doubtless often been due to enforced external or environmental factors rather than to actually inherited racial characteristics

Diabetes is one of the diseases for which an unlike susceptibility has been charged to different races Careful statistics are showing, according to the interpretation of Futcher, that the statement that diabetes is very uncommon in the colored race does not seem to be borne out by the facts In India, where the disease is reported to be common among the educated and commercial classes, it is said to be the Hindoos chiefly who suffer Diabetes has long been regarded as an uncommon malady in China and Japan The disease has even been regarded as somewhat different in character in Japan from the manifestations seen in America and Europe It is only in recent times, however, that useful statistics obtained in accord with the dictates of modern medical science have become available for some of the communities of the Far East A recent contribution by Iwai[1] of Tokyo furnishes some highly interesting facts in relation to diabetic disease in Japan Thus it is said to be uncommon either in hospital or in private practice to encounter diabetic patients presenting the classic symptoms of the disease polydipsia, polyphagia, polyuria and emaciation Consequently diabetes is rarely discovered except through the chance examination occasioned by some other simultaneous disorder The fact that augmentation of the volume of urinary secretion is almost never observed presumably explains why the incipient cases have not been detected in the past in Japan, and it likewise suggests the relatively mild type of the perversion Ketonuria is stated to be correspondingly uncommon as a symptom in those affected

As an indication of the relatively benign character of diabetes in Japan, Iwai states that without examination of the urine for sugar it would as a rule not be detected, and a reduction of the carbohydrate intake suffices ordinarily to make the glycosuria disappear The progressive increase in severity which is so familiar and difficult to combat is likewise not typical of the disease heretofore observed in Japan This malady is only infrequently a direct cause of death Out of 5,387 necropsies made in fourteen years at the University of Tokyo, only twelve cases of diabetes were reported, and death in these instances was due to complications,-most frequently to pulmonary tuberculosis and chronic nephritis

How is this infrequency and peculiarly mild type of diabetes among the Japanese to be accounted for? It can scarcely be associated with any natural restriction of carbohydrate in the diet On the contrary, the Japanese, as a nation are accustomed to consume a ration unusually liberal in carbohydrate, particularly in the form of rice As a rule they eat somewhat less of the flesh foods According to observations of Iwai, the Japanese usually exhibit a high tolerance to carbohydrate, as evidenced by the capacity to assimilate large doses of sugar without provoking an alimentary glycosuria Pending a better solution of the question raised by these interesting facts, it may be permissible to ascribe the relative immunity of the Japanese from diabetes, especially of the severer types, to racial characteristics which cannot as yet be more scientifically defined

Social Causes of Insanity—If certain occupations predispose to particular intoxications, if others facilitate special infections, or expose those concerned to intemperance, to overwork, or to insomnia, this does not alter in the slightest degree the biologic value of the intoxication, of the infection, of the overwork, as the cause of the insanity Social position, conditions of misery or affluence, the professions, business occupations, tend only to provide a predisposing environment, by reason of which certain individuals are more exposed to one group of causes than to others This is of the greatest importance from the sociologic point of view, and especially in regard to the question of prophylaxis, but it has nothing to do with the pathogenetic mechanism —Lugaro, Modern Problems in Psychiatry

Current Comment

THE PRESIDENT-ELECT

For the first time the presidency of the American Medical Association has been bestowed on the brother of a former president. So well known is the name of Mayo that it may seem unnecessary to present a biography of the President-Elect. The work that the Mayo brothers have done, the institution they have established at Rochester, Minn., are known throughout the country. Dr. Charles Horace Mayo was born in Rochester, Minn., July 19, 1865, the son of the late Dr. William Worrall Mayo and Louise Abigail Wright Mayo. He graduated from the Chicago Medical College in 1888, and at once began practice with his father and his elder brother, Dr. William J. Mayo, who was President of the American Medical Association in 1906. At that time St. Mary's Hospital in Rochester — which was the start of what has become known as the Mayo Clinic — had thirty patients. He was president of the Western Surgical Association in 1904, of the Minnesota State Medical Association in 1905, chairman of the Section on Surgery of the American Medical Association in 1907, and of the Surgical Section of the International Congress on Tuberculosis in 1908. The honorary degree of M.A. was conferred on him at the Northwestern University in 1902, and the degree of LL.D. at the University of Maryland in 1909.

President-Elect Charles Horace Mayo

A NEW DECISION UNDER THE HARRISON ACT

An important decision[1] interpreting the Harrison Narcotic Law was handed down by Mr. Justice Holmes of the United States Supreme Court last week. A Chinese doctor had issued to an alleged addict a written prescription for 1 dram of morphin sulphate. The addict was not registered with the collector of internal revenue of the district, and had not paid the special tax required of those who register under the act. The government argued that possession by the addict of this amount of opium came under Section 8 of the Harrison act, which declares it unlawful for "any person" (with certain specified exemptions) who is not registered and has not paid the special tax to have in his possession or control any of the drugs to which the act applies, "such possession or control" being held presumptive evidence of a violation of the act. The indictment charged the defendant physician with conspiring with the addict to place the drug in his possession. It was further alleged that the defendant physician did not issue his prescription in good faith for medicinal purposes, but for the purpose of supplying a morphin addict. The indictment was quashed by the district judge on the ground that the act was a revenue act, and that the words "any person" must be confined to the class of persons with whom the act previously had been purporting to deal. The contention of the government, on the other hand, was that the act was one of several passed in order to carry out the International Opium Convention, that, under the guise of a taxing measure, given to afford it "a coating of constitutionality," it really was a police measure that strained all the powers of Congress. The case came before the Supreme Court from the United States District Court for western Pennsylvania. The court in its decision stated that a statute must be construed, if fairly possible, so as to avoid not only the conclusion that it is unconstitutional, but also grave doubts on that score. On the hypothesis that opium is produced in the United States (which is assumed by Congress in the act itself), an attempt by Congress to make possession of opium a crime would raise a grave question of constitutionality. "Only words from which there is no escape could warrant the conclusion" that Congress meant to strain its powers almost to the breaking point to make the possession of opium a crime Hence the Supreme Court, concluding that the measure is to be treated as a revenue measure, and that "any persons" refers to the persons required to be registered, affirms the decision of the lower court We have gone thus far into the legal aspects of the case because of the importance of its bearings It appears that, while certain classes of persons (including physicians) are amenable under the law for their dealings in narcotics, those classes of persons who are not named in the act are not accountable under it for the mere possession of such drugs This decision, which places the more responsible classes of persons under the purview of the law, and exempts the irresponsible, is bound to create, at first, a certain amount of misunderstanding and resentment Sober reflection however, will remind us that the occasional occurrence of such anomalies is inevitable under our constitutionally limited federal government In passing the Harrison act as a revenue measure, Congress has apparently done all that it could do toward placing the traffic in narcotics under control, and the courts, in interpreting the act as a revenue measure, are merely keeping it under the shelter of the constitution Further police measures, if desired, must be enacted by the several state legislatures It is worthy of note that the decision of the Supreme Court was not unanimous, Mr Justice Hughes and Mr Justice Pitney dissented

[1] The United States, Plaintiff in Error, vs. Jin Fuey Moy. In Error to the District Court of the United States for the Western District of Pennsylvania.

THE DETROIT MEETING

The Detroit session of the American Medical Association was most successful, both in attendance and in scientific work The attendance — 4,586 — marks the third largest meeting, the largest — 6,466 — being the Chicago meeting in 1908, and the second — 4,722 — the Boston meeting, held in 1906 Although the attendance was large, every one was provided with comfortable quarters because the local profession, influenced no doubt by the prevailing spirit of "preparedness," had made ample arrangements for those who could not be accommodated in the leading hotels All the sections report unusually good attendance, excellent papers, and instructive and practical discussions Detroit was generous in supplying automobiles for the transportation of physicians in attendance most of the automobile manufacturers supplied cars and the local profession as well as the citizens of Detroit gave the use of their cars freely In spite of the fact that the meeting places were scattered, physicians had no difficulty in going from one meeting to another The local Committee on Arrangements is to be congratulated on its management every detail had been considered and nothing was lacking to make things run smoothly The entertainments were lavish, and the social functions most delightful In a word, the meeting was a success in every way The medical profession of Detroit and of Michigan is to be commended not only for its generous hospitality but for the constant courtesy accorded to those who attended the meeting In these efforts the medical profession was heartily supported by the people of Detroit

AN EPOCH-MAKING SESSION

The Detroit session promises to be the most epoch-making of any since 1901 for two reasons First, and more important, was the creation of the office of Chairman of the House of Delegates This will relieve the President of the Association of the task of presiding over the House of Delegates The president is usually elected on account of his scientific attainments, and not because of his ability to preside over a deliberative body This new order of things will be a great relief to the President, and will give him time to attend to and participate in the functions which naturally appeal to the presiding officer of a great scientific body such as the Scientific Assembly has become On the other hand, the House of Delegates will be presided over by a man selected because of his knowledge of the activities of the Association, of the procedure of the House of Delegates, and on account of his ability as a presiding officer The House selected as its first Chairman, Dr Hubert Work of Pueblo, who for many years was a member of the House and who is thoroughly conversant with its procedures The second epoch-making change is that which provides that the opening meeting of the Scientific Assembly — the General Meeting — shall be held on Tuesday evening, the scientific sections to convene on Wednesday morning instead of on Tuesday afternoon as heretofore The main object of this change is to give the House of Delegates two days for its deliberations before the opening of the Scientific Assembly It is unnecessary to dilate on the importance of this change so far as the House of Delegates is concerned, many men have hesitated to serve as members of the House because that work has prevented them from attending the sections Under the new order of things the great probability is that the House of Delegates will complete its work on Tuesday, except for the election of officers, and business incidental to its closing meeting The change will also be of decided advantage to the Scientific Assembly Heretofore the Scientific Assembly commenced Tuesday morning, the first half day being taken up with the opening general meeting Hereafter the opening exercises will take place on Tuesday evening, and the scientific sections will begin their programs on Wednesday, continuing through Thursday and Friday, meeting both morning and afternoon

---

Philadelphia County's Burden for Dependent Children Increased—An investigation into the causes of juvenile dependency undertaken by the committee representing allied organizations for child welfare in Philadelphia has directed attention to the startling growth in the financial burden of the County of Philadelphia for the maintenance of children of indigent and delinquent parents which has increased from $4,599 02 in 1909, to $290,924 07 in 1915 The result of the investigation showed that the county is being defrauded by parents who got rid of children from sheer avarice and that several institutions are receiving money for the support of children long past the age of dependency, that certain charitable organizations engaged in farming out dependent children to families in country districts are receiving money for the support of children who had returned to the care of their parents Within a week following the establishing of the bureau of children's agents and investigators the officers of various charitable organizations voluntarily asked the municipal court for the discontinuance of more than [illegible] orders for the support of children placed in their care

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest such as relate to society activities, new hospitals education, public health etc)

ILLINOIS

Sanitary Survey—The sanitary survey of Champaign-Urbana will begin, July 1, under the charge of the state board of health working in cooperation with Dr William E Schowengerdt, Champaign

Sanatorium Opened—The formal dedicatory exercises of the Rockford Memorial Sanatorium for Tuberculosis were held, June 10, when Dr Daniel Lichty, president of the board of trustees of the institution tendered the property to the city, and Mayor W W Bennett accepted the institution on behalf of the city Dr George W Webster, Chicago, formerly president of the state board of health, delivered the principal address

Successful Four-Day Campaign.—The campaign undertaken in Highland Park to raise funds for the erection of a hospital culminated, June 12, at a mass meeting held at the Deerfield High School at which it was announced that instead of $100,000 the amount required, $167,000 had been subscribed by men and women of the north shore for this hospital which is to be nonsectarian, and is to be used by residents of Highland Park, Deerfield, Highwood and Ravinia

Chicago

Jackson Park Sanitarium Opened—The Jackson Park Sanitarium for sick babies at LaRabida opened for the season, June 12

Fund for Tuberculous Children Sought.—Thus far $2,500 has been obtained of the $3,000 required to send 250 tuberculous children from the stockyards district to Camp Harlowarden, near Joliet, where they will be cared for from June 26 until September 2 Donations will be received by Mr George M Benedict, Drovers National Bank, treasurer of the organization

Personal—Dr John B Murphy has been made knight commander of the Order of St Gregory the Great by Pope Benedict XV The collar and golden octagonal cross of the order were conferred on him by Archbishop Mundelein at the exercises attending the formal opening of the new addition to Mercy Hospital, June 15 Chancellor E F Hoban read the papal brief and the Archbishop invested Dr Murphy with the collar and cross of the order——Dr Felix Kalacinski has been appointed a member of the state board of health, vice Dr Adam Szwajkart, resigned, on his appointment as county physician of Cook County

Sanatorium Committee to be Permanent.—The committee of one hundred created, March 31 for the benefit of the Municipal Tuberculosis Sanatorium met, June 16, and adopted an aggressively constructed program of action Mr E A. Bancroft presided and Dr Frank Billings, chairman of the executive committee, reported on the need of a permanent organization to discover and interpret facts and to help embody them in programs of action Mr Frank E Wing formerly business director of the sanatorium, was appointed executive officer of the committee of one hundred, and instructed to open offices in the loop district

State University Medical School News—Work on the first unit of the new University of Illinois Medical School plant is to be started immediately with the erection of an eight-story clinical building to cost $250 000 This building will provide a dispensary, operating rooms a floor for medical cases one for surgical cases and one for obstetric cases——The opening exercises of the Graduate School of Medical Science of the University of Illinois were held at the College of Medicine, June 20 After introductory remarks by President Edmund Janes James of the University of Illinois, Dr Frank Billings delivered an address on 'The Relation of Graduate Work in the Fundamental Sciences to Clinical Study ' Announcement of the lectures for the graduate course quarter, which extends from June 20 to September 12, are to be made by weekly bulletins and all interested in graduate work are invited to attend

Chicago Pledges Four Base Hospitals—Mr A A. Sprague II chairman of the Chicago Chapter, Col Jefferson R Kean M C., U S Army, director general of military relief, and John J O'Connor, director of the Central Division, American Red Cross, held a conference June 19, which resulted in the pledging by Mr Sprague, for the chapter, of four base hospitals for Chicago, each containing 500 beds at a total cost of about $160,000 These hospitals, each with its attendant field columns, to be used in transporting patients from field hospitals to evacuation and base hospitals, will immediately be established and fully equipped Contributions toward the establishment of the hospitals will be received by Mr Orson Smith, treasurer of the local Red Cross chapter At a later conference between Colonel Kean and Chicago members of the National Committee on Medical Red Cross service, including Drs Frank Billings, John B Murphy, Albert J Ochsner, Arthur Dean Bevan, and Franklin H Martin, the personnel of the hospital units and field columns was discussed Each base hospital will consist of 196 persons, including a director, staff surgeons, nurses, nurses' aids, orderlies and cooks The four hospital units suggested are first, the combination of Wesley and Mercy hospitals under the charge of Dr John B Murphy, second, St Luke's and Michael Reese hospitals in charge of Dr Lewis L. McArthur, third, St Joseph's, Augustana and St. Mary of Nazareth hospitals, under the control of Dr Albert J Ochsner, and fourth, Presbyterian Hospital in charge of Dr Frank Billings

INDIANA

Sanitary Inspection of Summer Resorts—The state board of health has made sanitary inspection of all the summer resorts of Indiana, and has requested that employees of hotels and all who have to handle food be compelled to undergo an examination to determine if they are suffering from any infectious disease

Fresh Air School Closes—The Fresh Air School, Indianapolis which has been in operation for two years, has closed its annual session with an attendance of fifty pupils, with an average gain of 8 18 pounds per pupil The school is conducted under the supervision of the Marion County Society for the Prevention of Tuberculosis

Personal—Dr James H Taylor has been elected president of the Indianapolis Board of Trade——Dr Melville F Johnston has been unanimously reelected a member of the Richmond school board——Dr Samuel E Smith, superintendent of the Southeastern Hospital for the Insane, Richmond has been elected alumni trustee of the University of Indiana

MARYLAND

Personal.—Dr Edward L Whitney of the staff of the University of Maryland and formerly associated with the Baltimore Medical College before its absorption into the University of Maryland, has entered into private practice in Portland, Ore——Dr Thomas A. Ashby, who has been ill at his home in Baltimore for several weeks, is reported to be improving

Staff Society Formed—At a recent meeting of the Mercy Hospital staff, Baltimore, a society was formed to conduct scientific meetings and to meet monthly The papers read and the cases presented are to be given by members of the house staff while the visiting staff will open the discussions All former residents of the hospital have been elected alumni members, and the visiting staff were elected honorary members of the society The following officers were elected chairman, Dr Erwin E Mayer vice chairman, Dr Richard O'B Shea, and secretary, Dr Thomas K Galvin

Hygiene School for Johns Hopkins University—The Rockefeller Foundation will establish its School of Hygiene and Public Health in connection with the Johns Hopkins University, and Dr William H Welch will be the director of the school, with Dr William H Howell as head of the physiologic division It is expected that the school will be opened in October, 1917, as it is estimated that a year will be required for the planning, construction, and equipment of the building and the gathering together of the staff of teachers The necessary funds for construction, equipment, maintenance and expenses of the school will be provided by the Rockefeller Foundation The school, while working in cooperation with the medical school as well as with the school of engineering will have an independent existence. Opportunities in each will be available to students in the other schools The central and principal feature of the school will be an institute of hygiene housed in its own building, provided with the requisite laboratories and facilities and with its own staff of teachers giving their entire time to the work of teaching and investigating There will be laboratories of sanitary chemistry, of physiology as applied to hygiene, of bacteriology, and protozoology, and provision for epidemiology, industrial hygiene, vital statistics, a museum, library, etc Additional *facilities for instruction and research* will be supplied by the medical and the engineering schools, the hospital, especially the newly opened wards for infectious diseases, and other departments of the university, which will be aided in undertaking the new work It is anticipated that mutually helpful relations will be established with the municipal and state departments of health, and with the federal public health service, whereby opportunity will be afforded for field service and other practical experience in various branches of public health work Especially advantageous will be the relations with the International Health Commission of the Rockefeller Foundation, which is engaged in the study of hookworm, malaria, yellow fever and other tropical diseases, which will receive due attention in the work of the institute

MASSACHUSETTS

Essex North District Society Doings—At the annual meeting of the Essex North District Medical Society, May 5, it was voted that "the society instruct its councilors to urge the council of the Massachusetts Medical Society to use every legitimate means and procure an amendment to the Workmen's Compensation Act which will give the insured freedom of choice of medical attendance" Some of the insurance companies who carry all employer's risks are insisting that certain contract physicians only be allowed to treat the patients and are refusing to pay the family physicians A recent decision of the supreme court of the state so interprets the present law——The summer outing of the society was held on the grounds of the Merrimack Valley Country Club, Methuen, June 14, where a program of sports was provided, and dinner was served

NEW MEXICO

Higher Preliminary Requirements—An official communication just received from the New Mexico Board of Health and Medical Examiners states that beginning with January, 1918, the standard of preliminary education for all students matriculating in medical colleges recognized by that board will be two years of college work The requirement will apply to all those who graduate after Jan 1, 1922

NEW YORK

Alumni Election—At the annual meeting of the Alumni Association of the Medical Department of the University of Buffalo, held in Buffalo, May 31 the following officers were elected president, Dr Walter D Greene, '76, Buffalo, vice president, Dr William H Bergtold, '87, Denver, secretary, Dr Julius Richter, '04, Buffalo, treasurer, Dr Frank E Brundage, '09, Buffalo At the annual dinner, held June 1, at the Hotel Stattler, Dr John Parmenter, Geneva, presided

Health Officers' Conference—At the opening of the sixteenth annual conference of Health Officers of the State in Saratoga, June 6, Dr Hermann M Biggs, state commissioner of health, in his opening address, asserted that during the last two years notable advances have been made in combating all communicable diseases, and the death rate of infants has been reduced from 121 to 99 per thousand The rate should, however, be brought down to 65 or 70 per thousand June 7, the subject for the day was "Communicable Diseases," and on June 8, "School Hygiene"

New York City

Infantile Paralysis—June 17, announcement was made of the discovery of a group of cases of infantile paralysis in Brooklyn Up to that date, twenty-four cases had been reported, fourteen in the district lying between Henry Street and Seventh Avenue and Baltic and First streets The cases are mild in character, and so far have appeared principally in infants and very young children The department calls attention to the fact that diagnosis of suspected cases of infantile paralysis is aided greatly by an examination of cerebrospinal fluid, that such examinations are made free of charge in the laboratory of the department, and that physicians trained in the diagnosis of the disease will consult with any attending physicians on request

NORTH CAROLINA

Commemorate Health Work in Bladen County—At Elizabethtown, June 24, the first county health commencement ever held in the state was celebrated The occasion is the culmination of a three months' health campaign which has been conducted by Dr Thomas M Jordan, Raleigh, against pellagra and preventable diseases In addition to the commencement exercises there was a picnic and sports

Medical Inspection of Schoolchildren—In the May issue of *Our Communal Health*, the organ of the Consolidated Board of Health of Wilmington and New Hanover County, the medical inspection of schoolchildren during the past year is reviewed Of the 637 children examined by Dr John Thames, Wilmington, assistant health officer, there were found thirty-three cases of defective vision, four of which were corrected, seven cases of defective hearing, of which two were corrected, 160 cases of enlarged tonsils and adenoids with seventeen corrections, 281 cases of defective teeth with fifteen corrections, 134 cases of neglected and diseased scalps, of which eighty-five were corrected, twenty cases of pediculosis, all of which were corrected, and 114 cases of defective nutrition, of which eighty-six were corrected A card index was prepared covering the personal and physical condition of each child, together with such disease history as could be obtained

OHIO

Personal—Dr Frank G Boudreau, Columbus, has been elected executive secretary of the state board of health, succeeding Dr Eugene F McCampbell

Mental Hygiene Society Organized—Forty-four physicians and sociologists of Ohio met in Cleveland, May 17, and organized the Ohio Society for Mental Hygiene Mr Clifford W Beers, New York, secretary of the National Committee for Mental Hygiene, outlined the scope of the movement Dr Arthur F Shepherd, Columbus, was elected chairman and empowered to name a committee on permanent organization to meet at call of the chairman

PENNSYLVANIA

Dog Quarantine—The state health department, June 16, established a general quarantine against rabies in Delaware, Chester and Camden counties The Delaware County quarantine includes Chester and all boroughs Notice of the quarantine is being posted in all districts where rabies has been discovered The Media Council requested establishment of a quarantine because of six cases of rabies and as many dogs had been bitten

Personal—Dr James E Silliman, Erie, was elected medical director of the Pennsylvania Department of the Grand Army of the Republic at its fiftieth annual encampment held in Harrisburg, June 8——Dr Jonathan C Biddle, superintendent of the State Hospital, Fountain Springs, was the guest of honor at a meeting held at the State Hospital, June 8, on the occasion of Dr Biddle's sixty-second birthday anniversary——Dr Daniel A Webb, Scranton, who sailed for Europe early in May, arrived safely in London and expects to be transferred to duty with the Harvard unit in France

Philadelphia

Hospital Memorial Unveiled—A stone brought from the battlefield of Gettysburg bearing a bronze tablet commemorating the service of the patriotic men and women who administered to more than 20,000 wounded soldiers during the Civil War at the Satterlee General Hospital, was unveiled, June 10, with impressive ceremonies The memorial was erected by subscriptions conducted by the Forty Ninth Street Station Association, the Cedar Avenue and Chester Avenue Improvement Associations

Military Training Camp for High School Students—Dr Joseph Leidy, '87 M, has offered to place at the disposal of the board of education a tract of 40 acres of land at Penllyn for a military training camp for high school students during the summer months In his letter, Dr Leidy says in part "The lay of the land adjacent to the upper Wissahickon, with ample supply of pure drinking water, makes it an admirable location for such use The surrounding country is rich in Colonial history If the students of our public schools are to profit from the advantages of a summer camp this year, the work should be undertaken immediately, and not postponed until the season is too far advanced"

Second Ward Has Own Health Bureau—An experimental laboratory has been opened at the corner of Twelfth and Carpenter Streets, where the citizens of the Second Ward are being taught the reasons for cleanliness, the need of milk inspection, etc Medical inspectors, district doctors, visiting nurses in the employ of the city members of the board of inspectors and officers of the Bureau of Housing and Sanitation are all doing their work in the Second Ward, with the health center as their headquarters The entire ward is included in the experiment Housing conditions will be made the subject of study by the housing experts The cleanliness of the streets, and the condition of the sewage will be studied

Personal—Dr Herman A Bray delivered an address recently before the first graduating class of the Nurses' Training School of the Lebanon Hospital Philadelphia——Dr Levi J Hammond of the Methodist Episcopal Hospital delivered an address before the Lancaster City and County Medical Society June 7 on "Diseases of the Pancreas"——Dr J Stuart Rodman has been made permanent secretary to the National Board of Medical Examiners, which will hold its first examination in Washington D C., October 16——Dr Max Minor Peet, instructor in the Surgical Research Department of the University of Pennsylvania, will resign his post, July 1, to accept an appointment as instructor in surgery in the University of Michigan Ann Arbor——Dr Earl C. Peck of the Germantown Hospital has been appointed chief assistant resident physician at the Hospital for Contagious Diseases

Tribute to Dr White—Trustees of the University of Pennsylvania June 12 paid a noteworthy tribute to the late Dr J William White surgeon and author, who was a member of the board of trustees from 1911 until his death when they adopted a memorial prepared by former attorney Dr John C. Bell in which is reviewed Dr White's eminent service in behalf of the university beginning with his career as student almost fifty years ago and continuing through his life and in his will, which provides several endowments to the university activities A high mark of respect also is paid to his career in many fields as a benefactor, surgeon, author, and public citizen

TEXAS

Personal.—Dr Edward H. Cary, Dallas, president of the State Medical Association of Texas had conferred on him the honorary degree of LL.D by Baylor University, Waco, June 7——Dr Walter H Moursund Dallas, pathologist of Baylor Medical College has been appointed staff pathologist and placed in charge of the laboratory——Dr John M Neel, Dallas has been appointed county health officer, succeeding Dr Taylor C Gilbert, who has been called to San Antonio for service with the National Guard of the state

Railway Surgeons Organize—The Texas Railway Surgeons Association was organized at a meeting at San Antonio, June 1 The principal address of the session was delivered by Dr William B Collins Austin state health officer, on 'Public Health and Railway Sanitation, Proper Handling of Typhus Fever The following officers were elected president Dr Robert W Knox, Houston chief surgeon of the Sunset-Central Lines in Texas, vice president, Dr Joseph H Reuss Cuero, chief surgeon of the San Antonio and Aransas Pass Railroad and secretary-treasurer, Dr Douglas Largen, San Antonio local surgeon of the San Antonio and Aransas Pass Railroad

WISCONSIN

Typhoid Damage Suits Dropped—Five suits against the city of Milwaukee in which $50 000 damages were claimed for five deaths alleged to have been due to drinking water during the recent typhoid epidemic, were dismissed by Circuit Judge Gregory, June 1 on agreement of E. L. McIntyre first assistant city attorney, and John A. Jastroch, council for the plaintiffs

Personal.—Drs Bernard H Oberembt and John E Rueth, Milwaukee, sailed for Germany June 17, under the auspices of the American Surgeons Expeditionary Committee.——Dr H. Christian U Midelfart, Eau Claire has been unanimously elected chairman of the council in charge of the Luther Hospital campaign.——Dr Reuben J Elliott Milwaukee, past surgeon general of the United Spanish War veterans, and first assistant surgeon at the National Military Home, Milwaukee, was the principal speaker at the banquet of the organization in honor of Commander-in-Chief L. C. Dyer June 1——Dr Thomas C. Clarke Oconto has assumed charge of the Oconto County Hospital

Laboratory for Rhinelander—The state board of health has established a laboratory at Rhinelander and has placed Mr A A Sliwinski, formerly of the staff of the State Laboratory, Madison, in charge of the institution This laboratory is ready to examine sputum for bacilli, to examine swabs for diphtheria or other significant organisms, to examine pus from gonorrhea or other pyogenic infections, to examine the central nervous system of animals suspected of rabies, to examine spinal fluid for the meningococcus or other organisms, to examine specimens and suspected cases of anthrax glanders or actinomycosis, to examine feces and urine for suspected cases of typhoid carriers and in suspected cases of bacillary dysentery, to examine blood in suspected cases of typhoid and to make bacteriologic and chemical examinations of water to ascertain its potability All these examinations will be made free of charge, all that is required being that the specimens be sent prepaid, that accurate and adequate data accompany each specimen and that they be properly packed and marked.

CANADA

Hospital News—The Ontario Military Hospital, Orpington, England, has now over three hundred patients and the entire hospital of 1,040 beds will soon be filled——Mr Harold Kennedy, lumber merchant, Quebec City, who has already placed the Bromley Hotel, London, England, at the disposal of the Canadian Medical Service as a convalescent hospital, has now acquired an estate near Maidstone, England, for similar purposes The estate comprises 5,000 acres——Lieut Col Henry D Johnson, Charlottetown P E I., has been detailed for duty with the Canadian medical forces in France Maj Frederick Guest, St Thomas, Ont., succeeds him as commandant of the convalescent hospital at Buxton, which is full with over 300 Canadian soldiers suffering from rheumatism and allied complaints——The accommodation of the Canadian section of the hospital at Epsom, England, has been increased by 1,000, making the total now 2,500 beds Epsom will soon be devoted entirely to Canadian soldiers which will give 3 800 beds——Maj Irving of Toronto, who is commandant of the Dalhousie University Hospital, Halifax, N S, has embarked for France——The Victoria Hospital, Fredericton, N B is to be enlarged by a new wing This is rendered possible by a gift of the late Mr Donald Frazer of that town It will likely be completed during the present year——The Orillia General Hospital (Ont) is to be enlarged The necessary funds for the enlargement of the Essex (Ont) Tuberculosis Hospital having been provided by Mr Gordon McGregor of the Canadian Motor Company, an addition is to be added in the near future It is situated at Union-on-the Lake, Ont——The town of Ingersoll, Ont, having failed in its application to the courts for the setting aside the terms of the will of the late Dr Daniel W Carroll of that town, his residence will be converted into a Protestant Hospital for Sick Children, and will be maintained partially out of the fund of $12,000 bequeathed by Dr Carroll for the purpose——The Jeffrey Hale Hospital, Quebec City, is to open a tuberculosis ward——The legislature of British Columbia has granted $20,000 to the Vancouver General Hospital Most of this amount will go for the new surgical wing McGill University began a summer session in medicine on the first of May By attendance at this session medical students may complete their course and so be available for overseas service in the Canadian Army Medical Corps Several fifth year students recently returned from the front for this session——The Medical Department of the University of Toronto is holding a summer session from May 1 to November 30, and about sixty men are in attendance They will enlist for overseas service on graduation——Queen's University, Kingston, Ont., is holding a summer session for second third, fourth and fifth year medical students——The Faculty of Medicine, Dalhousie University, Halifax N S., has inaugurated a course of lectures on medical ethics Prof D Fraser Harris lectured on the relations of the practitioner to the patient, Prof William H Hattie lectured on the relation of the practitioner to his brother practitioners and Dr John G McDougall spoke on the relations of the practitioner to the public.——The medical students of Manitoba University who were to have been graduated in 1917 are being given a summer session and on receiving their degrees in the autumn, some will embark for overseas service.

GENERAL

States Have Adopted Army Standard—The secretary of war, in a telegram received at the Central Department, June 18 advises that all states in the department have adopted for the militia, the standard physical examination prescribed for the regular establishment

No Training Camps this Year—On account of the precarious condition of affairs on our southern border, the sanitary training camps planned at Fort Benjamin Harrison, Indianapolis, from July 5 to September 5, have been abandoned and the post will be used as a mobilization camp for the Organized Militia of Indiana Field Hospital No 1, U S Army, under command of Maj William W Reno, M C, U S Army, and Ambulance Company No 1, under command of Capt Condon C McCormack, M C, U S Army, which had been ordered to Fort Benjamin Harrison for duty during these camps, have been diverted and are waiting orders for the Southern frontier

Southern Railway Surgeons Meet—At the annual meeting of the Association of Surgeons of the Southern Railway, held in Chattanooga, June 7, the following officers were elected president, Dr Cooper Holtzclaw, Chattanooga, vice presidents, Drs William H Armstrong, Rogersville, Tenn, Thomas F Robinson, Bessemer, Ala, Julius H Taylor, Columbia, S C, and Henry McHatton, Macon, Ga, secretary-treasurer, Dr Jacob U Ray, Jr, Woodstock, Ala (reelected for the twelfth term), and member of the executive committee, Dr F R Gobbel, English, Ind The prizes offered by the official journal for the best papers during the convention were awarded to Drs Edwin T Newell, Jr, Chattanooga, Tenn, Julius H Taylor, Columbia, S C, and Martin D Delaney, Alexandria, Va Jacksonville, Fla, was selected as the next place of meeting

Examination for Naval Medical Corps—The next examination for appointment in the Medical Corps of the Navy will be held about August 7 at Washington, D C, Boston, New York, Philadelphia, Norfolk, Va, Charleston, S C, Great Lakes, Ill, Mare Island, Calif, and Puget Sound, Wash Applicants must be citizens of the United States, and must submit satisfactory evidence of preliminary and medical education The first stage of the examination is for appointment as assistant surgeon in the Medical Reserve Corps and embraces anatomy, physiology, materia medica and therapeutics, general medicine, general surgery and obstetrics The successful candidates then attend a course of instruction at the Naval Medical School, which will begin about October 1 During this time candidates will receive a salary of $2,000 a year with allowances for quarters, heat and light, and at the end of the course, if successful, will be commissioned as assistant surgeons in the navy to fill vacancies Full information regarding the physical and professional examinations, with instructions as to the proper method of submitting formal application, may be obtained by addressing the Surgeon-General of the Navy, Navy Department, Washington, D C

Bequests and Donations—The following bequests and donations have recently been announced

University of Pennsylvania, to establish a professorship in surgical
University of Pennsylvania, to
research, $150,000, Hospital of the University of Pennsylvania, to
provide prizes for nurses and doctors, and Christmas presents for
children, $10,000, by the will of Dr J William White
St Joseph's, St Mary's, St Agnes' and Episcopal hospitals, Phila
delphia, each $200, by the will of Walter E Mooney
St Agnes' Hospital, Philadelphia, $3,000, Orthopedic Hospital, Phila
delphia, the clocks, furniture, books, pictures and remainder of the
estate amounting to nearly $33,000, the latter to be used in the construction of private rooms "to be used exclusively by gentlefolks who have insufficient means and are not proper patients for wards," by the will of Josephine R Monges

New York Medical College and Hospital for Women, contributions of $62,000 toward the $200,000 fund expected to be raised during the year, including $5,000 to endow a bed, from Mrs C A Wentworth, and $5,000 to endow a bed, by W S Gray

St Elizabeth's Hospital, Brighton, Boston, $1,000, by the will of Mary Murphy, Newton, Mass

Bowdoin College, Brunswick, Me, a donation of $27,000 to build an infirmary in memory of his son, Dudley S Coe, by Dr Thomas Upham Coe, Bangor, Me

Free Hospital for Women in Brooklyn, for the purchase of land if necessary, and for the erection and equipment of a suitable building to be used as a cancer hospital, interest in property at 511 Washington Street and 16 24 West Street, Boston, on the death of the daughter and sister of testatrix, Waltham (Mass) Baby Hospital $5,000, in memory of the daughter of testatrix, Alice M C Mathews, Convalescent Home of the Boston Children's Hospital, Wellesly, Mass, property at 9 Exeter Street, Children's Hospital, Boston, property at 1666 Washington Street, Boston Floating Hospital, property at 94 Beacon Street, Baldwinsville Cottage for Children, property at 71 73 Harvard Street, and 48 50 Burleigh Street, Cambridge, Vincent Memorial Hospital, property at 744 756 Washington Street, by the will of Mrs Anna Bolton Mathews

College of Physicians and Surgeons of Columbia University, New York, $100,000, as an endowment fund for cancer research, by the will of Emil C Bondy

St John's Guild, New York, $3,000, by the will of Miss Lillian Payne

New York Association for the Blind, the residuary estate amounting to about $100,000, by Mrs Ellen Corbett Stevenson

Methodist Episcopal Hospital, Brooklyn, a trust fund of $100,000, on the death of the beneficiary

New York Foundling Hospital, $10,000, by the will of Mrs Lizzie H Holme

For Vivisection Inquiry—Reference has heretofore been made (Feb 19, 1916, page 585) to a bill introduced into Congress providing for an investigation by the secretary of agriculture into experimentation on living animals Mr J M Whitty, secretary of the Vivisection Investigation League of New York, has recently visited Washington, D C, for the purpose of furthering the enactment of such legislation On June 17 he addressed an audience of twenty persons assembled under the auspices of the Anti-Cruelty League, an organization recently formed for the purposes indicated by its name, making the usual criticisms of vivisection The stock references to experimentation, so called, on human beings occurred during the course of the lecture, including references to Noguchi's inoculation of children with luetin, the intra-ocular use of tuberculin in an institution in Philadelphia, with alleged resulting impairment of vision in some cases and in others loss of sight, the subsequent use of tuberculin in a New York asylum, the use of a serum for immunization and cure of tuberculosis on children and the subsequent failure of the United States authorities to approve the preparation, the deaths of certain children in St Louis, after the injection of antimeningitis serum, and the alleged serious illness of certain persons in Brooklyn after the injection of antityphoid vaccine prepared by the New York City Board of Health The improvement that has followed the use of antityphoid vaccine in the United States Army and in other armies and under other conditions he attributed to sanitation, as he did also the improvement following the use of smallpox vaccine The gentleman had never heard of the federal law regulating the production and sale of serums and vaccines He made the remarkable statement that in New York City there are said to be 3,000 vaccines, antitoxins and serums on the market

A public hearing was set by the senate committee on agriculture for June 19, at which it is understood Mr Whitty was to appear

WAR NOTES

Medical Unit for War Service—Superintendent Dowling of the Boston City Hospital has organized a medical unit, for war service, composed of physicians and nurses, and reports that the organization is practically ready to take the field

Appeal for Surgical Instruments—Mrs Russell A Alger, Jr, 2039 Penobscot Building, Detroit, who has recently returned from a trip to France, in which she visited many hospitals, especially throughout Brittany, where thousands of wounded soldiers are being treated, makes an urgent personal appeal for the donation of all kinds of surgical instruments, which are greatly needed in these hospitals She requests that such instruments may be sent to her at the address given above, whence they will be forwarded without expense to France, there to be distributed to the hospitals most urgently in need of them

PROCEEDINGS OF THE DETROIT SESSION

MINUTES OF THE SIXTY-SEVENTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT DETROIT, MICH, JUNE 12 16, 1916

(*Continued from page 1999*)

HOUSE OF DELEGATES

Second Meeting—Tuesday Afternoon, June 13

The House of Delegates met at 2 p m, and was called to order by the President, Rupert Blue, Washington, D C, who said

Before proceeding with the deliberations of this meeting, I desire to thank the members of the House of Delegates for the honor which they have conferred on the Public Health Service by electing its Surgeon-General to the high office of President of this Association While I cannot feel that this action is taken because of any worth of mine, I am none the less personally deeply grateful

The secretary called the roll and announced a quorum present.

The minutes of the previous meeting were read and approved

Supplementary Report from Committee on Credentials

Dr D Chester Brown, Connecticut, chairman, presented a supplementary report of the Committee on Credentials

Report of the Committee on Scientific Exhibit

Dr Frank B Wynn, Indiana, chairman, presented the report of the Committee on Scientific Exhibit, which was referred to the Board of Trustees

The report is as follows

From the standpoints of variety, quantity and scientific excellence, the Scientific Exhibit is equal or perhaps superior to any previously given Particularization as to the forty-odd exhibits is impossible at this time To the local Committee on Scientific Exhibit, and to the hundred or more persons who without money and without price have labored so painstakingly and patiently in its preparation and presentation the Association owes a profound debt of gratitude. Their reward must be in the consciousness of sacrifice and service to our great profession.

It is interesting to observe that in the early history of this department of the Association, exhibits were almost universally of the museum type, illustrating anatomy and gross pathology Gradually these have given place to photographs, Roentgen-ray pictures and photomicrographs, to carefully worked out clinical and laboratory data. The microscopic and jar specimens today are more likely to be those showing the results of experimental study This does not mean that museum specimens should be abandoned as a feature of this work. Carefully prepared and well demonstrated, they will always carry a message of value to many persons in the Association They may not appeal to the laboratory experimentalist, but to the rank and file of membership they are good food, and the multitude of our profession must be fed on plain, wholesome scientific diet which all can digest

On the other hand, it is difficult to understand the position of the so-called practical physician who fails to see, in a research problem practical bearing It is the keen edge of science which lays open the slough of ignorance and lets in the healing light of truth

Another common delusion is that research investigations belong only to workers in hospitals and laboratories The correction of this error is one of the problems toward which the committee has directed most earnest effort In the highest sense of the words, every true and skilful physician is a research worker, every case a research problem The more carefully he uses his five senses, records, analyzes and weighs clinical data, brings to his aid the far-reaching knowledge of laboratory methods, the nearer to truth will he attain and the better doctor he becomes With these thoughts in mind your committee has labored not in vain Over a third of the exhibits presented at this session are by practitioners as distinguished from laboratory workers More and more those appearing before sections are presenting exhibits illustrative of their papers Thus does the scientific leaven grow

Cooperation is a slogan of the day which applies alike to big business and to medical organization It has occurred to your committee to inquire if the Scientific Exhibit might not be made the instrumentality for closer cooperation between the American Medical Association and the subsidiary societies The national Association cannot do everything relating to the profession of medicine, any more than the national government can act in all things for all the people. As state and county organizations attack and master problems with local or general bearing, they will pave the way for unity and power in the profession through the national body Accordingly, the committee has asked for exhibits from medical societies which would give evidence of initiative and activity along effective lines

For many years medical societies everywhere have promoted the propaganda for disease prevention, so that this movement has now acquired the momentum of popular approval, and seldom needs medical society support Closely related to the public health, but with social, moral and professional aspects, is the subject of criminal abortion This should be made the subject of medical society agitation and investigation The consensus of medical opinion is that there is an extreme laxness of public conscience toward criminal abortion What general practitioner has not been approached on this subject, not merely by the unfortunate girl but many times more frequently by married people? The newly married excuse themselves on the ground of youth, multitudinous social obligations, apartment residence where children are not wanted etc A few years ago a distinguished member of this Association, impressed by the prevalence of this criminal practice, presented before a gentlemen's literary club in a large city an essay entitled 'The Rights of the Unborn" The subject was treated in a scholarly and tactful manner, and deep was the chagrin of the essayist to have it received in a spirit of levity by those from whom a different attitude would have been expected This much for the culpability of the laity On the other hand, it is pertinent to inquire, if we are mindful of public duty, as individuals and as medical organizations in proclaiming the wisdom and righteousness of the family and pronouncing always our condemnation of those evil tendencies which lead to a decadent nation An exhibit is offered at this session dealing with this subject

So often have we as individuals and through medical organizations aided movements for disease prevention, that it is well to ask Is it not time we gave some attention to our own personal welfare? The motives which actuate commercial industrial and labor organizations are self-interest May it not be true that among the medical profession, conditions prevail which work hardships and injustice to our professional brethren and ought to be righted? Is not this an eminently proper subject for medical society investigation and action? An interesting and suggestive exhibit is presented by the Indiana State Medical Association, giving data collected dealing with this subject under the caption 'The Doctor's Welfare" It is interesting to observe that this same organization seventeen years ago inaugurated the first scientific exhibit in this Association

There are two concrete illustrations showing how medical societies may reach out in unthought-of ways for the betterment of the profession and for the public weal There are many statistical and cooperative investigations in which medical associations may engage, scientific, as opportunity suggests economic as related to the doctor s physical welfare and comfort social and recreational as bearing on his health happiness and efficiency, sociologic as showing how the physician with sympathy touches the "underworld' and unfortunate, how in the highest and best sense he becomes his brother s keeper" To bring about medical society activity and cooperation along these lines through the agency of the Scientific Exhibit is a question to which the committee has given most earnest thought and attention, with gratifying prospects of realization.

RECOMMENDATIONS

It is advised that the usual appropriation of $1,000 be made to cover the expenses of the Scientific Exhibit It is urged that the President of the Association be empowered to appoint at once a committee on awards consisting of three members, to the end that ample time may be given to the difficult and responsible task on hand

The committee deems it advisable to suggest the following changes in the method of organization and administration of the Scientific Exhibit

1 *Committee on Awards*—This committee should consist of three members, elected by The House of Delegates, on nomination by the Board of Trustees, each to serve a term of three years, the period of service of each to end on successive years

Comment This will insure greater thoroughness and continuity of effort, offering to exhibitors the satisfaction and stimulation which will be conducive to future endeavor

2 *Manner of Selecting the Director and Committee on Scientific Exhibit*—The director of the Scientific Exhibit to be elected by the House of Delegates on nomination by the Board of Trustees, he to select his colleagues on the Committee on Scientific Exhibit, subject to approval of the Board of Trustees

Comment This will safeguard the interests of the Scientific Exhibit and prevent the possibility at any time of a lapse through personal favoritism in the selection of the director or his colleagues

3 *Publication of Names*—The Committee on Scientific Exhibit should be published with the officers and other committees standing in THE JOURNAL regularly

Comment This will greatly aid the work of the exhibit Its value is certainly as great as that of any section Give it the dignity of the position it has won

4 *Stipulated Honorarium for the Director*—The committee is of the opinion that $1,000 or $1,500 would not be an exhorbitant sum for this purpose, in fact, it would comport with the type of man we believe should be selected to carry on this difficult and arduous task Seventeen years of continuous service in the supervision of this work warrants the chairman in making this recommendation For several years he has craved release from the burden of it all From time to time the longing has come to participate with you in other features of Association work, and then the appreciative and encouraging words of the many friends of the exhibit would persuade him to "stay yet a little while" Length of service must now be the excuse for yielding to impulse in seeking to place the burden on others Accordingly, I may speak frankly concerning matters which will affect my successor

The director who undertakes this responsibility faces no easy task Its success will involve not only constant thought and attention, but much real physical as well as mental strain He must be resigned to labor arduously several days before, and throughout the annual sessions, denying himself the privileges of section or other phases of the Association's activities He should attend meetings of medical men, and visit institutions and laboratory workers in the interest of the exhibit

He cannot manage the Scientific Exhibit by commercial standards In dealing with the clientele of patrons who make the exhibit possible, patience, tact and wisdom are necessary, sometimes real generalship is required to make it go He should furthermore be a man to command respect and support from scientific workers throughout the country—with head and heart and unflagging industry for scientific ideals Such labor and such sacrifices as he will be called on to make to insure the success and perpetuity of the Scientific Exhibit, the Association should not expect of him gratuitously Grant an honorarium becoming the dignity of the man and the service

Associated with the birth and growth of this child of the Association I would be recreant to duty and to the loyal support accorded all these years by the House of Delegates, the Board of Trustees and hundreds of scientific workers all over the country, were I to put this work aside lightly and without serious thought for its future growth and permanence The Scientific Exhibit will live because of what it is and what the Association stands for In sadness, but in confidence, I pass the reins to another—conscious that the idealism and virility of this great organization will ever insure the forward march toward scientific progress and service to our fellows

Supplementary Report of the Board of Trustees

Dr Philip Mills Jones, California, presented the following supplementary report of the Board of Trustees

In 1914, the House of Delegates passed the following resolution

> *Resolved,* That the Board of Trustees of the American Medical Association shall be permitted to accept, at their discretion, patents for medical and surgical instruments and appliances, as trustees, for the benefit of the profession and the public, provided, that neither the American Medical Association nor the patentee shall receive remuneration from these patents

For this, the Board of Trustees, in order to make possible the work of carrying out the desire of the House, requests that the following be now substituted

> *Resolved,* that the Board of Trustees of the American Medical Association may accept, at their discretion, to hold, to control and to manage, as trustees for the benefit of the people and the protection of the medical profession, such patents on chemicals, remedial or diagnostic substances, medical or surgical instruments or appliances, or anything whatsoever that may be used in the treatment of disease or infirmity and for which a patent may be issued, as the patentee may desire to convey to the American Medical Association for the public protection and benefit provided, that the patentee shall surrender all claim to remuneration from the royalties or otherwise on such patent or patents to the Board of Trustees of the American Medical Association, which Board of Trustees shall not exact from the manufacturer or producer under any such patent or patents, any royalty or other pecuniary compensation or return therefrom, unless, in the judgment of the Board of Trustees, the exaction of such royalty shall appear to be wise and just and for the better protection of the public or the medical profession

Dr Wendell C Phillips, New York, moved that the recommendation of the Board of Trustees be adopted

Seconded and carried

Report of Reference Committee on Legislation and Political Action

Dr E J Goodwin, Missouri, chairman, presented the report of the Reference Committee on Legislation and Political Action, as follows

To your Reference Committee on Legislation and Political Action has been referred the report of the Council on Health and Public Instruction and a statement from the Virginia State Board of Health

The report of the Council on Health and Public Instruction is a voluminous document reporting progress on the activities of the Association which brings the organization more intimately in touch with the public than does any other department of our Association The Council makes only one recommendation that requires action by the house, and that is in connection with the death of our beloved fellow worker Dr H B Favill, which we quote "In order that a proper appreciation of the life, character and professional activities of Dr Favill may appear on the records of the Association, the Council requests that a committee be appointed to draft suitable resolutions for adoption by the House of Delegates"

Your Reference Committee, bowed with grief and sorrow by our great loss, approves the recommendation and suggests that the President appoint the four remaining members of the Council on this committee

The effort to investigate present public health conditions, an undertaking endorsed by the House at the session of 1914 and again in 1915, is approved, and the program previously established by the Council to pursue this investigation is reaffirmed

The Council reports the appointment of a committee on social insurance which has been confirmed by the Board of Trustees, and that committee has presented an exhaustive statistical study of the medical profession of the United States on the ratio of physicians to population, their geographic distribution, and other statistical facts of importance to the profession This committee purposes to undertake in the near future (1) to educate the American medical profession in the general principles of social insurance, (2) to serve as a bureau of information for the medical profession in the various forms of social insurance both in European countries and in the United States, and (3) to appear before legislative bodies in this country when advisable for the purpose of fostering a friendly understanding between all parties concerned in health legislation and to protect the legitimate economic interests of the medical profession The broad scope of this initial report gives us our first insight of a subject which will soon become an important factor in the social and economic status of the practitioner of medicine, and prepares us to meet the new conditions as they arise Your Reference Committee approves this undertaking and in order that all members of the Association may be brought into close touch with the work of the social insurance committee, we recommend that each constituent state association be requested to establish a committee on social insurance to work in conjunction with the committee on social insurance of the American Medical Association

The success and popularity of Public Health Sunday, as well as the resultant influence on the people toward observing the law of hygiene and sanitation has induced the Council to close as well as begin our annual sessions with a public health demonstration Therefore, with the approval of the Board of Trustees arrangements have been made for addresses on public health topics on Friday afternoon, June 16, in the Lyceum Theatre The Michigan State Board of Health and the Detroit Department of Health are cooperating with our Council and have arranged for a public health parade just before the meeting

Of the other activities of the Council itself we need mention, with our approval only the work of the Medicolegal Bureau, the Standard Study Program for Women's Clubs originated by Dr S J Trumbine Secretary of the State Board of Health of Kansas, which has been adopted by the Conference on State and Provincial Boards of Health and the General Federation of Women's Clubs for general distribution to women's clubs throughout the country, and the large number and great variety of pamphlets on public health topics printed and distributed, there being pamphlets on forty-five different topics with a total distribution of 1,188,500

The subcommittees of the Council have continued their activities with most commendable zeal, and each shows very satisfactory progress The Committee on Women's and Childen's Welfare, when Dr Lenna L Means was made chairman three years ago, centered its activities on baby health work. The committee now reports widespread interest in the baby health movement, and expects the work to 'yield nation-wide results" Your Reference Committee desires to lay special emphasis on the great importance of this subcommittee, and in commending the members for their intelligent execution of their duties, urge on the constituent associations to seek first the assistance of this subcommittee and to use the American Medical Association score card in all local baby health movements The committees on cancer, conservation of vision and cooperation with the National Education Association are the other subcommittees and their work is endorsed, and their members commended for their unselfish labors

The statement from the Virginia State Board of Health referred to your committee in conjunction with the report of the Council on Health and Public Instruction, we found consisted of a protest against the survey of Virginia by the investigator of state public health activities The statement therefore should be lodged with the Council on Health and Public Instruction to which your reference committee recommends it be now referred

It was moved that the report be adopted

Seconded and carried

The communication follows

We the undersigned members of the State Board of Health of the Commonwealth of Virginia and likewise members of the American Medical Association hereby protest to the House of Delegates against the issuance, with the sanction of this association of the report of Dr C V Chapin of Providence, Rhode Island on *State Boards of Health*

In making this protest, we beg leave to assign the following grounds

1 Conditions in different sections of the United States are so diverse as to make it more than doubtful whether a system of comparative scoring or rating fair to all the States and to all their sanitary work can be devised.

2 If any fair system of comparative scoring be possible it is submitted that the relative importance of the various units of rating will be differently estimated by sanitarians of experience and that the organization and scope of an ideal State Board of Health would be debatable

3 Even were there substantial agreement as to the essentials it is submitted that a system of scoring if practicable at all could only be devised by the united thought and labor of sanitarians familiar with the peculiar problems of all sections and able to determine as far as may be possible the importance of the various endeavors of the different boards

4 It follows that a task of so much magnitude should not be left to one man it matters not how eminent he may be and that his system of scoring in the circumstances should not be published to the country as this association's deliberate judgment or as endorsed by its membership without further investigation

5 In view of these facts it is submitted that Dr Chapin might at least have given the boards whose work he reviewed the opportunity of correcting plain errors into which he had fallen Yet in spite of the statement in the foreword of the report that six months were given for verification the Health Commissioner of Virginia knew nothing of what was being done from the time Dr Chapin spent a few hours in his office until the printed report was received

6 As a result and altogether apart from the unsatisfactory and arbitrary method of scoring adopted by Dr Chapin plain errors of statement exist in those parts of his text and tables relating to Virginia and efforts to have errors corrected by Dr Chapin have been futile.

7 It is submitted finally that it is inadvisable for the American Medical Association to sponsor comparisons between the work of States differently peopled and with different climate and wealth certainly when such comparisons rest on the judgment of one man

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr Floyd M Crandall New York chairman presented the report of the Reference Committee on Amendments to the Constitution and By-Laws as follows

The Committee on Amendments to the Constitution and By Laws respectfully reports as follows

The Judicial Council in its annual report recommends that in Chapter III Section 1, of the By-Laws, the word 'day' be stricken out and the words "two days" be substituted The reference committee recommends the adoption of the following substitute for this suggestion of the Judicial Council

Regular Sessions —The House of Delegates shall meet annually on the Monday preceding the opening of and at the same place as the Scientific Assembly of the Association.

Amend Chapter IV, Section 3 of the By-Laws by striking out the word "third' and substitute the word 'second,' so that the section shall read

The election of officers shall be the first order of business of the House of Delegates after the reading of the minutes on the afternoon of the fourth day of the session of the House of Delegates (the second day of the Scientific Assembly)

Amend Chapter X Section 1, of the By-Laws by striking out the words "the general meeting shall be held at 10 30 a m on the first day of the Scientific Assembly' and insert the words "shall be held on the evening of Tuesday of the week of the Annual Session"

The remainder of the chapter shall remain as at present

Amend Chapter II, Section 2, of the By-Laws by striking out the whole section, and substituting in its place the following

Sec. 2 Limit of Time for Introduction of New Business —No new business shall be introduced in the House of Delegates after the second day of the Annual Session of the House of Delegates unless by unanimous consent and such new business so presented shall require a two thirds affirmative vote for adoption provided however that unless otherwise provided in these by laws new business referred to the House of Delegates by the officers of the sections the Trustees or by formal action of the sections themselves may be presented to the House of Delegates at any time preceding the meeting at which the election of officers shall take place.

The Judicial Council recommends an amendment to Article 9, Section 1 of the Constitution by adding the words 'a chairman of the House of Delegates" The reference committee recommends the adoption of the following substitute

The general officers of the Association shall be a President four Vice Presidents a Secretary a Treasurer and a Chairman and a Vice Chairman of the House of Delegates

As an amendment to this effect was submitted last year it is within the power of the House of Delegates to act on it at this session

The Judicial Council further recommends that the following section shall be added to Chapter IV of the By-Laws to read as follows

Sec. 4 The House of Delegates shall annually elect a Chairman and a Vice Chairman these officers to serve for one year or until their successors are elected and installed These officers must be Fellows of the American Medical Association and must have been Fellows of this Association for at least two years immediately preceding their election to this office They need not, however, be members of the House of Delegates, but they shall possess all powers of the presiding officer of that parliamentary body These elections shall follow the election of the Treasurer of the Association

Amend Chapter V, Section 1, of the By-Laws by striking out the words "at the meetings of the House of Delegates, and shall perform such duties as custom and parliamentary usage requires"

Add to Chapter V of the By-Laws the following

Sec 5 Chairman of the House of Delegates—The Chairman of the House of Delegates shall preside at the meetings of the House of Delegates and shall perform such duties as custom and parliamentary usage require He may at any time make suggestions in writing to the House of Delegates

Sec 6 Vice Chairman of the House of Delegates—The Vice Chairman of the House of Delegates shall officiate in the place of the Chairman during his absence or at his request In case of the death, resignation, or removal of the Chairman, the vacancy shall be filled by the Vice Chairman

Renumber Section 5 to be Section 7

The committee approves these amendments and recommends their adoption

Amend Chapter VII, Section 1, of the By-Laws by striking out the words "these Committees shall be nominated by the President and elected by the House of Delegates, unless otherwise provided for in these By-Laws"

Substitute in their place the following words "The standing committees shall be nominated by the President and elected by the House of Delegates, unless otherwise provided for in these By-Laws"

"Reference Committees and special Committees shall be nominated by the Chairman of the House of Delegates, and elected by the House of Delegates unless otherwise provided for in these By-Laws"

The Judicial Council recommends that the following paragraph be added to Chapter VII, Section 4, of the By-Laws

In all cases which arise between a constituent association and one of its component county societies, between component county societies of the same constituent state association and the component society to which said member belongs, and between members of different component societies of the same constituent state association, the Judicial Council of the American Medical Association shall have appellate jurisdiction in questions of law and procedure but not of fact

The committee approves this amendment, and recommends its adoption

The report of the Committee on Social Insurance having been presented in abstract by the Chairman of the Judicial Council, in connection with his regular report, it was referred to the Committee on Amendments to Constitution and By-Laws After hearing the statement of Dr F L Van Sickle of Pennsylvania, and on due deliberation, it was voted to refer that report to the Reference Committee on Legislation and Political Action

The following amendment to Chapter VIII, Section 6, of the By-Laws was presented to the chairman of the committee yesterday by Dr Robert M Funkhouser of Missouri As it was not presented to the House of Delegates, it could not be acted on The committee, however, considered the question at considerable length and decided to present it to the House at this Session

The amendment reads as follows

No person can become an associate Fellow who can be a member of the American Medical Association in the regular way

The Judicial Council recommends an amendment to Article X, Section 2, of the Constitution by adding to the section as it now reads the following

No Trustee shall be eligible to any other elective office, the term of which runs concurrently with the term for which the said Trustee has been elected

This being an amendment to the Constitution, it will necessarily lie over until next year

The Judicial Council also recommends an amendment to Chapter IV, Section 2, of the By-Laws by adding the following

No member of the House of Delegates shall be eligible to the office of President or Vice President, nor shall a member of the Board of Trustees be eligible for election to any other elective office, the term of which runs concurrently with the term for which the said Trustee has been elected

The committee approves this amendment and advises its adoption

The Reference Committee on Amendments to the Constitution and By-Laws proposes the following amendment to Chapter VII, Section 3, Paragraph (c) of the By-Laws

Eliminate the words "Committee on Transportation and Place of Session"

To bring the By-Laws into harmony, should this amendment be adopted, it further recommends that Chapter VII, Section 6, of the By-Laws, which defines the duties of the Committee on Transportation and Place of Session, be eliminated

Also that the sections following be renumbered

The report was read and considered seriatim On several motions, which were duly seconded and carried, the separate sections of the report were adopted

Dr Arthur T McCormack, a delegate representing the Kentucky State Medical Association, advised the House that the delegation from Kentucky, acting under instructions of that constituent state association, voted in the negative on the adoption of the recommendation of the Reference Committee on Amendments to the Constitution and By-Laws, giving the Judicial Council of the American Medical Association the appellate jurisdiction as recommended in the report of this Reference Committee, and asked that a minute be made recording this negative vote of the Kentucky delegation

Dr E F Howard, Mississippi, stated that the delegation from Mississippi desired that a similar minute be entered, noting the negative vote of that state medical association on this same subject

Dr W E Anderson, Virginia, moved that the report be adopted as a whole

Seconded and carried

Report of Reference Committee on Reports of Officers

Dr A R Mitchell, Nebraska, chairman, presented the report of the Reference Committee on Report of Officers, as follows

Your Committee on the Reports of Officers begs leave to submit the following

Membership

We note with regret and with sorrow the loss of 441 Fellows by death The other losses of 713 not eligible and 658 for nonpayment of dues but emphasizes the importance of holding close our present membership and also of the importance of continuing the campaign for adding every eligible physician to our ranks The loss of 1,540 by resignation is a very small figure, and is largely accounted for by many who retire annually from active service in the profession The addition of 3,293 to the Fellowship by transference from the subscription list is an evidence of the excellent business policy of the association—considering the fact that the number of graduates from medical schools has decreased from 8,035 in 1906 to 5,315 in 1915, or more than 33 per cent—the net gain of 815 is very satisfactory

The recommendation of your secretary that the affairs of the Medical Society of Wyoming be referred to the Judicial Council with power to act is endorsed by your committee

We endorse the action of the Board of Trustees in its expenditures necessary to further the splendid work of the Council on Medical Education This work is of such far-reaching importance and is being accomplished in such a thorough and methodical manner that it should receive the support and the commendation of all right thinking people

Recognizing the truth and the importance of the suggestion that "we are entering on a period of great changes in social organization, a period which will necessitate far closer organization of the people in all forms of activity, and that this particularly calls for united strength in opposing disease and further—that it is better that we should initiate the necessary changes than to have them forced on us" we most seriously recommend a continuance of the work through the forces now having it in charge Your committee endorses every word of the report which refers to The Journal of the American Medical Association and of the master mind which directs it, it is a never failing fountain of scientific information, a bond of union between Fellows of the Association—and it is ours

We recommend that the publication of the *Archives of Internal Medicine* and the *American Journal of Diseases of Children* be continued, and that the trustees supply the necessary funds to meet any deficiencies until the journals become self-supporting The American Medical Directory is a credit to our profession, and its publication should be continued It is so valuable that it seems probable to your committee that a moderate addition to its selling price would not reduce the subscription list.

Organization

While we deplore the necessity of forcing or coaxing enlightenment on a certain percentage of the profession, we commend the methods of organization work and recommend that it be continued until all eligible physicians are enrolled in the cause of scientific medicine The Cooperating Medical Advertising Bureau should be continued The work of the Propaganda Department is so well understood that to mention it is to endorse its work and the same is true of the Council on Pharmacy and Chemistry We advise that such books as 'Useful Drugs" be more prominently advertised in The Journal with a view of increasing their circulation among the members of the profession The Council in the opinion of your committee, should keep the profession in close touch with the dangers as well as with the possibilities and limitations of vaccine therapy and of radium The Journal should continue and increase its efforts to enlighten the profession on the clinical action of drugs and to show the members the fallacy and the wickedness not to say the unscientific methods which they use in their cases when guided by commercial literature in prescribing

The memorial to Congress regarding proprietary medicines is referred back to the board without recommendation which means that your committee has little confidence in the success of the effort

We congratulate the profession that its business has been so well handled that it possesses means to defend itself against attacks of unholy and of vicious interests The financial success of "patent medicine," for so many years, is a sad commentary on the lack of medical intelligence or want of medical enlightenment of the people We hope that we may win in the contest now before the court and thus vindicate the efforts of the American Medical Association in its efforts to conserve the health and the dollars of the people The good work should go on whether we win or lose

Report of the Council on Scientific Assembly

Your committee recommends the adoption of the recommendations of the council so far as they relate to the Section on Hospitals that is that the section be discontinued but it seems to us wise that this subject be discussed from time to time by assigning to it one or more units at the discretion of the Council on Scientific Assembly in some other section

We endorse the recommendation that the term "unit" be used as a basis for classifying the sections covering the maximum number of papers to be read before them The motion offered by Dr Murray of New York, "that the Section on Stomatology shall be modified by adding thereto Gastro-Enterology and Proctology and that the section as reconstituted be accorded three units," is recommended back to the council for action

While the recommendation made by the council that Sec. 3 Chapter XI, of the By-Laws should really go to the Committee for Amendment to the Constitution and By-Laws the rest of the recommendation, with the concurrence of the above committee is recommended for adoption. The council should be granted the four requests it makes (1) adoption of the definition of the word unit', (2) the tentative adoption of the number of units assigned to the sections, (3) the discontinuance of the Section on Hospitals and (4) the modification of the By-Laws regarding orations

We endorse the recommendations of President Vander Veer covering the subject of preparedness and your committee cannot too strongly emphasize the importance of the cooperation of the American Medical Association with the Congress of American Physicians and Surgeons the Clinical Congress of Surgeons of North America, and the American College of Surgeons and other organizations active in this movement for medical preparedness under the direction of the heads of the military services of the United States "The Albany Idea seems to your committee practical and worthy of consideration or adoption

We unreservedly endorse the recommendation of the Red Cross Committee

The following communication from the Women's Christian Temperance Union is recommended for reference to the Council on Health and Public Instruction

Rest Cottage Evanston Ill,
June 3, 1916

To the House of Delegates of the American Medical Association
Detroit Michigan

Dear Sirs —In view of the increasing desire on the part of the nations of the world for relief from the evil effects of alcoholic liquors on society and in view of the fact that all the warring nations of Europe have found that liquor drinking must be curbed because of its interference with health efficiency and safety, we, representing 400 000 women members of the National Women's Christian Temperance Union respectfully request that your honorable body give expression at this annual meeting of the American Medical Association to such a warning against alcoholic liquors as shall strengthen the hands of boards of health and temperance organizations now combating the liquor evil

One of the chief causes of the alcohol habit is the ignorance of the mass of the people concerning the real nature of alcohol They have been taught that alcoholic liquors give health and strength, that they are tonic and remedial The brewing and whisky trades advertise that their products are foods and tonics and aids to digestion, and that they are endorsed and recommended by physicians the world over The medical profession owes it to itself and to the public to offset this dangerous and misleading advertising by a statement of the truth

The medical society of Russia at its meeting in 1915 issued a notable document against alcohol a copy of which is appended for the information of any of your honorable body who may not have seen it Your petitioners hope for as strong and helpful an expression from the great American Medical Association as that emanating from your Russian confreres

Yours sincerely
Anna A Gordon
President
Martha M Allen
Supt Dept of Medical Temperance

Respectfully submitted

A R Mitchell,
Ben R McClellan,
E R. Stitt

Dr C H. Good, Indiana, moved that the report be adopted Seconded

Dr Dwight H Murray, New York, moved as a substitute that that section of the Report of the Reference Committee on Reports of Officers, concerning the Section on Stomatology, be first considered, and that there be substituted for the recommendation of the Reference Committee the following namely, the subjects of Gastro-Enterology and Proctology be added to the subject of Stomatology, and that a Section on Stomatology, Gastro-Enterology and Proctology be constituted and substituted for the present Section on Stomatology

Seconded by Dr Randolph Winslow, Maryland

Dr Dwight H Murray, New York, moved that the House go into a Committee of the Whole

Seconded and carried

The House went into a Committee of the Whole

When the House reconvened, a vote was taken on the substitute motion of Dr Murray and it was declared adopted

Dr Arthur T McCormack, Kentucky, then moved that the report of the Reference Committee on Reports of Officers be adopted as amended

Seconded and unanimously carried

Report of Reference Committee on Medical Education

Dr L W Littig Iowa, chairman, presented the report of the Reference Committee on Medical Education as follows

Your committee has carefully reviewed the report of the Council on Medical Education and begs to report as follows

Your committee endorses the recommendation of the Council that a year's internship in an approved hospital be made an essential part of a medical curriculum, and that state licensing boards be urged to make such hospital year a legal requirement for the license to practice medicine in their respective states, and that such action be taken at the earliest practicable date With this object in view, it is further recommended that legal authority be obtained by state licensing boards to inspect the hospitals in their respective states to establish rules governing their conduct, and to list as approved only those complying with such rules It is suggested that the Council cooperate with state licensing boards and other agencies interested in this effort to improve existing conditions in hospitals in this country

Your committee recommends that after Jan 1 1918 no medical college be retained in Class A by the Council on Medical Education that does not require for admission at least two years of work in a college of arts sciences approved by the Council, or, in lieu thereof, have an education equivalent to the above, as demonstrated by a fitting and properly conducted examination, approved by the Council Your committee believes that this standard should be adopted at this time so as to bring medical education into better coordination with general education in this country Nevertheless, it should be understood that this represents the highest requirement of preliminary education that should be legally established in this country Furthermore, it is recommended that the Council cooperate with the National Educational Association, with the North, Central and the Southern Associations of Colleges and Secondary Schools, and with other educational agencies, in the efforts now being made to save one or two years of the student's time during the period of elementary and high school education This saving will enable students to graduate from the medical school at an average age of 24 or 25 years

Your committee recommends that the Council cooperate with educational organizations, state medical societies, state licensing boards and any other interested organizations, in an effort to secure laws regulating the chartering of educational institutions, so that only those having adequate endowment, a reasonable equipment and an ample number of skilled teachers be given authority to confer degrees, or educational qualifications of any kind

Your committee recommends that all legislation regulating the practice of the healing art, by whatever method or system, require the same educational standard as that with which physicians have to comply, and that this educational standard be the minimum that will guarantee the ability to differentiate between normal and abnormal conditions in the human body, to differentiate between and to recognize diseases and intelligently to apply treatment

The Council has done well to call attention to the discrimination by certain Canadian provinces against the medical schools of this country The adjustment of this matter has been properly referred to the state licensing boards, and an amicable adjustment of the difficulty is hoped for

Your committee recommends that the Council secure such information as it can regarding all medical colleges abroad, and that it prepare a list of such institutions as it deems worthy of recognition, and submit such list to the state licensing boards of this country

Your committee emphasizes the Council's recommendations that the National Board of Medical Examiners as it is now constituted be heartily approved Such a board is in position to establish a medical qualification which may eventually not only be recognized by the state licensing boards of this country, but may also be looked on by medical authorities abroad as a qualification of unquestioned worth This board is in position to develop methods of examination which may lead to their adoption by the various state licensing boards, or at least will be worthy of their most careful study and emulation The qualification furnished by this board will also be a stimulus to ambitious and aspiring medical students, as its possession will be both an honor and an asset

In conclusion, the committee wishes to congratulate the Council on Medical Education, and especially its distinguished chairman, for the splendid results obtained by its untiring and unselfish efforts

Respectfully submitted

L W LITTIG, *Chairman*,
W H SEEMANN,
HUGH N MACKECHNIE,
A H LEVINGS,
WILLIAM S LALOR

Dr E J McKnight, Connecticut, moved that the report be adopted

Seconded and carried

New Business

Dr John F Anderson, New Jersey, delegate from the Section on Pharmacology and Therapeutics, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health

WHEREAS, Methods for the bio assay of certain drugs are to be included in the U S P IX, although, with the exception of that for solution of hypophysis they are optional, and

WHEREAS, It is important that uniform standards be employed for such assays, therefore, be it

Resolved, That the Section on Pharmacology and Therapeutics urgently recommends the House of Delegates to request the Secretary of the Treasury to authorize the United States Public Health Service to prepare and distribute for use in the bio assay of cannabis, aconite, digitalis, strophanthus, squill, suprarenal gland and hypophysis, the standards as recommended in U S P IX

(The foregoing resolution was adopted by the Section on Pharmacology and Therapeutics, June 13, 1916)

Mr H M McClanahan, Nebraska, delegate from the Section on Diseases of Children, offered the following preamble and resolution

WHEREAS, The problems of disease in children are peculiar and of far reaching importance, therefore be it

Resolved, That the Section on Diseases of Children requests that the House of Delegates authorize and establish a Council on Infant Morbidity and Mortality

The resolution was referred to the Reference Committee on Hygiene and Public Health

Dr Jere L Crook, Tennessee, informed the House of Delegates that Dr John B Murphy, a Past President of the Association, was ill at Atlantic City, and moved that the House of Delegates direct that a telegram be sent to Dr Murphy expressing sympathy and best wishes for a speedy recovery

Seconded and carried

Dr Stewart J Roberts, Georgia, moved that Dr George H Simmons, Illinois, editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, be asked to address the House of Delegates at this time

Seconded and carried

Dr Simmons thanked the members of the House of Delegates for the compliment implied in the action taken, and stated he did not wish to occupy the time of the House of Delegates at this juncture

Dr Arthur T McCormack, Kentucky, moved that the Reference Committee on Legislation and Political Action be instructed to bring before the House of Delegates, at the next meeting, a resolution endorsing pending legislation, giving greater scope and opportunities to the United States Public Health Service, and in maintaining the splendid work that is being done by that service

Seconded and carried

Dr Charles J Whalen, Illinois, moved that the House of Delegates adjourn until 2 p m Thursday

Accordingly, the House of Delegates thereupon adjourned

Third Meeting—Thursday Afternoon, June 15

The House of Delegates met and was called to order at 2 10 p m by the President

The minutes of the previous meeting were read and approved

Dr F C Warnshuis, Michigan, rose to a question of personal privilege and presented the following communication

To the House of Delegates, American Medical Association

Gentlemen —Having learned that the premature prediction in the *News* that Dr Charles H Mayo would be elected president of your association might lead to criticism of Dr Mayo and his friends, I wish to say that the story printed in today's paper did not come from either the doctor or any of his friends

The story was obtained by a *News* reporter independently of any members of your Association, and he was not aware that any impropriety was being committed in the publication of this report

HENRY A MONTGOMERY,
City Editor, Detroit *News*

Dr Warnshuis stated that he desired to advise the House that the unfortunate premature announcement, in the local newspapers, of the result of the election to be held this afternoon, was given publicity without the knowledge or consent of any member of the local or state profession, or of Dr Charles H Mayo himself, and that he desired to make this explanation in order that the members of the House might be fully informed, and that they might choose a President-Elect without bias which might be occasioned by this premature publication if this explanation was not made

The secretary called the roll, and 128 delegates responded

Election of Officers

The next order of business being the election of officers, the House proceeded with an election, which resulted in the choice of the following

President—CHARLES H MAYO Rochester, Minn

First Vice President—L F BARKER, Baltimore

Second Vice President—JOHN LFEMING Chicago

Third Vice President—J HENRY CARSTENS, Detroit

Fourth Vice President—GEORGE F KEIPER, Lafayette, Ind

Secretary—ALEXANDER R CRAIG, Chicago

Treasurer—WILLIAM ALLEN PUSEY Chicago

Chairman of the House of Delegates—HUBERT WORK, Pueblo, Colo

Vice Chairman of the House of Delegates—DWIGHT H MURRAY, Syracuse, N Y

Members of the Board of Trustees—A R MITCHELL, Lincoln Neb OSCAR DOWLING Shreveport La, E J MCKNIGHT, Hartford Conn.

Judicial Council—J N BLACK Pueblo, Colo

Council on Health and Public Instruction—FRANK BILLINGS Chicago

Council on Medical Education—WILLIAM D HAGGARD, Nashville, Tenn

Council on Scientific Assembly—J SHELTON HORSLEY, Richmond Va

The secretary presented a list of applicants for Associate Fellowship endorsed by the Judicial Council and the officers of the Sections on Stomatology, on Pathology and Physiology and on Pharmacology and Therapeutics

Dr Wendell C Phillips, New York, moved that the secretary be authorized to cast the ballot of the House in each instance in which the applicant is not eligible for membership in the state association of the state in which he resides, and provided no objection to the applicant is filed by the officers of the said state association.

Seconded and carried

Report of Committee on Transportation and Place of Session

Dr J R Pennington, Illinois presented the report of the Committee on Transportation and Place of Session, as follows

Invitations have been received from Atlantic City, N J Chicago Columbus Ohio and New York City two of which—Chicago and Columbus—were from the commercial associations only and two—those from Atlantic City and from New York City—were from the medical societies of these respective districts supported by the convention bureaus

After carefully considering and fully discussing the advantages of both Atlantic City and New York City for the next annual session of the Association your committee deems it best to recommend to the House of Delegates that both New York City and Atlantic City be placed in nomination, and that a ballot be taken

By order of the committee

J RAWSON PENNINGTON,
Chairman

On motion, duly seconded and carried the report was adopted

Before a ballot was taken, the advantages of the two places in nomination were discussed by Drs Floyd M Crandall F E. Sandern, Wendell C. Phillips and Dwight H Murray all of New York speaking for New York City, and Drs Emery Marvel New Jersey and Randolph Winslow, Maryland speaking for Atlantic City

A ballot was then taken which resulted in the choice of New York City as the place of meeting for the 1917 session

On motion duly seconded and carried, the choice of New York City was made unanimous

Report of the Reference Committee on Legislation and Political Action

Dr E J Goodwin Missouri chairman presented the report of the Reference Committee on Legislation and Political Action, as follows

To your Reference Committee on Legislation and Political Action has been referred the following

Dr Arthur T McCormack, Kentucky moved that the Reference Committee on Legislation and Political Action be instructed to bring before the House of Delegates at the next meeting a resolution endorsing pending legislation giving greater scope and opportunities to the United States Public Health Service and in maintaining the splendid work that is being done by that service

Seconded and carried

Your reference committee has carefully considered the purpose of this motion and takes pleasure in recommending that the following resolution be adopted

Resolved, That the House of Delegates of the American Medical Association in annual session assembled, endorses pending legislation in the Congress that will give greater scope and opportunities to the United States Public Health Service for protecting the health and lives of the people and maintaining the high standard of efficiency already established by that service.

E J GOODWIN, Chairman
FREDERICK L VAN SICKLE,
H R. MCGRAW,
CHARLES W HANNAFORD,
C P MERIWETHER.

It was moved that the report be adopted.

Seconded and carried

Report of Reference Committee on Hygiene and Public Health

Dr Arthur T McCormack, Kentucky, chairman, presented the report of the Reference Committee on Hygiene and Public Health as follows

Your Reference Committee on Hygiene and Public Health had submitted to it two resolutions, the one by the delegate from the Section on Diseases of Children requesting that the House of Delegates authorize and establish a Council on Infant Morbidity and Mortality Your committee recommends that this suggestion be not concurred in The second, a resolution presented by the delegate from the Section on Pharmacology and Therapeutics, requesting that the House of Delegates memorialize the secretary of the treasury, asking that the United States Public Health Service be authorized to prepare and distribute for use in the bio-assay of certain drugs the standards as recommended in the Ninth U S P Your committee recommends that the president and secretary of the association request the secretary of the treasury to take this action

Signed by order of the committee

A. T MCCORMACK,
Chairman

It was moved that the report be adopted

Seconded and carried

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr Floyd M Crandall, New York, chairman, presented the report of the Reference Committee on Amendments to the Constitution and By-Laws, as follows

The following amendment was proposed at the meeting of the House of Delegates held Tuesday June 13

Amend Chapter VII, Section 3 Paragraph (*c*) of the By-Laws by eliminating the words 'Committee on Transportation and Place of Meeting"

To bring the By-Laws into harmony, should this amendment be adopted a further amendment was proposed to Chapter VII, Section 6 of the By-Laws by eliminating the section

Also that the sections following be renumbered

The committee approves these amendments and advises their adoption

The following amendment was proposed at a meeting of the House of Delegates, held Tuesday, June 13

To amend Chapter VIII Section 6, of the By-Laws by adding the words "no person can become an Associate Fellow who can be a member of the American Medical Association in the regular way"

The committee recommends that the subject of Associate Fellowship be referred to the Judicial Council for report next year

The Committee on Amendments to the Constitution and By-Laws directs me as chairman to present the following

Moved That the secretary of the Association be empowered to edit the amendments proposed and adopted at this session and to make such changes in numbering and arrangement as may be necessary to bring them into harmony with the Constitution and By Laws as they now exist, but he is not empowered to alter the sense or meaning of any amendment adopted

This report was considered section by section, and on several motions, duly seconded and carried, each section was adopted

Dr Arthur T McCormack, Kentucky, moved the adoption of the report as a whole

Seconded and carried

Dr W T Williamson, Oregon, moved that the House of Delegates extend a cordial vote of thanks to the Wayne County Medical Society, the citizens of Detroit, especially those who took part in the opening meeting, and those who extended courtesies and entertainment to the American Medical Association

Seconded by Dr Thomas S Cullen, Maryland, and unanimously carried by rising vote

Supplementary Report of the Council on Scientific Assembly

The secretary presented a supplementary report from the Council on Scientific Assembly, which, on motion duly seconded and carried, was adopted

Your Council on Scientific Assembly offers this as a supplementary report and recommends that in place of combining Gastro-Enterology and Proctology with Stomatology, the latter section be reconstituted, and that a Section on Gastro-Enterology and Proctology be established This will not increase the number of sections, since the Section on Hospitals has now been discontinued

Respectfully submitted

J Shelton Horsley,
A R Craig,
G H Simmons

The secretary asked unanimous consent, which was granted, and presented a resolution from the Section on Preventive Medicine and Public Health, with the request that this communication be referred to the Council on Health and Public Instruction

On motion, duly seconded and carried, the communication was so referred

The resolution is as follows

Resolved, That the Section on Preventive Medicine and Public Health recommends to the House of Delegates that the Council on Health and Public Instruction be instructed to consider the question of a Public Health Exhibit in connection with the next annual session

The secretary, with the unanimous consent of the House, read the following telegram addressed to the President of the Association, which, on motion duly seconded and carried, was spread on the record

There will be one Field Hospital and one Ambulance Company United States Army at Citizens Military Training Camp, Fort Benjamin Harrison, Indianapolis, Indiana, for instructing doctors and medical students in field hospital and sanitation work, four camps of fifteen days' duration each will be held, commencing with July 5, cost one dollar per day, in addition to cost of uniform Urgently recommend attendance these camps every man interested in adequate national defense Hope your Association will endorse this movement Army Surgeon at Fort Wayne Detroit will furnish circulars

William Stephenson
Colonel Medical Corps Department Surgeon

Dr John Ridlon, Illinois, delegate from the Section on Orthopedic Surgery, asked unanimous consent, which was granted, to present two communications from this section and have them referred to the proper committees These communications are as follows

The Orthopedic Section having received a communication suggesting the advisability of reducing the number of sessions as well as the number of papers of this section, adopted the following resolution, unanimously

The experience of the Orthopedic Section of the American Medical Association at both the Detroit Session and those which have gone before has shown that there is a great and growing interest in the work which it is doing It is of the highest importance to the cause of the crippled and deformed that this work be popularized

The average attendance at the Detroit session has been close to 100, the papers have without exception been of practical interest and the discussions most instructive

The Orthopedic Section, therefore, asks that no action be taken by the House of Delegates which will in any way reduce the maximum number of papers and of sessions as set forth by the rules at present in effect

The second resolution follows

Whereas, The crippled and deformed children of the nation constitute a class among whom there are many neglected, dependents and defective, only five states and a few private institutions providing at all adequate care, and

Whereas, The work that is being done in their behalf proves that from 40 to 50 per cent of them, if taken in time, may be wholly cured and made self supporting, independent citizens while an additional 25 per cent may be made self supporting, and

Whereas, *It* is estimated that there are at least 300,000 crippled children in the United States, with proper institutional provisions for less than 3,000, therefore,

This association urges that the various state superintendents of education take the proper steps to take a census of crippled and deformed children under 18 years of age, with a view to ascertaining their number in order to provide proper hospital schools for their care and conservation

Dr Arthur T McCormack, Kentucky, moved that the first communication be referred to the Council on Scientific Assembly, and the second one to the Council on Health and Public Instruction with power to act Seconded and carried

Dr B R McClellan, Ohio, asked unanimous consent, which was granted, and presented the following

The delegates to the American Medical Association from the Ohio State Medical Association were instructed at the last annual meeting in Cleveland to request the American Medical Association to refer to the Council on Health and Public Instruction a resolution requesting some action on a uniform effort for the formation of reserve surgical corps to cooperate with the medical departments of the United States Army and Navy We, therefore, present the following resolution

"That the president appoint a committee to confer with the medical departments of the United States Army and Navy to draw up a uniform plan for organizing in the various states reserve medical corps"

On motion, duly seconded and carried, the communication was received and referred as requested

It was moved that the President of the Association be authorized to appoint all committees which have been authorized at this annual session of the House, and also the chairman, vice chairman, secretary and executive committee of the new section constituted this afternoon

Seconded and carried

Dr Milton Board, Kentucky, presented the following which, on motion, duly seconded and carried, was adopted

A Note on the Death of Dr Favill to be Spread on the Minutes of the House of Delegates

The American Medical Association has suffered in the past year a serious loss by the death of Dr Henry Baird Favill Dr Favill had been chairman of the Council on Health and Public Instruction since its establishment in 1910 He was a physician who had clear insight into the significance and growing importance of the relations of the medical profession to the public In many different ways, he was responsive to the call to human service, not only for individuals but also for organizations for social betterment

Dr Favill's keen vision for things of fundamental value, his constructive idealism, which was made efficient by a large experience with men and affairs and by an ingenious practicality, his wide ranging interest in whatever might benefit mankind, his inspiring leadership and his tireless energy were nowhere else more effectively manifested than throughout his work in the Council on Health and Public Instruction

The House of Delegates of the American Medical Association hereby registers its grateful appreciation of the beneficent and lasting service to his fellow men which Dr Favill rendered by his activity both in the medical profession and in the community at large, and its feeling of poignant regret that a life so overflowing with unselfish devotion to high aims should have been so prematurely ended

The following extract from an appreciation of Dr Favill, written by Dr Lenna Meanes, chairman of the subcommittee on women's and children's welfare, and published in the *Women's Medical Journal* well shows the esteem in which Dr Favill was held by those associated with him in council work

Dr Henry Baird Favill was a man of unusual power and leadership Over and again, we have read that tribute to his memory in the weeks since his death, and the tribute has come from sources as varied as his interests were Wherever he allied himself, his keen sense of discrimination, together with his ideals of justice, compelled the immediate recognition of that power Perhaps in no other place was his

the Indians infested this part of the country Then the French came along and Pontchartrain and Cadillac founded the city of Detroit in 1701 The name Detroit is from the French *detroit*, meaning the strait, and was so called because of its situation on the narrow strait connecting Lake St Clair with Lake Erie. The history of Detroit is closely interwoven with that of the whole Northwest, which began as early as Canada and Virginia

Though "the place called Detroit" had been known to explorers for many years, it was not until the New England and New York coasts were inhabited that it began to be of any importance From the rough maps it was seen to be the easiest passage to the Mississippi Valley and Louisiana, and Cadillac, then commandant at Michilimackinac, first conceived the idea of a post at Detroit and prepared plans for a settlement. July 24 1701, he arrived with his 13-year-old son, a nephew, Surgeon Henri Belisle, Capt Alphonse de Tonty Lieutenants Dugue and Chacornacle, Father Vaillant, a Jesuit missionary, Father De L'Halle a Recollect, chaplain of the expedition, fifty soldiers and fifty Canadian traders and artisans with equipment for settling

For over 100 years after the first Frenchman came it was under the dominion of France, and during sixty years of this time, under a French governor From 1760 to 1796 it was controlled by the British The fort was commanded by English officers, and Scotch merchants began to change the character of the place After thirty-six years of English rule the American flag floated over the fort and the New England influence came The importance of the post brought as commanders the most noted officers, and some of the leading eastern families made Detroit their home Again in 1812, the English flag waved over the fort for thirteen months to be replaced by the stars and stripes after Perry's victory in the Battle of Lake Erie

We were born of romance of war and fire, and out of that has come the splendid citizenship such as you see today The class of people here are rugged and hearty, brave and courageous, until I think we now have what we may call a wonderful city You may think that we are only an automobile city Well that is true because Detroit makes more automobiles than any city in the world We were on a solid financial basis long before the automobile came We lead the world in many manufacturing products, like stoves, and in pharmaceutical preparations we are second to none in the world

We have the vast factories which I hope, you will be delighted with and take great pleasure in going through and seeing how automobiles are turned out, one every minute starting at the beginning with nothing at all, and passing along down to the end of the factory until you see the men turn out a complete automobile that runs under its own power These vast factories are controlled by men that are strong and sturdy because no industry, my friends, can be greater than its source It cannot be greater than what is behind it namely the men and unless these men are people of character people of integrity people of broad spirit and great souls that industry is bound to fail absolutely

I am personally acquainted with all the gasoline kings of Detroit and I am glad to say to you that they are men of the highest integrity men who are looking and working for the betterment of the world because they do not look on the men who stand at the machinery and do the work as their serfs and slaves but they look on them as their fellow men—men who deserve and are receiving an honest living wage in order that they may live and grow up not as slaves but as good American citizens They are paid enough money so that they can dress their wives and children in proper style and be self-respecting The children are sent to school and are taught the constitution of Michigan and the constitution of the United States They teach them the English language and these children grow up to honor and respect the government, the law and the flag under which they live (Applause.) Now my friends, that is true citizenship That is preparedness which the governor talked about because you are making fundamentally stalwart men—men who not only become first class citizens but also self-respecting, moral healthy people All this is being done by the manufacturers here in the city of Detroit and they are well worthy of the progress and of all the success they have attained I want you to go among them I want you to enjoy yourselves Leave dull care at home Do not think about the patients you have left at home sick in bed They will all get well while you are away (Laughter) Give them a chance. Do not worry about them because it is human nature if you have fixed them all right for them to think they will be all right You give them advice how to live and how to keep their health, but they will go right straight back and do the very things that you told them not to do, and you will be on the job and you will not lose a cent (Laughter)

The working men of this city, after being in hot places during the week in the factories, working hard, on Saturday and Sunday with their wives and children, take their little baskets and go to the parks where they can all enjoy themselves to their hearts' content For that reason, this is one of the greatest labor markets in the world We very rarely have any trouble with labor of any kind in this city, especially any trouble with honest labor Once in a while, an agitator thinks he has got to do something

The mayor told me to tell you that he had instructed the police department not to interfere with anything you do He said that boys will be boys, and that when they get away from home and have a good time, they are too level-headed to do anything which is indiscreet.

My friends members of the American Medical Association, I thrice welcome you to the beautiful city of Detroit and I hope you will enjoy yourselves immensely (Loud applause)

ADDRESS OF WELCOME BY PRESIDENT OF THE MICHIGAN STATE MEDICAL SOCIETY

Dr A. W Hornbogen, president of the Michigan State Medical Society, delivered the following address

Mr President, Fellow Members of the American Medical Association Ladies and Gentlemen I esteem it an honor that it has fallen to me as president of the Michigan State Medical Society, to welcome you to this city

Sixty years ago, in 1856, you met for the first time on Michigan soil Your president, on that occasion, was Dr Zina Pitcher of Detroit It is not probable that any member here present was in attendance at that meeting

Eighteen years later, you honored our state with your presence, Detroit was again chosen as the place of meeting, and Dr Joseph Toner of Washington, D C, was your president.

In 1892 Detroit was once more your meeting place, and Dr Henry O Marcy of Boston, one of the renowned surgeons of his day, was your presiding officer

Twenty-four years have elapsed since your last visit, and I can assure you that after the close of this meeting, you, as members of the various state medical societies, remembering with gladness the royal welcome and entertainment tendered you by the medical men of Wayne County will not forget to instruct your delegates to the American Medical Association not to have a quarter of a century elapse before coming to see us again

We, the members of the Michigan State Medical Society, as proud citizens of one of the fairest states in the Union, and as brothers of a common profession, extend to you a most hearty welcome (Applause)

In closing, I wish to refer briefly to the herculean work accomplished by one of the members of our state medical society, Dr Beverly D Harison He has probably done more for the medical profession in the United States, and the people of this country, than almost any other man present today When you stop to consider that in June, 1901 the National Confederation of Medical Examining and Licensing Boards passed a resolution that medical reciprocity was an impossible proposition you will find that in spite of all the pessimistic forecasts Dr Harison, at the instigation of the Michigan State Board of Registration, commenced in the same year his arduous work, which led in January, 1902, to the foundation of the American Federation of Reciprocating, Examining and Licensing Medical Boards in Chicago

This federation from the membership standpoint was certainly a small one, but it has grown until now it is responsible for the present status of reciprocity throughout the United States and includes four fifths of the states of the Union (Applause.)

Dr Vander Veer, in introducing and installing the President, Dr Rupert Blue, said Faithful in all things, successful in every mission given to him by this great United States government, I take great pleasure in introducing to you Dr Rupert Blue, Surgeon-General of the United States Public Health Service, as your President (Applause)

President Blue then delivered his address, on Some of the Larger Problems of the Medical Profession,' which was published in The Journal, June 17, 1916 p 1899

Adjourned

MINUTES OF THE SECTIONS

SECTION ON PRACTICE OF MEDICINE

First Day, June 13—Afternoon

The meeting was called to order by the chairman, Dr Roger S Morris, Cincinnati

Dr C F Hoover, Cleveland, was appointed on the Executive Committee in the absence of Dr Charles Lyman Greene, St Paul

Dr Walter V Brem, Los Angeles, read a paper on "Blood Transfusion, With Special Reference to Blood Grouping" Discussed by Drs Richard Lewisohn, New York, George R Minot, Boston, F G Novy, Ann Arbor, Mich, A Jacobi, New York, and Walter V Brem, Los Angeles

Drs Henry Sewall, William C Mitchell and Cuthbert Powell, Denver, presented a paper on "Preliminary Observations on the Apparently Immunizing Behavior of the Mixed Serums of Immune and Hypersensitive Guinea-Pigs" Discussed by Drs F G Novy, Ann Arbor, Mich, Samuel J Meltzer, New York, and Henry Sewall, Denver

Dr Downey L Harris, St Louis, read a paper on "Comparative Results in Antirabic Treatment with the Pasteur Method and with Desiccated Virus" Discussed by Drs Samuel J Meltzer, New York, William W Tompkins, Charleston, W Va, and Robert A Peers, Colfax, Calif

Wednesday, June 14—Morning

The following were appointed as a nominating committee Drs Nellis B Foster, New York, Lawrence Litchfield, Pittsburgh, and Walter V Brem, Los Angeles

The following papers were read as a symposium on "Tests for Renal Function"

Dr Nellis B Foster, New York "A Consideration of Types of Uremia"

Drs Arthur F Chace, New York, and Victor C Myers, Albany, N Y "The Value of Recent Laboratory Tests in the Diagnosis and Treatment of Nephritis, with Special Reference to the Chemical Examination of the Blood"

Drs Herman O Mosenthal and D Sclater Lewis, Baltimore "A Comparative Study of Tests for Renal Function"

These three papers were discussed by Drs Henry A Christian, Boston, Samuel J Meltzer, New York, L F Barker, Baltimore, A W Hewlett, Ann Arbor, Mich, H J Lehnhoff, Lincoln, Neb, Nellis B Foster, New York, Arthur F Chace, New York, and Herman O Mosenthal, Baltimore

Dr Edward C Rosenow, Rochester, Minn, read a paper on "Lesions of the Nervous System Following Intravenous Injection of Bacteria" Discussed by Drs Frank Billings, Chicago, Ernest Zueblin, Baltimore, Samuel J Meltzer, New York, G Canby Robinson, St Louis, Henry A Christian, Boston, and Edward C Rosenow, Rochester, Minn

Dr Samuel Robinson, Rochester, Minn, read a paper on 'Thoracic Disease—The Status of Surgical Therapy" Discussed by Drs Willy Meyer, New York, F T Lord, Boston, Samuel J Meltzer, New York, and Samuel Robinson, Rochester, Minn

Wednesday, June 14—Afternoon

A joint meeting was held with the Section on Surgery, General and Abdominal For a report of the proceedings, see the minutes of that section

Thursday, June 15—Morning

The following officers were elected chairman, Dr Henry A Christian, Boston, vice chairman, Dr Douglas Vanderhoof, Richmond, Va, secretary, Dr James S McLester, Birmingham, Ala, delegate, Dr Samuel J Meltzer, New York, alternate, Dr Herbert C Moffitt, San Francisco

Drs Thomas McCrae and Elmer H Funk, Philadelphia, presented a paper on "Localized Bronchiectasis Involving the Upper Portions of the Lung, with Report of Four Cases (Necropsy)" Discussed by Drs F T Lord, Boston, Thomas McCrae, Philadelphia, and Elmer H Funk, Philadelphia

Dr John E Greiwe, Cincinnati, read a paper on "Premature Ventricular Systoles and Their Clinical Significance" Discussed by Dr Charles F Hoover, Cleveland, and Walter J Wilson, Detroit

The following papers were read as a symposium on "Disturbances of Cardiac Mechanism"

Dr Albion W Hewlett, Ann Arbor, Mich "The Significance of Pulse Form"

Dr G Canby Robinson, St Louis "The Relation of Changes in the Form of the Electrocardiogram to Functional Derangements of the Heart Muscle"

Dr Francis W Peabody, Boston "Some Factors in the Production of Cardiac Dyspnea"

Dr Augustus W Crane, Kalamazoo, Mich "Roentgenograms Polygraphic Strip Tracings of Heart Chambers by the Roentgen Ray"

These four papers were discussed by Drs Frank N Wilson, Ann Arbor, Mich, S Marx White, Minneapolis, Philip S Roy, Washington, D C, Hugo A Freund, Detroit, F T Lord, Boston, Albion W Hewlett, Ann Arbor, Mich, and John E Greiwe, Cincinnati

Drs Walter Hamburger, Harry Ginsburg and Isadore Tumpowsky, Chicago, presented a paper on "Mechanism of Hunger Pain in Chronic Ulcer" No discussion

Dr Willard J Stone, Toledo, Ohio, read a paper on "Further Experiences with Carbohydrate Restriction in the Treatment of Hyperchlorhydria and Ulcer" Discussed by Drs Samuel J Meltzer, New York, M H Fussell, Philadelphia, Anthony Bassler, New York, J W Draper, New York, Isadore Tumpowsky, Chicago, and Willard J Stone, Toledo

Dr Cabot Lull, Birmingham, Ala, read a paper on "Syphilis as a Probable Factor in Vague Stomach Disorders" No discussion

Dr H L McNeil, Galveston, Texas, read a paper on "Syphilis in the Southern Negro as Determined by One Thousand Wassermann and Luetin Reactions Done on Hospital Patients" Discussed by Drs Frank Smithies, Chicago, and Fenton B Turck, New York.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

Tuesday, June 13—Afternoon

The meeting was called to order at 2 05 by the chairman, Dr E Wyllys Andrews, Chicago

Dr Andrews then read the chairman's address, entitled "The Relation of Practical Surgery to the Pure Sciences" No discussion

Dr George W Crile, Cleveland, read a paper on "Practical Results of Newer Methods in Surgery of the Stomach and Intestines" Discussed by Drs A J Ochsner, Chicago, R C Coffey, Portland, Ore, Henry O Marcy, Boston, John B Deaver, Philadelphia, Alfred A Strauss, Chicago, and G W Crile, Cleveland

Dr John A Wyeth, New York, read a paper on "Some Observations on the Teaching of the Surgeon" Discussed by Drs A D Bevan, Chicago, John D Milligan, Pittsburgh, Thomas A Stoddard, Pueblo, Colo, H O Marcy, Boston, and John A Wyeth, New York

Dr A Bennett Cooke, Los Angeles, read a paper on "Nitrous Oxid-Oxygen Anesthesia in Major Surgery" Discussed by Drs W I Terry, San Francisco, L M Gaines, Atlanta, Ga, and Mr C K Teter, Cleveland

Dr Charles N Dowd, New York, read a paper on "Tuberculosis of the Cervical Lymphatics" Discussed by Drs John F Golden, Chicago, Robert T Morris, New York, W L Ladd, Boston, Willy Meyer, New York, and C N Dowd, New York.

Dr Emil G Beck, Chicago, read a paper on "Incorrect Technic as a Cause of Failure in the Application of Bismuth Paste in Chronic Suppurative Sinuses and Empyema" Discussed by Drs A. J Ochsner, Chicago, and Emil G Beck, Chicago

Wednesday, June 14—Morning

Dr C A Elsberg New York, read a paper on "Some Technical Features of Spinal Surgery, with Report of Results in 150 Spinal Operations" Discussed by Drs E Sachs, St Louis, and C A Elsberg, New York

Dr Arthur A. Law, Minneapolis, read a paper on 'Surgery of the Brachial Plexus" Discussed by Drs Dean D Lewis, Chicago, and Arthur A Law, Minneapolis

Dr Carl B Davis, Chicago, read a paper on "Free Transplantation of the Omentum Subcutaneously and Within the Abdomen' Discussed by Drs Alfred A Strauss, Chicago, John Staige Davis, Baltimore and A T Mann, Minneapolis

Dr J Shelton Horsley, Richmond, Va, read a paper on Operative Treatment for Threatened Gangrene of the Foot, with Special Reference to Reversal of the Circulation" Discussed by Drs Dewitt Stetten, New York, Charles Goodman, New York, Nathaniel Ginsburg, Philadelphia, Carl Beck, Chicago, G M. Dorrance Philadelphia, E Laplace Philadelphia, *J F Corbett, Minneapolis, and J Shelton Horsley,* Richmond, Va.

Dr Charles C Green, Houston, Texas, read a paper on "Stab Wounds of the Chest Involving the Diaphragm with Diaphragmatic Hernia." Discussed by Drs J E. Moore, Minneapolis, and Charles C Green, Houston, Texas

Wednesday, June 15—Afternoon

A joint meeting was held with the Section on Practice of Medicine

The meeting was called to order by Dr Roger S Morris Cincinnati

The following papers were read as a symposium on the Spleen."

Dr George R Minot, Boston, and Dr Roger I Lee, Boston 'The Immediate Effects of Splenectomy in Pernicious Anemia"

Dr E. B Krumbhaar, Philadelphia "Late Results of Splenectomy in Pernicious Anemia'

Dr Joseph L Miller Chicago "Splenectomy in Chronic Anemia, Exclusive of Pernicious Anemia, and in Chronic Icterus"

Dr Charles H Peck, New York "Splenectomy for Hemolytic Jaundice"

Dr Donald C Balfour, Rochester, Minn 'Indications for Splenectomy in Pernicious Anemia and the Technic of the Operation"

Dr Roy D McClure, Baltimore "Pernicious Anemia Treated by Splenectomy and Often-Repeated Blood Transfusions"

These six papers were discussed by Drs Frank Smithies, Chicago, Beth Vincent, Boston H Z Giffin, Rochester, Minn, W S Thayer, Baltimore, G A Friedman New York, S J Meltzer, New York, Walter V Brem Los Angeles, Roger I Lee Boston, Edward B Krumbhaar, Philadelphia, and Joseph L. Miller, Chicago

Thursday, June 15—Morning

The meeting was called to order at 9 15 by the vice chairman Dr Fred T Murphy, St Louis

The following officers were elected chairman, Dr W D Haggard Nashville, Tenn, vice chairman Dr A. A. Law, Minneapolis, secretary Dr E H Pool, New York, delegate Dr Dean D Lewis, Chicago, alternate, Dr John T Bottomley Boston

Dr Charles H Mayo, Rochester Minn read a paper on Removal of the Right Colon Indications and Technic."

Dr John T Bottomley, Boston read a paper on 'Some Results of Colectomy and Exclusion of the Colon in Cases of Chronic Arthritis '

These two papers were discussed by Drs Rea E. Smith, Los Angeles, W R. MacAusland Boston, J M Lynch, New York, J E Tuckerman, Cleveland, J Shelton Horsley, Richmond Va, J W *Draper New York, Joseph E.* Johnson, Memphis Tenn, and Charles H Mayo, Rochester Minn

Dr Raymond P A. Sullivan, Brooklyn read a paper on 'Perforating Ulcers of the Stomach and Duodenum Discussed by Drs Charles H Peck, New York J T Bottomley, Boston, H D Johnson, New York, and R P A Sullivan, Brooklyn

Dr John Staige Davis, Baltimore, read a paper on "Plastic and Reconstructive Surgery" Discussed by Drs Emery Marvel, Atlantic City, N J, and J S Stone, Boston

Dr W W Grant, Denver, read a paper on "Sarcoma of Intra-Abdominal Testicle" Discussed by Drs William B Coley New York, and W W Grant, Denver

Dr F Gregory Connell, Oshkosh, Wis, read a paper on "Chronic Appendicitis" Discussed by Drs J A Black, Pueblo Colo, E Laplace, Philadelphia, and M H Fussell, Philadelphia

Thursday, June 15—Afternoon

The meeting was called to order at 2 15 by the chairman, Dr E Wyllys Andrews, Chicago

Dr Emmet Rixford, San Francisco, delivered the oration on surgery, entitled "Surgical Aspects of the Industrial Accident Insurance" No discussion

Dr Lincoln Davis, Boston, read a paper on "Complications and Sequelae of the Operation for Inguinal Hernia" Discussed by Drs Henry O Marcy, Boston, Daniel N Eisendrath Chicago, Edward W Lee, New York, and Lincoln Davis Boston

Dr R. L Payne, Jr., Norfolk, Va., read a paper on "The Surgical Problem of Symptomless Hematuria Its Causes and Surgical Relief" Discussed by Drs H A Royster, Raleigh N C, J S Horsley, Richmond, Va, and R. L Payne, Jr Norfolk, Va

Dr A. R. MacAusland, Boston, read a paper on "A Consideration of Fractures and Other Injuries of the Hip"

Dr John C A. Gerster, New York, read a paper on "Nail Extension in Fractures of the Lower Extremity"

Dr Arthur T Mann, Minneapolis, read a paper on "Nails and Screws Through Joint Surfaces in Autografts and in Fractures Into Joints"

These three papers were discussed by Drs Charles E Thompson Scranton, Pa, R. H Sayre, New York, F H Albee New York, James T Watkins, San Francisco, W R. MacAusland, Boston, Charles A Parker, Chicago, A B Fitch, Factoryville Pa., L F Schmauss, Alexandria, Ind, and A. T Mann, Minneapolis

SECTION ON OBSTETRICS, GYNECOLOGY AND ABDOMINAL SURGERY

Tuesday, June 13—Afternoon

The meeting was called to order at 2 p m by the chairman, Dr Edward Reynolds, Boston

Dr E E Montgomery, Philadelphia, on motion, occupied the chair during the reading of the chairman s address Dr Reynolds expressed the hope that Dr Montgomery might consider discussion of the chairman s address, although such discussion was contrary to custom

Dr Edward Reynolds then presented the chairman s address, entitled 'The Uterine Secretions, Spermatozoa and Ovaries in Fertility and Sterility From Microscopic Studies" Discussed by Drs Emil Novak, Baltimore, and E Gustav Zinke, Cincinnati

Dr Reynolds then resumed the chair

Dr Emil Novak, Baltimore, read a paper on "The Corpus Luteum—Its Life Cycle and Its Role in Menstrual Disorders" Discussed by Dr Carey Culbertson, Chicago, and Dr Emil Novak, Baltimore.

Dr Henry T Hutchins, Boston read a paper on "The Role of the Anteposed Uterus in the Causation of Backache and Pelvic Symptoms.' Discussed by Drs Channing W Barrett and Albert Goldspohn, Chicago, Dr Walter P Manton Detroit, Dr E. E. Montgomery Philadelphia, Dr J H Carstens, Detroit and Dr Henry T Hutchins Boston

Drs Frederick H. Falls and Josiah J Moore, Chicago presented a paper on 'The Value of the Wassermann Test in Pregnancy," which was read by Dr Falls Discussed by Dr E. P Davis Philadelphia Dr J R. Losee New York, and Dr Frederick H Falls, Chicago

Dr Thomas S Cullen, Baltimore, read a paper on 'Adenomyoma of the Rectovaginal Septum ' Discussed by

Drs Carey Culbertson, Chicago, and Thomas S Cullen, Baltimore

Dr Frederick C Holden, Brooklyn, read a paper on "Obstetrics and Gynecology Under Ideal Conditions in a General Hospital" Discussed by Drs John Osborn Polak, Brooklyn, Charles S Bacon, Chicago, H P Newman, San Diego, Calif, and Frederick C Holden, Brooklyn

Wednesday, June 14—Morning

Drs J M Lynch and W L McFarland, New York, presented a paper on "Colonic Infections Some Seldom Described Nonspecific Types," which was read by Dr Lynch Discussed by Drs J W Draper, New York, and J M Lynch, New York

Dr Joseph Rilus Eastman, Indianapolis, read a paper on "Congenital Inflammation, Deformation and Defunctionalization of the Caudad Ileum and Colon" Discussed by Drs Albert Goldspohn, Chicago, F Gregory Connell, Oshkosh, Wis, J M Lynch, New York, J N Jackson, Kansas City, Mo, and Joseph Rilus Eastman, Indianapolis

Dr Charles A L Reed, Cincinnati, read a paper on "Anterior Parietal Implantation of the Colon for Ptosis" Discussed by Drs Franklin H Martin, Chicago, Robert T Morris, New York, Emery Marvel, Atlantic City, N J, and Charles A L Reed, Cincinnati

Dr Albert J Ochsner, Chicago, read a paper on "The Prevention of Obstruction of the Passage of Gas Following Operations on the Colon" Discussed by Drs W D Haggard, Nashville, Tenn, Charles A. L Reed, Cincinnati, and Dr Albert J Ochsner, Chicago

Dr Charles H Mayo, Rochester, Minn, presented a paper on Radical Operations for the Cure of Cancer of the Second Half of the Large Intestine" Discussed by Drs Edward Martin, Philadelphia, J M Lynch, New York, R C Coffey, Portland, Ore, J W Draper, New York, Julius H Jacobson, Toledo, Ohio, and Dr Charles H Mayo, Rochester, Minn

Wednesday, June 14—Afternoon

Dr John W Draper, New York, read a paper on "Intestinal Obstruction Further Experimental Studies" Discussed by Drs H D Johnson, New York, C Hugh McKenna, Chicago, and John W Draper, New York

Dr John Young Brown, St Louis, read a paper on "The Superiority of the Right Side Anus in the Handling of Partial and Complete Obstructions of the Lower Colon and Sigmoid in Cases Unsuited for Radical Operation" Discussed by Drs J M Lynch, New York, J Shelton Horsley, Richmond, Va, and John Young Brown, St Louis

Dr Thomas J Watkins, Chicago, read a paper on "Pelvic Infection in Women, Notes on Some Features of the Disease" Discussed by Drs E P Davis, Philadelphia, Thomas S Cullen, Baltimore, F F Lawrence, Columbus, Ohio, James C McMechan, Cincinnati, J H Carstens, Detroit, Channing W Barrett, Chicago, John B Deaver, Philadelphia, and Thomas J Watkins, Chicago

Dr John G Clark and Dr Charles C Norris, Philadelphia, presented a paper on "Results Following the Treatment of Pelvic Inflammatory Lesions By Surgical Measures," which was read by Dr Clark Discussed by Dr L S McMurtry, Louisville, Ky, E W Lee, New York, R C Coffey, Portland, Ore, Gordon G Copeland, Toronto, Albert Goldspohn, Chicago, and John G Clark, Philadelphia

Thursday, June 15—Morning

The following officers were nominated and elected chairman, Dr H W Longyear, Detroit, secretary, Brooke M Anspach, Philadelphia, delegate, Horace G Wetherill, Denver, alternate, Thomas S Cullen, Baltimore

Dr Gustav E Zinke, Cincinnati, read a paper on "The External Signs of Diagnosis of the Attitude of the Fetus in Utero" Discussed by Drs Walter P Manton, Detroit, John Osborn Polak, Brooklyn, Rachelle S Yarros, Chicago, and Gustav A Zinke, Cincinnati

Dr James W Markoe, New York, read a paper on "Posture in Obstetrics" Discussed by Drs Rudolph W Holmes, Chicago, Charles S Bacon, Chicago, E W Lee, New York, E P Davis, Philadelphia, Gustav A Zinke, Cincinnati, and James W Markoe, New York

Dr Isadore L. Hill, New York, read a paper on "The Use of Chloroform in the First Stages of Labor" Discussed by Drs C H Davis, Chicago, Joseph B De Lee, Chicago, John Osborn Polak, Brooklyn, Gustav A. Zinke, Cincinnati, J H Carstens, Detroit, Walter P Manton, Detroit, H O Marcy, Boston, C W Simpson, Waxahachie, Texas, Chester R Ogden, Clarksburg, W Va, Gordon G Copeland, Toronto, and Isadore L Hill, New York

Dr Edward P Davis, Philadelphia, read a paper on "Obstetric Surgery, A Modern Science, Its Scope and Limitations" Discussed by Drs Charles S Bacon, Chicago, Rudolph W Holmes, Chicago, Gustav A Zinke, Cincinnati, and John Osborn Polak, Brooklyn

With the consent of the section, the chairman announced that he would ask Dr De Lee of Chicago to read his paper and that the discussion might be continued to include the two papers

Dr Joseph B De Lee, Chicago, read a paper on "Meddlesome Midwifery in Renaissance," and the discussion was continued by Drs A. J Rongy, New York, Edward P Davis, Philadelphia, and Joseph B De Lee, Chicago

Thursday, June 15—Afternoon

Dr Walter Lathrop, Hazleton, Pa, read a paper on "Umbilical Hernia and Lipectomy" Discussed by Drs W Wayne Babcock, Philadelphia, Henry O Marcy, Boston, and Walter Lathrop, Hazleton, Pa

Dr John W Keefe, Providence, R I, read a paper on "Sheet Rubber Superior to Gauze Sponges in Abdominal Operation" Discussed by Drs Richard R Smith, Grand Rapids, Mich, C H Magee, Burlington, Iowa, S C Stremmel, Macomb, Ill, Stephen E Tracy, Philadelphia, F F Lawrence, Columbus, Ohio, John J Reycraft, Petoskey, Mich, and John W Keefe, Providence, R. I

Dr Donald Guthrie, Sayre, Pa, read a paper on "Indications for Cholecystectomy" Discussed by Drs John B Deaver, Philadelphia, H S Noble, St. Marys, Ohio, and F F Lawrence, Columbus, Ohio

Dr Stephen E Tracy, Philadelphia, read a paper on "A Report on One Hundred Consecutive Cases of Fibromyomata Uteri Subjected to Operation"

Dr John B Deaver, Philadelphia, read a paper on "Operative Treatment of Fibromyomatous Uterine Tumors"

Dr Julius H Jacobson, Toledo, Ohio, read a paper on "Recent Progress in the Surgical Treatment of Uterine Cancer" These three papers were discussed by Drs Henry T Byford, Chicago, J H Carstens, Detroit, Henry Schmitz, Chicago, F F Lawrence, Columbus, Ohio, E. W Lee, New York, C M Echols, Milwaukee, Wis, Stephen A Tracy, Philadelphia, John B Deaver, Philadelphia, and Julius H Jacobson, Toledo, Ohio

SECTION ON OPHTHALMOLOGY

Tuesday, June 13—Afternoon

The meeting was called to order at 2 o'clock, by the chairman, Dr Walter R Parker, Detroit

Dr Walter R Parker, Detroit, read the chairman's address, entitled "The Relation of Choked Disk to the Tension of the Eyeball in Brain Tumor Cases" Discussed by Drs James Bordley, Jr, Baltimore, and John E Weeks, New York

Dr Mark J Schoenberg, New York, read a paper on "Intracranial Treatment of Syphilitic and Parasyphilitic Optic Nerve Affections, Physiologic Evidences Researches on Intravital Staining of the Optic Nerve" Discussed by Dr Udo J Wile, Ann Arbor, Mich, James B Ayer, Jr., Boston, J S Wyler, Cincinnati, George S Derby, Boston, and Mark J Schoenberg, New York.

Dr Cassius D Wescott, Chicago, read a paper on "A Case of Granuloma Pyogenicum Affecting the Eyelid" Discussed by Drs Lee Masten Francis, Buffalo, Udo J Wile, Ann Arbor, Mich, John E Weeks, New York, Harold Gifford, Omaha, Edward Jackson, Denver, and Cassius D Wescott, Chicago

Dr George Slocum, Ann Arbor, Mich , read a paper on "A Study of Ophthalmoscopic Changes in Nephritis" Discussed by Drs A. E. Bulson, Jr, Fort Wayne, Ind , E. E Blaauw Buffalo, E J Bernstein, Kalamazoo, Mich , George E de Schweinitz, Philadelphia, S D Risley, Philadelphia, Edward Jackson, Denver, Walter R Parker, Detroit, and George Slocum, Ann Arbor, Mich

Dr William L. Clark, Philadelphia, read a paper on The Uses of the Desiccation Method in Ophthalmology, with Special Reference to Epithelioma of Lids, Canthi and Conjunctiva Report of Cases" with lantern demonstration Discussed by Drs S Lewis Ziegler, Philadelphia, W C Posey, Philadelphia, and by William L Clark, Philadelphia

Wednesday, June 14—Morning

The following cases and new instruments were presented

Dr G M Waldeck, Detroit, presented a child with blue sclerotics who was subject to spontaneous fractures

Dr Lucien Howe, Buffalo, exhibited an instrument involving thermocouples for measuring the temperature of the eye

Dr E. J Bissell, Rochester, N Y, presented an instrument for a two-point fixation test for campimetry

D J E. Jennings, St Louis presented his latest modification of his skein colorblindness test

Dr G C. Savage Nashville, Tenn, presented an improvement on Dr Vard H Hulen's vacuum cup for use in extraction of the cataractous lens in its capsule. Discussed by Drs G C Savage, Nashville, Tenn., and Vard H Hulen, San Francisco

Dr Mark J Schoenberg, New York, exhibited some specimens demonstrating the permeability of the optic nerve and its sheath by substances injected into the spinal canal and intraventricularly

Dr H S Gradle Chicago, in discussing Dr Schoenberg's specimens, suggested that the optic nerve might be reached by injections into the nasal and accessory sinuses, and described the anatomy of the parts

Dr Walter R. Parker Detroit, exhibited a monkey in which a brain tumor had been induced by the introduction of a foreign substance under the dura producing a swelling of the disk After a month the swelling was shown to be subsiding, although the foreign substance was still within the cavity

Dr H. S Gradle, Chicago, read a paper on "A New Instrument for the Clinical Measurement of Dark Adaptation" Discussed by Drs E A. Willis, Indianapolis, and Walter B Lancaster, Boston

Dr Lucien Howe, Buffalo read a paper on "The Fatigue of Accommodation as Registered by the Ergograph" Discussed by Drs Hiram Woods, Baltimore, G C Savage, Nashville, Tenn , Walter B Lancaster, Boston, E E Blaauw, Buffalo, George H. Price, Nashville, Tenn, and Lucien Howe, Buffalo

Dr Edward C Ellett, Memphis Tenn., read a paper on "A Primary Intradural Tumor of the Optic Nerve Removal with Preservation of the Ball" Discussed by Drs G E. de Schweinitz, Philadelphia, and Arnold Knapp New York

Dr Harold Gifford Omaha, read a paper on "Homatropin Glaucoma Its Occurrence and Prevention" Discussed by Drs Eugene Smith, Detroit, Charles H May, New York, W W Kahn Detroit John Green, St Louis, A. G Bennett, Buffalo, Hiram Woods Baltimore, A E. Bulson Jr, Fort Wayne, Ind , E E Blaauw, Buffalo, John E. Weeks, New York, W H Wilder, Chicago, Frederick Frisch, Atlantic City, N J , J W Charles, St. Louis, and Harold Gifford, Omaha.

Dr S D Risley, Philadelphia, moved that the executive committee or the committee on publication be instructed to confer with the author of the paper with a view to changing the title

The author consented to a change in the title, and the motion, though seconded, was not voted on.

Dr William Zentmayer, Philadelphia, read a paper on 'Traumatic Pulsating Exophthalmos ' Discussed by Drs Frank E. Burch, St Paul, W H. Wilder, Chicago, M. H Lebensohn Chicago, Harold Gifford, Omaha, T B Holloway, Philadelphia, and William Zentmayer, Philadelphia.

Wednesday, June 14—Afternoon

Dr Will Walter, Chicago, read a paper on "The Etiology of Nonparalytic Ocular Imbalance Some Original Conceptions and Interpretations Based on the Physiology and Psychology of Ocular Movements" Discussed by Drs G C Savage, Nashville Tenn , George H Price, Nashville, Tenn , Wendell Reber, Philadelphia, and Will Walter, Chicago

Dr Wendell Reber, Philadelphia, read a paper on 'Heterophoria in Children" Discussed by Dr George H. Price, Nashville Tenn , A E Bulson, Jr, Fort. Wayne, Ind , G C Savage, Nashville, Tenn, and Wendell Reber, Philadelphia

Dr F C Todd Minneapolis read a paper on "Strabismus Produced by Operations for Strabismus A Consideration of Causes Producing Deformities Following Strabismus Operations, with Suggestions for Corrective Operative Procedure'

Dr Roderic P O'Connor, Oakland, Calif, read a paper on "A New Shortening Technic, with Report of Forty-Two Operations"

These two papers were discussed by Drs H W Woodruff, Joliet, Ill , W C Posey, Philadelphia, Oscar Dodd, Chicago, Lucien Howe, Buffalo, G C. Savage, Nashville, Tenn , Will Walter Chicago, Wendell Reber, Philadelphia, F C Todd, Minneapolis, and Roderic P O'Connor, Oakland, Calif

At the close of the scientific program, Dr Aaron Samuel Green San Francisco, presented some moving pictures of India of Colonel Smith operating for cataract by his method, and some other operations showing the removal of the cataract in capsule according to the Smith method.

Thursday, June 15—Morning

Dr C H Williams, Boston, chairman, read the report of the Committee on Color Vision Discussed by Drs F Park Lewis, Buffalo Walter R Parker, Detroit, and Nelson M Black, Milwaukee, Wis

Dr Walter R. Parker, Detroit, moved that the last paragraph of the report which recommends the use of additional field tests for enginemen be eliminated Motion carried

Dr F C Todd, Minneapolis, moved the adoption of the report as amended, and the discharge of the committee. Motion carried

Dr Edward Jackson, Denver, chairman read the report of the committee on Standardizing Test Cards for Visual Acuity Discussed by C H Williams, Boston, and Edward Jackson, Denver

On motion the report was adopted, to be printed in the transactions, and the committee continued

Dr Walter R Parker, Detroit, chairman, read the report of the Committee on Elliot Trephining Operation

On motion the report was accepted and the committee continued

Dr Lucien Howe, Buffalo, chairman, read the report of the Committee on Collective Investigation of the Ocular Muscles

On motion the report was accepted and the committee continued

Dr A E. Bulson, Jr, Fort Wayne, Ind, chairman, read the report of the Committee on Knapp Testimonial Fund Discussed by Edward Jackson, Denver, and Casey A. Wood, Chicago Dr Jackson moved the acceptance of the report for publication in the transactions Motion carried

Dr George E. de Schweinitz, Philadelphia chairman read the report of the Committee on Award of the Knapp Medal It was moved and seconded that the report of the committee be accepted and the medal awarded in accordance therewith to Dr George S. Derby Boston The motion carried, and Dr A E Bulson Jr Fort Wayne, Ind of the Committee on Knapp Testimonial Fund, presented the medal

The report concerning a board on education in ophthalmology was summarized by Dr Edward Jackson, Denver

Dr George E de Schweinitz Philadelphia, moved that the report be adopted and published The motion was seconded On objection by Dr George H Price, Nashville Tenn, that the report could not be adopted without being passed on by the section, but that it could be accepted for publication, Dr de Schweinitz withdrew his motion Dr Edward Jackson explained that the report was the work of three different organizations and not of the Section on Ophthalmology alone, and was for the purpose of informing the section what had been done It was not necessary for the section to adopt the report

Dr de Schweinitz then moved the acceptance of the report for publication This motion carried

Dr Hiram Woods, Baltimore, chairman, presented the report of the Executive Committee on Nomination for officers of the section and one member of the examining board, Dr E C Ellett's term having expired, as follows chairman, Dr William Zentmayer, Philadelphia, vice chairman, Dr Cassius D Westcott, Chicago, secretary for the term of three years, Dr George S Derby, Boston, representative of the section in the House of Delegates, Dr F Phinizy Calhoun, Atlanta, Ga, member of the Board on Ophthalmic Examinations, Dr E C Ellett, Memphis, Tenn

Dr Woods explained that the last was not unanimous, but that Dr Todd and he thought it was important to keep Dr Ellett on the committee

On motion of Dr Edward Jackson, duly seconded, the chairman of the section was directed to cast the ballot of the section for all of the officers named, which was done

Nominations were called for the Committee on Award of the Knapp Medal, and the following were nominated Dr John E Weeks, New York, Dr Charles H May, New York, Dr George E de Schweinitz, Philadelphia, and Dr William C Posey, Philadelphia

Dr de Schweinitz withdrew his name, and the nominations having on motion been closed, it was moved by Dr A E Bulson that the other three men named be elected as members of the Committee on Award of the Knapp Medal Motion carried

Dr Walter B Lancaster, Boston, read a paper on "The Preparation of the Patient for Operation" Discussed by Drs W H Wilder, Chicago, W H Snyder, Toledo, Ohio, H S Gradle, Chicago, M C Rose, New York, J A Donovan, Butte, Mont, Aaron Samuel Green, San Francisco, Wendell Reber, Philadelphia, C W Hawley, Chicago, Lee M Francis, Buffalo, M Feingold, New Orleans, and Walter B Lancaster, Boston

Dr William E Shahan, St Louis, read a paper on "Effects of Heat on the Eye" Discussed by Drs Thomas B Holloway, Philadelphia, John Green, St Louis, Lucien Howe, Buffalo, and William E Shahan, St Louis

Dr Marcus Feingold, New Orleans, read a paper on "Progressive Macular Degeneration in Three Members of a Family" Discussed by Drs J E Weeks, New York, Lucien Howe, Buffalo, and M Feingold, New Orleans

Thursday, June 15—Afternoon

Dr Casey A Wood, Chicago, gave a lantern demonstration on "A Comparative Study of the Fundus Oculi, Especially in Birds" No discussion

Dr Arnold Knapp, New York, read a paper on "Retinal Detachment in Hydrophthalmia" Discussed by Drs Don M Campbell, Detroit, and T B Holloway, Philadelphia

Dr Edward Jackson, Denver, read a paper on "Discission of the Crystalline Lens"

Dr William Evans Bruner, Cleveland, read a paper on "Preliminary Capsulotomy in Immature Cataract"

These two papers were discussed by Drs W E Gamble, Chicago, L M Francis, Buffalo, H Gifford, Omaha, S D Risley, Philadelphia, J G Dorsey, Wichita, Kan, D C Louchery, Clarksburg, W Va, E J Bissell, Rochester, N Y, C W Hawley, Chicago, Mary Buchanan, Philadelphia, G C Savage, Nashville, Tenn, Edward Jackson, Denver, and W E Bruner, Cleveland

The retiring chairman, Dr W R Parker, thanked all who had contributed to the success of the meeting

The chairman-elect, Dr William Zentmayer, was inducted into office

Dr S D Risley, Philadelphia, moved a rising vote of thanks to the retiring chairman

SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Tuesday, June 13—Afternoon

The meeting was called to order at 2 o'clock by the chairman, Dr Hill Hastings, Los Angeles

Dr Hastings read the chairman's address, entitled "Purulent Infections of the Ear, Nose and Throat Our Responsibility to the Public"

Dr Chester C Cott, Buffalo, read a paper on "Xanthosis and Causes of Septal Bleeding" Discussed by Drs Emil Mayer, New York, Henry B Hitz, Milwaukee, George F Cott, Buffalo, Cullen F Welty, San Francisco, C M Brown, Buffalo, and Chester C Cott, Buffalo

Dr James J King read a paper by himself and Dr John J Conellan, New York, on "Further Observations on the Connellan-King Diplococci Throat Infections and Their Sequelae, with Especial Reference to Arthritis" with lantern demonstration Discussed by Drs John J Connellan, New York, Emil Mayer, New York, Virgil P Gibney, New York, Isaac H Jones, Philadelphia, George F Cott, Buffalo, and James J King, New York

Dr Thomas E Carmody, Denver, read a paper on "Cleft Palate and Hare Lip" (lantern demonstration), with presentation of a case of cleft palate by Dr Burt R Shurly, Detroit Discussed by Drs Charles H Oakman, Detroit, John F Barnhill, Indianapolis, William W Carter, New York, and Thomas E Carmody, Denver

Dr Greenfield Sluder, St Louis, read a paper on "The Method of Tonsillectomy by Means of the Alveolar Eminence of the Mandible and Guillotine" Discussed by Drs G Hudson Makuen, Philadelphia, George Paull Marquis, Chicago, W Eugene Dixon, Oklahoma City, Eugene R Lewis, Dubuque, Iowa, William W Carter, New York, John O McReynolds, Dallas, Texas, John F Barnhill, Indianapolis, Hanau W Loeb, St Louis, William S Tomlin, Indianapolis, Cullen F Welty, San Francisco, Elmer E Henderson, Chicago, Oliver Tydings, Chicago, and Greenfield Sluder, St Louis

The chairman appointed as a nominating committee Drs Robert Levy, Denver, Burt R Shurly, Detroit, and Norv H Pierce, Chicago

Wednesday, June 14—Morning

Dr Emil Mayer moved that the papers of the morning be read, that the opening discussions be given, and that further discussion be postponed until after the Barany pictures, to be shown at 11 30 Motion carried

The following papers were read as a symposium on "Chronic Suppuration of the Nasal Accessory Sinuses"

Dr Joseph C Beck, Chicago "The Evolution of the Frontal Sinus Operation, with Special Reference to the External Operation"

Dr Lee M Hurd, New York "Intranasal Surgery for Relief of Chronic Frontal Sinusitis"

Dr G E Shambaugh, Chicago "Surgery of the Ethmoid"

Dr William E Sauer, St Louis "Surgical Treatment of Chronic Suppuration of the Maxillary Sinus"

Dr Hanau W Loeb, St Louis "The Sphenoid Sinuses, a Review of the Past with Suggestions for the Future"

Dr Ross H Skillern, Philadelphia "Operations on the Sphenoid Sinuses"

Dr Samuel Iglauer, Cincinnati "Roentgenography of the Sphenoid and Ethmoid Cells by the Oblique Method (Lantern Demonstration)"

Dr George F Cott, Buffalo "Ethmoid Empyema Acute and Chronic"

These eight papers were discussed by Drs H P Mosher, Boston, Lee Cohen, Baltimore, H Y McNaught San Francisco, Francis W Alter, Toledo, Ohio, Joseph C Beck, Chicago, George F Cott, Buffalo, G E Shambaugh, Chicago, and Samuel Iglauer, Cincinnati

Wednesday, June 14—Afternoon

The following papers were read as a symposium on "Chronic Suppurative Otitis Media"

Dr George W Mackenzie, *Philadelphia* "Chronic Middle Ear Suppuration"

Dr Norval H Pierce, Chicago 'Nonoperative Treatment of Otitis Media"

Dr John F Barnhill Indianapolis "End-Results of Treatment of Otitis Media"

These three papers were discussed by Dr Francis T Emerson, Boston

At this time the Barany pictures were shown, giving tests of vestibular apparatus

Dr Emil Mayer, New York, moved that a vote of thanks be extended to Dr Isaac H Jones, Philadelphia, for presenting these pictures, and that his remarks be incorporated in the transactions of this section Motion carried

The three foregoing papers were further discussed by Drs W E Dixon, Oklahoma City, Cullen F Welty, San Francisco, Emmett L Jones, Cumberland Md, J Holinger, Chicago, A E Prince, Springfield Ill, H B Harris Dayton, Ohio, W S Tomlin Indianapolis, Charles M Robertson, Chicago, Clark W Hawley Chicago, George W Mackenzie, Philadelphia Norval H Pierce, Chicago, and Joseph C Beck, Chicago

Dr Philip D Kerrison New York, read a paper on "The Mastoid Operation of Ten Years Ago and Today Gradual Changes in Operative Methods and Technic Brief Estimate of the Advance as Measured by Practical Results" Discussed by Drs R B Canfield Ann Arbor Mich, Cullen F Welty, San Francisco, Joseph C Beck Chicago, Wendell C Phillips, New York and Philip D Kerrison New York

Dr David J Davis Chicago read a paper on "Vaccine Therapy Its Possibilities and Limitations" Discussed by Dr John A Pratt Aurora Ill

Dr George M Coates Philadelphia read a paper on "Clinical Experience with Use of Vaccines in Diseases of the Ear Nose and Throat' Discussed by Dr Daniel W Layman, Indianapolis

Thursday June 15—Morning

The meeting was called to order at 9 15 by the chairman, the first order of business being the report of the Nominating Committee This committee offered the following names for consideration chairman Dr Francis P Emerson, Boston, vice chairman Dr Greenfield Sluder St Louis, secretary Dr L W Dean Iowa City Iowa, representative in House of Delegates Dr Robert Levy, Denver, alternate, Dr Elmer L. Kenyon Chicago

Moved and carried that the report of the Nominating Committee be accepted as read and that Dr John J Kyle of Los Angeles cast the ballot of the entire section for the names read Motion carried

The report of the Committee on Teaching Oto-Laryngology, was read by Dr Robert Levy, chairman of the committee Moved and carried that the report be accepted

The chairman appointed Dr H P Mosher Boston, to fill the vacancy on this committee caused by the death of Dr Ballinger

The chairman appointed as an obituary committee Drs Joseph C Beck, Chicago and R. B Canfield Ann Arbor, Mich with instructions to report at the afternoon section

The chairman appointed Drs Ross H Skillern and G Hudson Makuen Philadelphia as a committee to frame suitable resolutions expressing the appreciation of the section for the entertainment given them by Dr Burt R. Shurly Detroit.

The following papers were read as a symposium on "Examination and Treatment of the Bronchi and Larynx"

Robert F Ridpath Philadelphia "The Possibilities and Limitations of Nonsurgical Bronchoscopic Treatment'

Robert C Lynch New Orleans "Possibilities and Limitations of Suspension Laryngoscopy"

These two papers were discussed by Dr W B Chamberlin, Cleveland

Dr Chevalier Jackson Pittsburgh read a paper on "New Solutions of Mechanical Problems of Foreign-Body Bronchoscopy," with lantern demonstration Discussed by Drs Thomas Hubbard, Toledo, Samuel Iglauer Cincinnati, H P Mosher Boston, Ross H Skillern Philadelphia, George F Cott Buffalo, W E Dixon Oklahoma City, George F Keiper, Lafayette, Ind Robert H Good Chicago Lee Cohen, Baltimore, J W Murphy, Cincinnati W R Butt, Carton Ohio, Robert F Ridpath, Philadelphia, and Chevalier Jackson Pittsburgh

Dr Lee Cohen Baltimore, read a paper on "Correction of External Nasal Deformities by Subcutaneous Method (Lantern Demonstration)" Discussed by Drs W W Carter, New York, Elmer L Kenyon, Chicago and Lee Cohen, Baltimore

Thursday, June 15—Afternoon

From 1 30 until 2 o'clock opportunity was given members to present instruments, etc

Dr George F Cott, Buffalo presented an instrument to prevent snoring This is an attachment to the nosepiece of eyeglasses

Dr Joseph D Heitger, Bedford, Ind, presented a modification of Beck's tonsil instrument, providing better control of the instrument

Dr Frank C Todd, Minneapolis, presented a tonsillectomy forceps which bites not up and down as the ordinary forceps, but in the other direction

Dr Albin M Painter, Youngstown Ohio, presented an arrangement of ring to steady the carrying light on the nasal pharyngoscope to be used in removing the posterior tip under direct inspection

Dr R E Mercer, Detroit, showed a tube which is used for drain in the antrum

Dr Samuel Iglauer, Cincinnati, presented a "bronchoihoscope,' a small tunnel which corresponds to the light carrier on the Jackson tube

Dr A. E Rector, Appleton, Wis, showed a frontal sinus curet

Dr Robert Sonnenschein, Chicago, showed a small flexible hearing tube

Dr Clark W Hawley, Chicago, presented an aluminum hearing fan

Dr Wendell C Phillips New York read a paper on "Clinical Types of Labyrinthitis with Comments on Treatment."

Dr Isidore Friesner, New York read a paper on "The Differential Diagnosis Between Purulent Labyrinthitis and Cerebellar Lesions"

Dr Wells P Eagleton, Newark, N J, read a paper on "The Importance of Aural Symptoms in the Early Diagnosis of Pontile Cerebellar Angle Growths (Lantern Demonstration)"

These three papers were discussed by Drs Horace Newhart Minneapolis, I H Jones Philadelphia, J Holinger, Chicago, George W Mackenzie Philadelphia, L Fisher Philadelphia, Isidore Friesner, New York, and Wells P Eagleton Newark N J

The following resolution was presented

> The Section of Otolaryngology of the American Medical Association desires to express its appreciation of the generous hospitality of *Dr Shurly and the other Detroit* members during the session, and also to express its thanks to the management of the Hotel Statler for the excellent provisions made for the scientific proceedings

The following resolution was presented by the obituary committee

> Whereas *The following members of this section have been called* from our midst by death and
>
> Whereas The loss of these worthy and distinguished gentlemen is keenly felt by the section and by the profession in general be it
>
> *Resolved* That we, by rising pay deference to the memory of William Ballinger John O Roe and John R. Fletcher be it further
>
> *Resolved* That a copy of this resolution be spread on the minutes and that the Secretary be instructed to notify the families of the deceased of this action

Dr Burt R Shurly Detroit read a paper on "The Relation of the Ductless Glands to Rhinology" No discussion

SECTION ON DERMATOLOGY

Tuesday June 13—Afternoon

The meeting was called to order at 2 20 p m by the chairman Dr Howard Morrow San Francisco Dr Morrow then read the chairman s address, entitled "The Teaching of Dermatology"

The secretary read a letter from Dr Martin F Engman, St Louis addressed to the chairman submitting his report as chairman of the Committee on Leprosy, appointed by this section at the session of the American Medical Association held in 1914

Dr William A Pusey, Chicago, moved that the delegate be instructed to report to the House of Delegates that it was the consensus of opinion of the section that the measure for a national leprosarium now before Congress should be endorsed

Dr Everett S Lain, Oklahoma City, in seconding Dr Pusey's motion, said he had recently learned from Dr Engman that the outlook for this bill was extremely favorable, that it had passed the Senate and had been reported on favorably by the House committee, and that all that was required for its final passage was urging Dr Pusey's motion was thereupon carried, and the delegate of the section was requested to bring the matter before the House of Delegates

Dr *Oliver S Ormsby and Dr James Herbert Mitchell*, Chicago, presented a paper on "Ringworm of the Hands and Feet" Discussed by Drs William T Corlett, Cleveland, Henry C Baum, Syracuse, Richard L Sutton, Kansas City, Mo, Jay F Schamberg, Philadelphia, A Ravogli, Cincinnati, William A Pusey, Chicago, James M King, Nashville, George M MacKee, New York, Walter J Heimann, New York, Ernest Dwight Chipman, San Francisco, Franklin W Cregor, Indianapolis, Clarence J Broeman, Cincinnati, James H Mitchell, Chicago, and Oliver S Ormsby, Chicago

Dr A Ravogli, Cincinnati, read a paper on "Condyloma Acuminatum of the Anal Region" Discussed by Drs Philip Kilroy, Springfield, Mass, William A Pusey, Chicago, William T Corlett, Cleveland, and A Ravogli, Cincinnati

Dr Ernest Dwight Chipman, San Francisco, read a paper on "Dermatologic Dietetics" Discussed by Drs L Duncan Bulkley, New York, Jay F Schamberg, Philadelphia, William A Pusey, Chicago, A Ravogli, Cincinnati, Richard L Sutton, Kansas City, Mo, Marcus Haase, Memphis, Philip Kilroy, Springfield, Mass, Everett S Lain, Oklahoma City, H H Hazen, Washington, D C, Louis L Seaman, New York, Henry C Baum, Syracuse, James M King, Nashville, Tenn, and Ernest Dwight Chipman, San Francisco

The chairman announced that owing to sickness, Dr Fred Wise of New York had requested to be permitted to read his paper out of the regular order of the program This request had received the approval of the Executive Committee and of Dr MacKee, who was willing to postpone his paper for the convenience of Dr Wise

Dr Fred Wise, New York, read a paper on "Pityriasis Lichenoides Chronica A Clinical and Microscopic Study" Discussed by Dr Oliver S Ormsby, Chicago

Dr George Miller MacKee, New York, read a paper on "Erythrodermia Congenitale Ichthyosiforme," with lantern demonstration Discussed by Drs Fred Wise, New York, William A. Pusey, Chicago, and Udo J Wile, Ann Arbor, Mich

Wednesday, June 14—Morning

The meeting was called to order at 9 30 a m

The chairman announced the following to serve as a Nominating Committee Drs Grover W Wende, Buffalo, Richard L Sutton, Kansas City, Mo, and Howard Fox, New York

The following papers were read as a symposium on "Neoplasms"

Dr Meyer L Heidingsfeld, Cincinnati "The Etiologic Role of Scar Tissue in Skin Cancer," with lantern demonstration

Dr Clarence J Broeman, Cincinnati "The Treatment of Epithelioma"

Dr George E Pfahler, Philadelphia "The Treatment of Malignant Disease About the Mouth by Combined Methods," with lantern demonstration

Dr Frank Edward Simpson, Chicago "Radium in the Treatment of Cancer and Various Other Diseases of the Skin," with lantern demonstration

Dr Samuel E Sweitzer, Minneapolis "Leukemia Cutis Report of a Case," with demonstration of patient

These five papers were discussed by Drs H H Hazen, Washington, D C, William H B Aikins, Toronto (by invitation), Richard L Sutton, Kansas City, Mo, Howard Morrow, San Francisco, George M MacKee, New York, Walter I Le Fevre, Cleveland, Meyer L Heidingsfeld, Cincinnati, George E Pfahler, Philadelphia, Frank E Simpson, Chicago, and Samuel E Sweitzer, Minneapolis

The vice chairman, Dr Everett S Lain, Oklahoma City, introduced Dr Charles R Hume of Anadarko, Okla., the president of the Oklahoma State Medical Society

Wednesday, June 14—Afternoon

The meeting was called to order at 2 15 p m

The following papers were read as a symposium on "Syphilis"

Dr Harold N Cole, Cleveland "Report of a Series of Sixty-One Extragenital Chancres," with lantern demonstration

Capt Mathew A Reasoner, Washington, D C "Some Phases of Experimental Syphilis, with Special Reference to the Question of Strains," with lantern demonstration

Dr Richard L Sutton, Kansas City, Mo "The Dyschromias of Syphilis," with lantern demonstration

Drs Udo J Wile and Joseph A Elliott, Ann Arbor, Mich "An Analysis on One Hundred and Twenty-Five Cases of Tertiary Syphilis, with Particular Reference to Their Early Treatment"

Drs Jay Frank Schamberg, John A. Kolmer and George W Raiziss, Philadelphia "The Administration of Dioxydiamido Arsenobenzol Dichlorhydrate by Mouth to Man and Animals"

Drs William B Trimble and John J Rothwell, New York "A Comparative Study of Salvarsan and Neosalvarsan in the Treatment of Syphilis"

Dr H G Irvine, Minneapolis "Notes on the Teaching of Syphilis"

These seven papers were discussed by Drs William A Pusey, Chicago Udo J Wile, Ann Arbor, Mich, Walter J Heimann, New York, Philip Kilroy, Springfield, Mass, L H Cook, Bluffton, Ind, Samuel E Sweitzer, Minneapolis, Franklin W Cregor, Indianapolis, Richard L Sutton, Kansas City, Mo, Henry C Baum, Syracuse, David Lieberthal, Chicago, Harold N Cole, Cleveland, Jay F Schamberg, Philadelphia, Joseph A Elliott, Ann Arbor, Mich, John J Rothwell, New York, and H G Irvine, Minneapolis

On motion, a vote of thanks was extended to Captain Reasoner for his interesting paper and lantern demonstration

Thursday, June 15—Morning

The following officers were elected chairman, Dr H R Varney, Detroit, vice chairman, Dr Frank E Simpson, Chicago, secretary, Dr H H Hazen, Washington, D C, delegate, Dr Richard L Sutton, Kansas City, Mo, alternate Dr Philip Kilroy, Springfield, Mass

The following papers were read as a symposium on "Eczema"

Dr Walter J Heimann, New York "The Pathology and Pathogenesis of Eczema in Dermatitis The Identity of the Two Diseases"

Dr Charles J White, Boston "Two Modern Methods to Be Employed in the Treatment of Chronic Eczema"

Dr Frank C Knowles, Philadelphia "Eczema of External Causation"

These three papers were discussed by Drs Ernest L McEwen, Chicago, Jay F Schamberg, Philadelphia, Henry T Byford, Chicago, Richard L Sutton, Kansas City, Mo, B E Sager, Cleveland, M L Ravitch, Louisville, Ky, Andrew P Biddle, Detroit, Ernest D Chipman, *San Francisco*, John G Burke, Pittsburgh, J M King, Nashville, Lloyd W Ketron, Baltimore, Isadore Dyer, New Orleans, Samuel E Sweitzer, Minneapolis, H H Hazen, Washington, D C, H C Baum, Syracuse, N Y, Frank W Cregor, Indianapolis, R A C Wollenberg, Detroit, Walter J Heimann, New York, Charles J White, Boston, and Frank C Knowles, Philadelphia.

Dr David Lieberthal, Chicago, read a paper on "A Contribution to the Rarer Forms of Lichen *Planus*" Discussed by Drs A Ravogli, Cincinnati, Fred Wise, New York, Richard L Sutton, Kansas City, Mo, H H Hazen, Washington, D C, Walter J Heimann, New York, Lloyd W Ketron, Baltimore, and David Lieberthal, Chicago

Thursday, June 15—Afternoon

Dr M L Ravitch, Louisville, Ky , read a paper on "Focal Infection in Relation to Dermatology" Discussed by Drs Everett S Lain, Oklahoma City, Richard L Sutton, Kansas City, Mo , Walter J Heimann, New York, Ernest L McEwen, Chicago, Howard Morrow, San Francisco, and M L Ravitch, Louisville

Drs Lloyd W Ketron and John H King, Baltimore, read a paper on 'Gastro-Intestinal Findings in Acne Vulgaris" Discussed by Drs M L Ravitch, Louisville, H H Hazen, Washington D C , Walter J Heimann, New York, and Lloyd W Ketron Baltimore

Dr Philip Kilroy, Springfield, Mass read a paper on 'Itching as a Symptom" Discussed by Drs Everett S Lain, Oklahoma City, Frank C Knowles Philadelphia, A Ravogli, Cincinnati, M L Ravitch, Louisville, Ky , and Philip Kilroy, Springfield, Mass

Before adjournment a unanimous vote of thanks was extended to the resident members of the section for their many acts of kindness during the meeting

Friday, June 16—Morning

At a clinical session which convened at the Harper Hospital at 9 a m patients were presented by Drs Udo J Wile Ann Arbor Mich Andrew P Biddle Detroit, H R Varney Detroit, Rollin H Stevens Detroit, R A C Wollenberg, Detroit, and E D Tucker Toledo, Ohio

These cases were discussed by Drs Richard L Sutton, Kansas City, Mo , Ernest D Chipman San Francisco, Frank C Knowles, Philadelphia, H R Varney Detroit, O H Foerster Milwaukee Andrew P Biddle Detroit, A Ravogli Cincinnati, H H Hazen Washington, D C , J M King Nashville, Tenn , Howard Morrow San Francisco, Samuel E Sweitzer, Minneapolis, Philip Kilroy, Springfield, Mass , and Clarence J Broeman, Cincinnati

---

SECTION ON NERVOUS AND MENTAL DISEASES

Tuesday, June 13—Afternoon

The section was called to order by the chairman, Dr George A Moleen, Denver

Dr George A Moleen, Denver, read the chairman s address entitled "The Nervous System as Influenced by High Altitudes"

Dr Peter Bassoe Chicago, read a paper on 'Tumors of the Third and Fourth Ventricles" with lantern demonstration Discussed by Drs Theodore H Weisenburg Philadelphia, Tom A Williams Washington, D C , Harold N Moyer, Chicago, Lawson G Lowrey Hathorne Mass , A L Skoog, Kansas City Mo., and Peter Bassoe Chicago

The chairman appointed the following members to act as a nominating committee Drs Theodore H Weisenburg, Philadelphia, chairman, C Eugene Riggs, St Paul, and Walter F Schaller San Francisco

Dr R Foster Kennedy, New York, read a paper on "A Further Note on the Diagnostic Value of Retrobulbar Neuritis in Expanding Lesions of the Frontal Lobes" Discussed by Drs Francis R Fry, St Louis, and R Foster Kennedy, New York

The chairman referred to the recommendation received from the secretary of the Council on Scientific Assembly that the Section on Nervous and Mental Diseases be made a part of a general section on medicine with a view to condensation of the number of sections, stating that it would be well for those interested in the work of the section to give the matter thought, and in case any action were to be taken in the way of recommendations to the House of Delegates, he would be glad to entertain a motion to that effect

Dr Theodore H Weisenburg, Philadelphia, read a paper on A Clinical Study of Unusual Symptoms in Hemiplegia and Diplegia Discussed by Francis X Dercum, Philadelphia, Walter Timme, New York, George A Moleen, Denver, J Ramsay Hunt, New York, and Theodore H Weisenburg, Philadelphia

Dr Charles K Mills, Philadelphia, read a paper on "Some Clinical Studies of the Problems of Cerebral Tone" Discussed by Drs William J Hickson, Chicago, Julius Grinker, Chicago, R Foster Kennedy, New York, J Ramsay Hunt, New York, and Charles K Mills, Philadelphia

On motion, carried, the subject of the condensation of this section with a general section on medicine was made a special order of business to be considered at the termination of the scientific program Wednesday morning

Dr I Leon Meyers, Chicago, read a paper on "Cerebellar Localization An Experimental Study by a New Method" Discussed by Drs Julius Grinker, Chicago, Charles K Mills, Philadelphia, Tom A Williams, Washington, D C, and I Leon Meyers, Chicago

Wednesday, June 14—Morning

The chairman announced that, in order to expedite matters, it had been suggested that a committee be appointed for the purpose of formulating and presenting to this body for its consideration a resolution with reference to the objections entertained by the members to condensation of this section with a general section on medicine

Dr Charles K Mills, Philadelphia, moved that a committee of three be appointed to prepare such resolution, same to be presented at the end of this session Motion carried

The chairman appointed as such committee Drs Francis X Dercum Philadelphia, C Eugene Riggs, St Paul, and J Ramsay Hunt New York

Dr Charles K Mills further moved that the delegate of this section Dr J H McBride, Pasadena, Calif, be added to the committee named, making four on the committee Motion carried Whereupon the chairman added Dr J H McBride to the committee as named by him

Dr Francis X Dercum, Philadelphia, read a paper on "Epilepsy with Special Reference to Treatment" Discussed by Drs George A Moleen Denver, David T Weeks Skillman N J , A L Skoog Kansas City, Mo , Francis R Fry St Louis, Charles R Ball, St Paul, William Ravine, Cincinnati, Julius Grinker, Chicago, R A Greene, Palmer Mass , James H McBride, Pasadena, Calif , Joseph M Aikin Omaha, William J Hickson, Chicago, Francis A Ely, Des Moines, Ia , I Leon Meyers, Chicago, D S Booth, St Louis, Robert McGregor, Saginaw, Mich , J Matthew Pulliam Fort Wayne Ind , R Foster Kennedy, New York, Walter Timme, New York, L Kauffman, Buffalo, and Francis X Dercum, Philadelphia

The chairman announced that the National Association for the Study of Epilepsy had sent a cordial invitation to members of the section to attend a meeting of the association at the Hotel Tuller, Friday, June 16, at 10 a m and 2 p m

Dr J Ramsay Hunt, New York, read a paper on "The Progressive Torsion Spasm (Dystonia Musculorum Deformans)" Discussed by Drs Hugh T Patrick, Chicago, E W Haass, Detroit (with exhibition of patient), A L Skoog, Kansas City, and J Ramsay Hunt, New York

Dr Hugh T Patrick Chicago, read a paper on 'The Factor of Fear in Nervous Cases" Discussed by Drs Frank P Norbury, Springfield, Ill , Harold N Moyer, Chicago, Robert McGregor, Saginaw, Mich , Walter B Cannon, Boston, Tom A Williams, Washington, D C , Walter B Swift, Boston, R Foster Kennedy, New York, Francis R Fry, St Louis, Charles R Ball, St. Paul, U G Darling, Chicago, D S Booth St Louis, and Hugh T Patrick, Chicago

Dr J Ramsay Hunt, New York, member of the committee appointed to prepare a resolution and report to the section in the matter of the proposed amalgamation of the section with the Section on Medicine, presented a report which was referred to the House of Delegates

Wednesday, June 14—Afternoon

The chairman announced that the report of committee which was presented as the last order of business at the morning session would be placed in the hands of the delegate from this section for presentation to the House of Delegates [not presented to the House of Delegates]

Dr A M Barrett, Ann Arbor, Mich, read a paper on "Syphilitic Psychoses Associated with Manic Depressive Symptoms and Course" Discussed by Drs Frank P Norbury, Springfield, Ill, Hugh T Patrick, Chicago, W F Lorenz, Mendota, Wis, Milton Board, Louisville, Ky, Julius Grinker, Chicago, and C Eugene Riggs, St Paul

Drs James B Ayer and Henry R Viets, Boston, presented a paper on "Spinal Fluid Findings Characteristic of Cord Compression," read by Dr Ayer Discussed by Drs Peter Bassoe, Chicago, Francis A Ely, Des Moines, A L Skoog, Kansas City, Ernest Sachs, St Louis, Charles R Ball, St Paul, W F Lorenz, Mendota, Wis, Charles A Elsberg, New York, and James B Ayer, Boston

Dr Morris J Karpas, New York, read a paper on "Constitutional Inferiority in the Light of Modern Conceptions" Discussed by Drs Frank P Norbury, Springfield, Ill, and Morris J Karpas, New York

Dr Lewis J Pollock, Chicago, read a paper on "Experimental Studies of Injection of the Gasserian Ganglion Controlled by Fluoroscopy" Discussed by Drs Hugh T Patrick, Chicago, Julius Grinker, Chicago, M A Bliss, St Louis, Mo, Charles R Ball, St Paul, Ernest Sachs, St Louis, George M Dorrance, Philadelphia, and Lewis J Pollock Chicago

Dr George M Dorrance, Philadelphia, read a paper on "A New Method of Injecting the Facial Nerve for Relief of Facial Spasm" Discussed by Drs Hugh T Patrick, Chicago, A L Skoog, Kansas City, Julius Grinker, Chicago, and George M Dorrance, Philadelphia

Dr William A Jones, Minneapolis, read a paper on "Myasthenia Gravis" Discussed by Drs Walter B Swift, Boston, R Foster Kennedy, New York, C Eugene Riggs, St Paul, George A Moleen, Denver, and William A Jones, Minneapolis

Drs Pearce Bailey and Walter Timme, New York, presented a paper on "A Contribution to the Pathogenesis of Progressive Muscular Dystrophy, with the Consideration of Evidence Connecting this Disease with Disturbances in the Endocrine Glands," read by Dr Timme Discussed by Drs A L Skoog, Kansas City, M A Bliss, St Louis, Lewis J Pollock, Chicago, George A Moleen, Denver, Albert E Sterne, Indianapolis, and Walter Timme, New York

Thursday, June 15—Morning

The chairman announced the appointment of Dr William A Jones, Minneapolis, on the Executive Committee, to take the place of Dr Francis X Dercum, who had found it necessary to retire, and that therefore, for the remainder of the session, papers would be approved by Dr Jones as member of the Executive Committee

The following officers were elected for the ensuing year chairman, Dr Bernard Sachs, New York, vice chairman, Dr Charles W Hitchcock, Detroit, secretary, Dr A S Hamilton, Minneapolis, delegate, Dr George A Moleen, Denver

Dr Harry H Drysdale, Cleveland, read a paper on "Conjugal Paresis Report of a Case" Discussed by Drs Julius Grinker, Chicago, J Matthew Pulliam, Fort Wayne, Ind, Lawson G Lowrey, Hathorne, Mass, C C Burlingame, South Manchester, Conn, William Ravine, Cincinnati, W F Lorenz, Mendota, Wis, Charles R Ball, St Paul, G H Moody, San Antonio, Texas, S G Burnett, Kansas City, Mo, Robert H Haskell, Ionia, Mich, George A Moleen, Denver, and Harry H Drysdale, Cleveland

Dr Henry F Stoll, Hartford, Conn, read a paper on "Syphilis as a Cause of Chronic Invalidism" Discussed by Drs W W Graves, St Louis, A L Skoog, Kansas City, William Ravine, Cincinnati, and Henry F Stoll, Hartford, Conn

Dr Walter F Schaller, San Francisco, read a paper on "The Early Diagnosis of Tabes Dorsalis"

Drs C Eugene Riggs and Ernest M Hammes, St Paul, presented a paper on "Shall We Treat the Paretic?" read by Dr Riggs

Dr Charles R Ball, St Paul, read a paper on "A Consideration of the Serobiologic Reactions after Five Years of Observation"

Dr L B Pilsbury, Lincoln, Neb, read a paper on "Mercurial Medication with Spinal Drainage"

These four papers were discussed by Drs J Henry Barbat, San Francisco, Tom A Williams, Washington, Albert E Sterne, Indianapolis, Julius Grinker, Chicago, Capt M A Reasoner, Washington, D C, G H Moody, San Antonio, Texas, Henry F Stoll, Hartford, Conn, W F Lorenz, Mendota, Wis, James B Ayer, Boston, Robert H Haskell, Ionia, Mich, M S Woodbury, Clifton Springs, N Y, George A Moleen, Denver, L C Bacon, St Paul, Walter F Schaller, San Francisco, C Eugene Riggs, St Paul, Charles R Ball, St Paul, and L B Pilsbury, Lincoln, Neb

Thursday, June 15—Afternoon

Dr Walter B Swift, Boston, read a paper on "A New Treatment of Paralysis Agitans" No discussion

Dr William Fuller, Grand Rapids, Mich, read a paper on "Necessity of Revising the Nomenclature of the Anatomy of the Brain" Discussed by Drs I Leon Meyers, Chicago, William A Jones, Minneapolis, Walter B Swift, Boston, D S Booth, St Louis, and William Fuller, Grand Rapids

Dr Tom A Williams, Washington, read a paper on "A Contribution to the Pathogenesis of the Migraines Notes Concerning a More Efficacious Treatment" Discussed by Drs J Matthew Pulliam, Fort Wayne, Ind, J C De Venney, Harrisburg, Pa, and Tom A Williams, Washington, D C

The chairman announced the appointment of Dr Ross Moore, Los Angeles, on the Executive Committee, to take the place of Dr W W Graves, who had been obliged to go away before the meeting adjourned

A vote of thanks was extended to the members of the profession of the city of Detroit for the entertainment furnished and for the comfortable surroundings in which the meeting of the section had been held

A vote of thanks was extended to the retiring chairman of the section for his efficient services in connection with the meeting, and also a vote of thanks was extended to the secretary, whose efforts had made possible the very exceptional arrangement of the program and who had secured papers exhibiting such great variety in subject and serving to maintain so much interest in the discussions

SECTION ON PHARMACOLOGY AND THERAPEUTICS

Tuesday, June 13—Afternoon

The meeting was called to order at 2 05 p m by the chairman, Dr R A Hatcher, New York

Mr M I Wilbert, Washington, D C, read a communication from the American Pharmaceutical Association moving that the members of this delegation who are not members of the Section on Pharmacology and Therapeutics be given the privilege of the floor Motion carried

He reported an application by Mr Clarence G Spalding of New Haven, Conn, a member of the American Pharmaceutical Association and endorsed by the Society of the County, and moved that it be further endorsed by the Section on Pharmacology and Therapeutics and referred to the House of Delegates Motion carried

Dr R A Hatcher, New York, then read the chairman's address entitled, "The Medical Profession and Its Duty Toward the Work on Pharmacy and Chemistry"

Dr John F Anderson, New Brunswick, N J, then read the following resolution, moving that the same be accepted and presented to the House of Delegates

Whereas, Methods for the bio assay of certain drugs are to be included in the U S P IX, although with the exception of the solution of hypophysis they are optional, and

Whereas, It is important that uniform standards be employed for such assays, therefore, be it

Resolved That the Section on Pharmacology and Therapeutics urgently recommend the House of Delegates to request the Secretary of the Treasury to authorize the United States Public Health Service to prepare and distribute for use in the bio assay of cannabis, aconite, digitalis strophanthus squill suprarenal gland and hypophysis the standards as recommended in the U S P IX

Adopted on motion of the Section on Pharmacology and Therapeutics June 13, 1916

Prof Joseph P Remington, Philadelphia, then read the address of the chairman of the delegation from the American Pharmaceutical Association No discussion

Dr Torald Sollmann Cleveland, read a paper on "The Therapeutic Research Committee of the Council on Pharmacy and Chemistry of the American Medical Association" Discussed by Drs Francis E Stewart, Philadelphia, Fred I Lackenbach San Francisco, Irvin J Moyer, Pittsburgh, Oliver T Osborne, New Haven, Conn, and Torald Sollmann, Cleveland

Dr W A Puckner, Chicago read a paper on 'The Work of the Chemical Laboratory of the American Medical Association' Discussed by Drs Francis E Stewart, Philadelphia, Prof Joseph P Remington Philadelphia, Oliver T Osborne New Haven, Conn, Fred I Lackenbach, San Francisco and W A Puckner Chicago

Mr Martin I Wilbert Washington, D C, read a paper on "Useful Drugs The Origin and Development of the Book" Discussed by Drs Oliver T Osborne, New Haven, Conn, and Noble P Barnes Washington D C

Dr F P Morgan Washington, D C, read a paper by Dr M W Glover and himself on "Some Advantages of an Authoritative Publication on the Uses of Drugs" Discussed by Drs Oliver T Osborne, New Haven, Conn, and Francis E Stewart, Philadelphia

Wednesday, June 14—Morning

The paper by Dr William Worth Hale of Boston, on "The Action of the Cinchona Alkaloids on the Uterus and Their Possible Use in Obstetrics" was read in the author's absence with the consent of the section by the secretary, Mr M I Wilbert, Washington D C. No discussion

Dr Louis A Levison Toledo, Ohio, read a paper on "The Results of Treatment in Cases of Arterial Hypertension Due to and Associated with Syphilis"

Dr Loyd Thompson, Hot Springs Ark., read a paper on "The Intensive Treatment of Syphilis"

These two papers were discussed by Drs William W Tompkins Charleston W Va Noble P Barnes, Washington, D C, Fred I Lackenbach San Francisco, A. G Shortle Albuquerque, N M, G Reese Satterlee, New York Louis A. Levison Toledo, Ohio, and Loyd Thompson, Hot Springs, Ark.

Dr D E. Drake, New Foundland, N J read a paper on "A New Development in Sanatorium Treatment"

Dr G Reese Satterlee, New York, read a paper on 'Autogenous Colon Vaccines as Used in Chronic Intestinal Toxemia, with Special Reference to Diagnosis and Therapeusis"

These two papers were discussed by Drs Ernest S Bishop, New York, Fenton B Turck, New York, and G Reese Satterlee, New York.

Wednesday, June 14—Afternoon

The secretary, Mr M I Wilbert Washington, D C., read a communication from the secretary of the American Medical Association, Dr Alexander R Craig including three applications for Associate Fellowship through the Section on Pharmacology and Therapeutics He moved that the applications if otherwise correct be endorsed by the Section on Pharmacology and Therapeutics to the House of Delegates Motion carried

Dr E L Eggleston, Battle Creek, Mich., read a paper on The Status of Physical Therapeutics in the Medical College Curriculum of Today Discussed by Drs Thomas Francis Reilly New York Noble P Barnes, Washington, D C., Walter E Simmonds Chicago, Bernard Fantus, Chicago, and E L. Eggleston

Dr A G Shortle, Albuquerque, N M read a paper on Ultimate Results in the Treatment by Artificial Pneumothorax.' No discussion

Dr Harvey G Beck, Baltimore, read a paper on "An Apparatus Designed for the Use of Partial Vacuum in Diagnosis and Treatment" No discussion

Thursday, June 15—Morning

The following officers were elected chairman, Dr A W Hewlett, San Francisco, vice chairman, Dr Arthur D Hirschfelder, Minneapolis, secretary, Mr Martin I Wilbert, Washington D C, delegate, Dr R A Hatcher, New York, alternate Dr John F Anderson, New Brunswick N J, executive committee, Drs Ray L Wilbur, San Francisco, John F Anderson, New Brunswick, N J, and R A Hatcher, New York

Dr Paul J Hanzlik, Cleveland, read a paper on "Salicylate Albuminuria" Discussed by Drs Torald Sollmann, Cleveland Ray L Wilbur San Francisco, Irwin J Moyer, Pittsburgh, and Paul J Hanzlik, Cleveland

The paper of Dr Ernest S Bishop, New York, on "The Rational Handling of Narcotic Addicts," was read by Dr Paul J Hanzlik Cleveland, owing to the indisposition of the author, who was, however, present No discussion

SECTION ON PREVENTIVE MEDICINE AND PUBLIC HEALTH

Tuesday, June 13—Afternoon

The meeting was called to order at 2 p m by the chairman, Dr William C Rucker, Washington D C

Moved by Dr H E Dearholt, Milwaukee, Wis, that Dr Charles B Johnson, Champaign Ill, be chosen delegate of this section in the House of Delegates Motion carried

Dr William C Rucker read the chairman's address on "The Health Education of the General Public.

The following papers were read as a symposium on "Health Administration

Dr Ernest C Levy, Richmond, Va "Municipal Health Administration" Discussed by Drs Guy L Kiefer, Detroit, Francis E. Fronczak Buffalo, Mr I M Rubinow New York, Drs C J Hastings, Toronto, Ont, and Ernest C Levy, Richmond, Va

Dr C. St Clair Drake, Springfield, Ill "District Health Organization" Discussed by Drs H M Bracken, Minneapolis, B Franklin Royer, Harrisburg, Pa, John N Hurty, Indianapolis, W J Denno, New York, L. R Williams, Albany N Y, and C St. Clair Drake, Springfield, Ill

Dr Watson S Rankin Raleigh, N C "County Health Organization" Discussed by Drs James Adams Hayne, Columbia, S C, H M Bracken, Minneapolis, John N Hurty Indianapolis, O B Nesbit, Gary, Ind, and Watson S Rankin, Raleigh, N C

Wednesday, June 14—Morning

The report of the Committee on Industrial Sanitation was read by Dr J W Kerr, Washington D C. It was moved that the report be received Motion carried

The following papers were read as a symposium on "Health Problems in Industry"

Dr Harry E Mock Chicago "Industrial Medicine and Surgery—The New Specialty ' Discussed by Drs Joseph C Bloodgood Baltimore, and J W Schereschewsky, Pittsburgh

A motion was carried that the section pass to the next paper, by reason of the lateness of the hour, and the two papers be discussed jointly

Dr W Irving Clark, Jr, Worcester, Mass 'Medical Supervision of Factory Employees Result of Five Years' Experience."

These two papers were discussed by Drs W H Price, Detroit, Frederick L Van Sickle, Olyphant Pa, D B Lowe, Akron Ohio, C G Farnum Peoria Ill, Charles J Hastings, Toronto Ont., Eugene L. Fisk New York, C A. Lauffer Wilkinsburg Pa, W H Lipman Chicago Harry E. Mock, Chicago, John L Burkhart Lansing, Mich, and W Irving Clark, Jr, Worcester Mass

On motion, duly carried the discussion of the various papers in this symposium was deferred until the remaining papers in this symposium were read

Dr Charles H Lemon, Milwaukee, Wis "Medical Supervision of Street Railway Employees"

Dr Carl E Smith, Akron, Ohio "Bad Teeth and Their Effect on the Workman's Efficiency"

Dr Benjamin S Warren, Washington, D C "The Relation of Health Insurance to National Health"

Mr I M Rubinow, New York "The Relation of Health Insurance to the Wage Earner"

On motion, duly carried, the time of Mr I M Rubinow, New York, in reading his paper was indefinitely extended

The chairman announced members of the Nominating Committee as follows Drs Henry M Bracken, Minneapolis, C G Farnum, Peoria, Ill, and Dr E G Williams, Richmond, Va

The papers of Dr Benjamin S Warren, Washington, D C, and Mr I M Rubinow, New York, were discussed by Drs Alexander Lambert, New York, Edwin V Delphey, New York, Benjamin S Warren, Washington, D C, and Mr I M Rubinow, New York

It was moved that the delegate of the Section on Preventive Medicine and Public Health to the House of Delegates be instructed to consider the question of a public health exhibit in connection with the next annual meeting Motion carried

Thursday, June 15—Morning

By reason of the absence of the chairman of the Nominating Committee, the election of officers was deferred

The following papers were read as a symposium on the "Sanitation of Food Supplies"

Dr Hugh S Cumming, Washington, D C "Sanitation of the Shellfish Industry" Discussed by Drs William W Ford, Baltimore, B Franklin Royer, Harrisburg, Pa, and Hugh S Cumming, Washington, D C

The report of Dr H M Bracken, Minneapolis, chairman of the Nominating Committee, was read and the following nominations made chairman Dr O P Geier, Cincinnati, vice president, Dr Ernest C Levy, Richmond, Va, secretary, Dr A M Harvey, Chicago, delegate, Dr William C Rucker, Washington, D C, alternate, Dr John N Hurty, Indianapolis, orator, Dr W S Rankin, Raleigh, N C The report was received, and the secretary cast the ballot of the section Those nominated were declared elected

Dr Robert T Legge, Berkeley, Calif, read a paper by Dr Donald B Armstrong, New York, on "Sanitation of Markets" Discussed by Drs John N Hurty, Indianapolis, John Dill Robertson, Chicago, Harold B Wood, Charleston, W Va, Mary Dunning Rose, New York, William W Tompkins, Charleston, W Va, Charles J Hastings, Toronto, Ont, and Dr Robert T Legge, Berkeley, Calif

Dr O P Geier, Cincinnati, read a paper on "Health Laboratory Organization" by William H Park, New York Discussed by Dr O P Geier

A motion that a vote of thanks be extended the retiring officers of the section was made Seconded by Drs John Dill Robertson and A E Campbell, Chicago Motion carried

SECTION ON STOMATOLOGY

Tuesday, June 13—Afternoon

The meeting was called to order by the chairman, Dr Frederick B Moorehead, Chicago

The secretary, Dr E S Talbot presented a number of applications for Associate Fellowship, and the applicants were approved

The following papers were read as a symposium on "The Principles Involved in Chronic Mouth Infections in Their Relation to General Diseases"

Dr Frederick B Moorehead, Chicago "The Prevalence of Chronic Mouth Infections and Their Management" (chairman's address)

Dr Frank Billings, Chicago "The Principles Involved in Focal Infections as Related to Systemic Disease"

Dr Ernest E Irons, Chicago "Focal Infections and Dental Disease Treatment and Results from Medical Standpoint"

These three paper were discussed by Drs Robert Hestler, Logansport, Ind, M L Rhein, New York, M H Cazier, New York, W D Caldin, Fort Wayne, Ind, G R Satterlee, New York, William C Fisher, New York, John E Nyman Chicago, William Price, Cleveland, Ernest E Irons, Chicago, Frank Billings, Chicago, and Frederick B Moorehead, Chicago

Drs M L Rhein and Arthur Black were elected members of the Executive Committee to fill the places of Drs S L McCurdy and Virgil Loeb

Wednesday, June 14—Afternoon

The meeting was called to order by the vice chairman, Dr Arthur D Black, Chicago

The following papers were read as a symposium on "Interstitial Gingivitis and Pyorrhea Alveolaris"

Dr Alexander W Lescohier, Detroit "Bacterial Findings and Their Relation to Pyorrhea Alveolaris and Interstitial Gingivitis"

Dr Hollis P Potter, Chicago "The Roentgen Ray in Diagnosis"

Dr M L Rhein, New York "The Importance of a Correct Differential Diagnosis of the Predisposing Causes in Interstitial Gingivitis and Pyorrhea Alveolaris"

Dr George B Harris, Detroit "Some Studies in the Treatment of Pyorrhea Alveolaris"

Dr Eugene S Talbot, Chicago "The Etiology and Treatment of Interstitial Gingivitis"

These five papers were discussed by Drs Arthur Black, Chicago, F D Leach, Chicago, R W Bunting, Ann Arbor, Mich, E S Talbot, Chicago, M L Rhein, New York, George B Harris, Detroit, C H Gint, Medina, Ohio, W C Fisher, New York, H E Potts, Chicago, Alexander W Lescohier, Detroit, and Hollis P Potter, Chicago

Thursday, June 15—Morning

The following officers were elected chairman, Dr Arthur Black, Chicago, vice chairman, Dr Henry Dunning, New York, secretary, Dr Eugene S Talbot, Chicago, delegate, Dr W C Fisher, New York, alternate, Dr R W Bunting, Ann Arbor, Mich

Dr C J Lyons, Ann Arbor, Mich, read a paper on "Ankylosis of the Temporomandibular Joint" Discussed by Drs H A. Potts, Chicago, and C J Lyons, Ann Arbor, Mich

Dr Jonathan W Means, Columbus, Ohio, read a paper on "A Clinical Pathologic Study of Malignant Conditions About the Face, Mouth and Jaws" Discussed by Drs Frederick B Noyes, Chicago, Herbert A Potts, Chicago, F D Leach, Chicago, Frederick B Moorehead, Chicago, and Jonathan W Means, Columbus Ohio

Dr Herbert A Potts, Chicago, read a paper on "Surgical Procedures Enhancing the Relation of Artificial Dentures, with Report and Illustrations of an Unusual Case" Discussed by Drs C J Lyons, Ann Arbor, Mich, Eugene S Talbot, Chicago, and Herbert A Potts, Chicago

Dr Frederick B Noyes, Chicago, read a paper on "A Study of the Lymphatics of the Dental Pulp" Discussed by Drs George V I Brown, Milwaukee, Wis, Arthur Black, Chicago, Eugene S Talbot, Chicago, Frederick B Moorehead, Chicago, and Frederick B Noyes, Chicago

The secretary read the name of Dr E L Singleton of Pittsburgh as an applicant for Association Fellowship His name was unanimously voted on for the consideration of the House of Delegates

SECTION ON ORTHOPEDIC SURGERY

Tuesday, June 13—Afternoon

The meeting was called to order at 2 o'clock by the chairman, Dr Russell A Hibbs, New York

Dr Russell A Hibbs, New York, read the chairman's address, entitled "The Problem of the Chronic Cripple" No discussion

Dr Robert W Lovett, Boston, read a paper on "The Treatment of Infantile Paralysis" Discussed by Drs E W Ryerson, Chicago, H W Frauenthal, New York, Frederick C Kidner, Detroit, Albert H Freiberg, Cincinnati, F J Gaenslen, Milwaukee, Wis, A L Fisher, San Francisco, James T Watkins, San Francisco, W G Stern, Cleveland, W R. MacAusland, Boston, C. A Parker, Chicago, F E

Peckham, Providence, R I , Roland W Meisenbach, Buffalo, C B Francisco Kansas City, Mo , and R. W Lovett Boston

Dr Frederick C Kidner, Detroit, read a paper on Calcified Hematoma A Study of the Pathology" Discussed by Drs W C Campbell Memphis Tenn , James T Watkins, San Francisco, J D Griffith, Kansas City, Mo , and Frederick C Kidner, Detroit

Dr Wallace Blanchard, Chicago read a paper on "Osteoclasis and Osteotomy' Discussed by Drs J Torrance Rugh, Philadelphia, Leonard W Ely, San Francisco, Roland W Meisenbach Buffalo, Edward S Hatch, New Orleans, and Wallace Blanchard, Chicago

Dr William R MacAusland, Boston, read a paper on "Astragalectomy (Whitman's Operation) in Infantile Paralysis" Discussed by Drs Frederick C Kidner, Detroit, J D Griffith, Kansas City Mo , Albert H Freiberg, Cincinnati, C M Jacobs Chicago, E W Ryerson, Chicago, W C Campbell, Memphis Tenn , R L Hull Oklahoma City , C B Francisco Kansas City Mo and William R MacAusland, Boston

Dr Walter G Stern Cleveland read a paper on "The Prognosis in Infantile Paralysis Discussed by Drs H W Frauenthal, New York and Walter G Stern, Cleveland

Wednesday, June 14—Morning

Dr Willis C Campbell Memphis Tenn, read a paper on 'Localized Osteospondylitis" Discussed by Drs F J Gaenslen Milwaukee Wis , A H Freiberg Cincinnati, Roland W Meisenbach Buffalo, J T Rugh, Philadelphia and Willis C. Campbell Memphis Tenn

Dr Arthur L. Fisher San Francisco read a paper on Syphilitic and Bone and Joint Lesions Simulating Tuberculosis" Discussed by Drs H W Frauenthal, New York, John Ridlon Chicago James T Watkins San Francisco, Edward S Hatch New Orleans, E W Ryerson Chicago, Walter T Stern Cleveland, Reginald H Sayre New York, Clarence B Francisco Kansas City Mo , Leonard W Ely San Francisco, Emil S Geist Minneapolis, H L Taylor, New York A E Horwitz, St Louis, and Arthur L Fisher San Francisco

Dr Leonard W Ely, San Francisco, read a paper on "Ankylosing Operations on the Spine" Discussed by Drs Russell A Hibbs New York Reginald H Sayre New York, James T Watkins, San Francisco, E. W Ryerson, Chicago, J Torrance Rugh, Philadelphia and Leonard W Ely, San Francisco

Dr Henry Ling Taylor, New York, read a paper on Results of Research on Conditions Affecting Posture" Discussed by Drs Joel E Goldthwait Boston, E. W Mosher, Brooklyn, Walter G Elmer Philadelphia, Roland O Meisenbach Buffalo, S A Knapp, New York, and Henry Ling Taylor, New York

Dr Melvin S Henderson, Rochester, Minn, read a paper on 'Mechanical Derangements of the Knee Joints" Discussed by Drs John Ridlon Chicago, J P Lord Omaha, Willis C Campbell Memphis, Tenn , Robert B Osgood Boston E W Ryerson Chicago, James T Watkins, San Francisco, and Melvin S Henderson, Rochester, Minn

Wednesday, June 14—Afternoon

Dr Mark H Rogers, Boston read a paper on "Sciatica An Analysis of Fifty Cases' Discussed by Drs Leonard W Ely, San Francisco, Melvin S Henderson, Rochester, Minn , Joel E Goldthwait Boston, Roland O Meisenbach Buffalo, John Ridlon Chicago J D Griffith Kansas City Mo , E. W Ryerson, Chicago, Frank E Peckham, Providence, R. I , James T Watkins San Francisco, Albert H Freiberg, Cincinnati, Reginald H Sayre, New York, A L Fisher, San Francisco and Mark H Rogers Boston

Dr E W Ryerson, Chicago read a paper on "Fat Embolism in Bone Surgery Incidence and Control" No discussion

Dr Robert B Osgood, Boston, read a paper on Orthopedic Surgery in War Time" Discussed by Drs Nathaniel Allison, St. Louis, E. W Fiske, Boston, J D Griffith, Kansas City, Mo , Joel E Goldthwait, Boston, J Torrance Rugh, Philadelphia, John Ridlon, Chicago, and Henry W Frauenthal, New York

It was moved that Dr Osgood be allowed all the time necessary to present his slides Motion carried

Drs Robert E Humphries and Henry A Durham, New York, read a paper on 'The End-Results of Tuberculosis of the Spine, Hip, Knee and Ankle Joints from the Records of the New York Orthopedic Dispensary and Hospital" Discussed by Drs John Ridlon, Chicago, Reginald H Sayre, New York, Charles M Jacobs, Chicago, and Robert E Humphries, New York

Dr Albert H Freiberg, Cincinnati, read a paper on "The Evolution of Osteochondritis Deformans Coxae Juvenilis" Discussed by Drs J R Kuth, Duluth, Minn , Frederick C Kidner, Detroit, John Ridlon, Chicago, Virgil P Gibney New York, H L Taylor, New York, and Albert H Freiberg, Cincinnati

Dr Albert Ehrenfried, Boston, read a paper on "Hereditary Deforming Chondrodysplasia—Multiple Cartilaginous Exostoses" Discussed by Drs Albert H. Freiberg, Cincinnati, and Albert Ehrenfried, Boston

Dr Charles A Parker, Chicago, read a paper on "A Plea for the Prevention of Deformities Following Burns" Discussed by Drs J P Lord, Omaha, Charles M Jacobs, Chicago, and Charles A Parker

Thursday, June 15—Morning

On motion, the reading of the minutes of the previous executive session was dispensed with, and they were referred to the Executive Committee Motion carried

The following officers were elected chairman, Dr E W Ryerson Chicago, vice chairman, Dr Robert B Osgood, St Louis, secretary, Dr Emil S Geist, Minneapolis, delegate, Dr John Ridlon, Chicago, alternate, Dr Leonard W Ely San Francisco

Dr Ely, chairman of the Committee on Tuberculosis, reported that the committee had not done its work and was not ready with a report On motion the committee was continued Motion carried

The Committee on Crippled Children, through its chairman, Dr Nathaniel Allison, St. Louis, presented a report It was not read in full, but only the concluding part, containing the recommendation of the committee This report will be sent to the Association A discussion ensued On motion of Dr Griffith, the report was received and adopted Motion carried A motion was then made that the committee formulate a resolution to be transmitted to the House of Delegates, and that the secretary be instructed to see that this was given to Dr Ridlon for presentation at once The motion was carried

The secretary made a statement concerning the proper way for those desiring to obtain copies of the Transactions to proceed He then brought up the subject of a letter that he had received, suggesting that the length of the meeting and the number of papers of the section be curtailed Dr Freiberg, in this connection, offered a resolution relative to the work of the section, which was referred to the House of Delegates

Under new business Dr Allison made a motion that a committee consisting of five members, including the chairman and Dr Goldthwait, as chairman, be appointed to consider, with the Committee of the American Orthopedic Association the best method of establishing a system of preparedness in orthopedic surgery in this country The motion was carried Dr Hess appointed, as the other three members of this committee Drs Melvin S Henderson, Robert B Osgood and Nathaniel Allison

Dr Charles M Jacobs, Chicago, read a paper on "Compression Paralysis of Pott's Disease in Adults' Discussed by Drs Henry W Frauenthal, New York, J Torrance Rugh Philadelphia, A. L. Fisher San Francisco, Reginald H Sayre New York, F J Gaenslen, Milwaukee, Wis , James T Watkins San Francisco, Edward S Hatch, New Orleans, Albert H Freiberg Cincinnati, C. M. Jacobs, Chicago and Reginald H Sayre New York.

Drs Nathaniel Allison and Herbert H Hagan, St Louis, presented a paper on "The Operative Treatment of Tuberculosis of the Spine" Discussed by Drs Fred H Albee, New York, J Torrance Rugh, Philadelphia, and James T Watkins, San Francisco

Dr John Ridlon, Chicago, read a paper on "A Report of Two Cases of Scoliosis with Pressure Paraplegia" Discussed by Drs Leonard W Ely, San Francisco, J D Griffith, Kansas City, Mo, and Reginald H Sayre, New York

Dr George W Hawley, Bridgeport, Conn, read a paper on "New Methods of Precision in the Treatment of Fractures"

Dr Frank E Peckham, Providence, R I, read a paper on "The Treatment of Some Fractures of the Femur"

These two papers were discussed by Drs Fred H Albee, New York, James T Watkins, San Francisco, J Torrance Rugh, Philadelphia, John Ridlon, Chicago, H R Allen, Indianapolis, J S A Gerster, New York, E W Ryerson, Chicago, and Frank E Peckham, Providence, R I

SECTION ON GENITO-URINARY DISEASES

Tuesday, June 13—Afternoon

The meeting was called to order at 2 15 p m by the chairman, Dr Louis E Schmidt, Chicago

Dr Victor D Lespinasse, Chicago, read a paper on "Studies in Sterility An Outline of a Method of Diagnosis and Treatment" Discussed by Drs W C Quinby, Baltimore, H L Sanford, Cleveland, A L Wolbarst, New York, Charles M McKenna, Chicago, Leland Boogher, St Louis, Granville MacGowan, Los Angeles, Louis E Schmidt, Chicago, and Victor D Lespinasse, Chicago

Drs Edward L Keyes, Jr, and David W MacKenzie, New York, presented a paper on "The Operative Treatment of Cryptorchidism" Discussed by Drs Louis E Schmidt, Chicago, Granville MacGowan, Los Angeles, and John A. Hawkins, Pittsburgh Dr Keyes showed moving pictures illustrating the operation for cryptorchidism

Dr J Bentley Squier, New York, showed moving pictures illustrating nephrolithotomy and suprapubic prostatectomy

Dr Simon Englander, Cleveland, read a paper on "Diverticulum of the Urethra" Discussed by Drs F W Robbins, Detroit, Arthur B Cecil, Los Angeles, David W MacKenzie, New York, Charles M McKenna, Chicago, and Simon Englander, Cleveland

Dr Carl C Warden, Ann Arbor, Mich, read a paper on "The Chemistry of the Gonococcus in Relation to Immunity and Therapeusis" Discussed by Drs E Schmidt, Chicago, E L Keyes, Jr, New York, Benjamin Gruskin, Chicago, Theodore Baker, Pittsburgh, John R Brown, Tacoma, Wash, Edwin Beer, New York, W Jones Wallace, Oklahoma City, Martin Krotoszyner, San Francisco, E G Crabtree, Boston, and Carl C Warden, Ann Arbor

Dr R B H Gradwohl, St Louis, read a paper on "The Hecht-Weinberg Test as a Control Over the Wassermann" Discussed by Drs M L Heidingsfeld, Cincinnati, A L Wolbarst, New York, Leland Boogher, St Louis, Carl C Warden, Ann Arbor, Benjamin Gruskin, Chicago, and R B H Gradwohl, St Louis

Wednesday, June 14—Morning

Dr Arthur B Cecil, Los Angeles, read a paper on "Reflex Urinary Retentions"

Dr Oswald W Lowsley, New York, read a paper on "Certain Obstructions at the Vesical Orifice"

These two papers were discussed by Drs H W Plaggemeyer, Detroit, H J Scherck, St Louis, Leland Boogher, St Louis, A J Crowell, Charlotte, N C, Paul M Pilcher, Brooklyn, Edward L Keyes, Jr, New York, Arthur B Cecil, Los Angeles, and Oswald W Lowsley, New York

Dr Granville MacGowan, Los Angeles, read a paper on "Cancer of the Prostate"

Drs Hugh H Young and William Frontz, Baltimore, read a paper on "Preliminary Treatment Before Prostatectomy in Unfavorable Cases"

Dr James A. Gardner, Buffalo, read a paper on "Postoperative Treatment of Patients Following Prostatectomy"

Dr J L Crenshaw, Rochester, Minn, read a paper on "Postoperative Complications Following Prostatectomy"

These four papers were discussed by Drs Paul M Pilcher, Brooklyn, A J Crowell, Charlotte, N C, William F Braasch, Rochester, Minn, Charles E Barnett, Fort Wayne, Ind, Martin Krotoszyner, San Francisco, William E Lower, Cleveland, David W MacKenzie, New York, Edwin Beer, New York, John T Geraghty, Baltimore, A W Nelson, Cincinnati, and Granville MacGowan, Los Angeles

Dr William E Lower, Cleveland, showed moving pictures illustrating suprapubic prostatectomy

Dr Edgar G Ballenger, Atlanta, Ga, showed moving pictures of various genito-urinary operations and procedures

Wednesday, June 14—Afternoon

Drs Ernest G Crabtree and Hugh Cabot, Boston, presented a paper on "Colon Bacillus Pyelonephritis Its Nature and Possible Prevention"

Dr William C Quinby, Baltimore, read a paper on "Pyelitis of Children"

These two papers were discussed by Drs Irvin S Koll, Chicago, Henry F Helmholz, Chicago, William F Braasch, Rochester, Minn, Granville MacGowan, Los Angeles, Edward L Keyes, Jr, New York, Edwin Beer, New York, E G Crabtree, Boston, and William C Quinby, Baltimore

Dr Herman L Kretschmer, Chicago, read a paper on "Hematuria A Clinical Study Based on Two Hundred Cases" Discussed by Drs William F Braasch, Rochester, Minn, Martin Krotoszyner, San Francisco, Charles M Harpster, Toledo, Ohio, R L Payne, Jr, Norfolk, Va, I Simons, Nashville, Tenn, and H L Kretschmer, Chicago

Dr John R Caulk, St. Louis, read a paper on "Ureteral Catheter Drainage in the Treatment of Renal Infections, with Special Reference to the Infected Hydronephrosis Complicating Pregnancy" Discussed by Drs Edwin Beer, New York, William F Braasch, Rochester, Minn, A J Crowell, Charlotte, N C, Martin Krotoszyner, San Francisco, Herman L Kretschmer, Chicago, F R Charlton, Indianapolis, and John R Caulk, St Louis

Thursday, June 15—Morning

The Chair announced the appointment of the following nominating committee Drs James A Gardner, Buffalo, John R Caulk, St Louis, and I S Koll, Chicago

Dr Edwin Beer, New York, read a paper on the "Surgical Therapy of Benign and Malignant Tumors of the Bladder" Discussed by Drs Edward L Keyes, Jr, New York, William F Braasch, Rochester, Minn, John A Hawkins, Pittsburgh, F R Charlton, Indianapolis, Louis E Schmidt, Chicago, Henry C Evans, Youngstown, Ohio, G Kolischer, Chicago, Frederick C Herrick, Cleveland, and Edwin Beer, New York.

Dr Gardner at this point read the report of the nominating committee, and the following officers were elected for the ensuing year chairman, Dr Hugh Cabot, Boston, vice chairman, Dr Carl Wheeler, Lexington, Ky, delegates, Dr Edward L Keyes, Jr, New York, alternate, Dr E O Smith, Cincinnati, secretary, Dr William F Braasch, Rochester, Minn

Dr Martin Krotoszyner, San Francisco, read a paper on the "Cystoscopic Diagnosis of Contracted Bladder" No discussion

Dr Henry G Bugbee, New York, read a paper on "Frequency of Urination in Women" Discussed by Drs John R Caulk, St Louis, Irvin S Koll, Chicago, A W Nelson, Cincinnati, Theodore Baker, Pittsburgh, Arthur B Cecil, Los Angeles, F R Charlton, Indianapolis, James A Gardner, Buffalo, Frederick W Robbins, Detroit, H J Scherck, St Louis, and Henry G Bugbee, New York.

Dr Daniel N Eisendrath, Chicago, read a paper on "Clinical Aspects of Ascending Renal Infection Based on Experimental Work" Discussed by Drs G Kolischer, Chicago, E O Smith, Cincinnati, Edwin Beer, New York, Irvin S Koll, Chicago, and Daniel N Eisendrath, Chicago

Dr Irvin S Koll, Chicago, read a paper on "Fat Transplantation in Renal and Prostatic Surgery" Discussed by Drs G Kolischer, Chicago, H J Scherck, St Louis, David W MacKenzie, New York, and Irvin S Koll, Chicago

Dr J Edward Burns Baltimore read a paper on "Further Observations on the Use of Thorium in Pyelography"

The discussion on this paper was postponed until the afternoon session

Thursday, June 15—Afternoon

Dr Burns' paper, read at the morning session, was discussed by Drs John T Geraghty Baltimore, William F Braasch, Rochester, Minn , Oswald S Lowsley, New York, E. O Smith, Cincinnati and J Edward Burns, Baltimore

Dr John T Geraghty Baltimore read a paper on the Role of Infection of Seminal Vesicles as a Cause of Persistent and Recurring Cystitis"

Dr A C. Stokes, Omaha read a paper on "Removal Versus Drainage of the Seminal Vesicles"

Dr Robert H Herbst Chicago, read a paper on "Seminal Vesicle Infections The Cause of Persistent Urethral Discharge Report of Cases

These three papers were discussed by Drs F O Smith Cincinnati, V D Lespinasse Chicago John R Brown Tacoma, Wash , Louis E. Schmidt, Chicago, and A C Stokes, Omaha

SECTION ON PATHOLOGY AND PHYSIOLOGY

Tuesday June 13—Afternoon

The section was called to order at 2 o'clock by the chairman, Dr F P Gay Berkeley, Calif

On account of the absence of Dr William Ophüls of San Francisco, a member of the Executive Committee, the chairman appointed Dr E P Lyon, Minneapolis, as the third member, and the Executive Committee was instructed to bring in nominations for section officers for the coming year

Dr Frederick P Gay, Berkeley, Calif., read the chairman's address, entitled 'The Infectious Diseases as a Field of Investigation in Pathology "

Dr Walter B Cannon, Boston, read a paper on "Results of Recent Studies on Some Ductless Glands'

Dr Walter W Boothby, Boston, read a paper on "The Clinical Significance of Metabolism Studies"

These two papers were discussed by Drs A J Carlson, Chicago, Emil Goetsch, Baltimore, and A J Carlson, Chicago

Dr A. J Carlson, Chicago, read a paper on "Hunger and Disease, with lantern demonstration Discussed by Drs G A. Friedman New York, Dr Walter B Cannon, Boston, A. W Cramer, and A J Carlson, Chicago

Dr H Gideon Wells Chicago read a paper on "Is Uric Acid Destroyed in the Human Body?' No discussion

Wednesday, June 14—Morning

Dr Victor C Vaughan, Ann Arbor Mich., read a paper on Additional Facts Concerning the Protein Poisons" Discussed by Drs Frederick P Gay, Berkeley Calif , R. C Brown , Milwaukee, Wis , F A Matthews Chicago, F M Pottenger, Monrovia, Calif , A. B Wadsworth, Albany, N Y , A W Crane, Kalamazoo, Mich , and Victor C. Vaughan, Ann Arbor Mich

In the absence of Dr Leila D Jackson, Chicago, her paper on "Experimental Scurvy in Guinea-Pigs Produced by Milk and Milk Products," was read by Dr J J Moore, Chicago Discussed by Drs Victor C Vaughan Ann Arbor, Mich , W W Ford, Baltimore, L R. Williams, Albany, N Y , and J J Moore, Chicago

Dr Orville T Manley, Cleveland, read a paper on "Tissue Transplantation with Reference to Permanence and Function" Discussed by Dr Robert T Morris, New York.

Dr James T Case, Battle Creek, Mich , read a paper on Roentgenologic Studies of the Gastro-Intestinal Tract in Diabetes" No discussion.

Wednesday, June 14—Afternoon

Dr Arthur H Sanford Rochester, Minn., read a paper on The Geographic Distribution of Amebiasis" No discussion

Dr Gatewood Chicago read a paper on 'Tuberculosis of the Mammary Gland No discussion

Dr Alfred S Warthin, Ann Arbor, Mich , read a paper on "Pathologic Changes in the Testes Produced by Syphilis, Leprosy, Typhoid Fever, Gonorrhea, Mumps and Roentgen Rays, with Comparative Study of These Lesions," with lantern demonstration Discussed by Drs W T Councilman Boston, Charles Koenigsberger, Lead, S D, and Alfred S Warthin, Ann Arbor, Mich

Thursday, June 15—Morning

The following officers were elected chairman, Dr James Ewing New York, vice chairman, Dr C W Green, Columbus, Mo , secretary, Dr Isabella C Herb, Chicago, executive committee, Dr William Ophüls, San Francisco, Dr A J Carlson, Chicago, and Dr F P Gay, Berkeley, Calif , delegate, Dr H Gideon Wells, Chicago, alternate, Dr Walter B Cannon, Boston

Dr James J Hogan, Vallejo, Calif , read a paper on "The Acute Delirium of Alcoholism" Discussed by Drs M H Fischer, Cincinnati, F A Matthews, Chicago, and James J *Hogan, Vallejo, Calif*

Dr Howard T Karsner, Cleveland, read a paper on "The Vascular Reactions of the Kidney in Experimental Acute Tartrate Nephritis" No discussion

Dr Arthur D Hirschfelder, Minneapolis, read a paper on "Studies on the Effects of Acids" Discussed by Dr Martin H Fischer, Cincinnati, and Arthur D Hirschfelder, Minneapolis

Dr Murlin, New York, read a paper on "The Relationship of the Stomach to the Intestinal Functions of the Pancreas" Discussed by Drs T R. Williams, Albany, N Y, and Murlin, New York.

THE REGISTRATION AT DETROIT

The total registration at the Detroit Session was 4,586 Below are given two summaries, one by sections and one by states

REGISTRATION BY SECTIONS

Practice of Medicine	1 477
Surgery General and Abdominal	1,043
Obstetrics Gynecology and Abdominal Surgery	317
Ophthalmology	301
Laryngology Otology and Rhinology	273
Diseases of Children	191
Pharmacology and Therapeutics	40
Pathology and Physiology	67
Stomatology	30
Nervous and Mental Diseases	140
Dermatology	79
Preventive Medicine and Public Health	139
Genito-Urinary Diseases	128
Hospitals	16
Orthopedic Surgery	68
Registrations without specifying any one section	277

REGISTRATION BY STATES

Alabama	5	New Jersey	24

Deaths

Frank Delos Gray, M D, Jersey City, N J, New York University, New York City, 1883, aged 58, a Fellow of the American Medical Association, president of the Medical Society of New Jersey in 1915, and formerly president of the Hudson County Medical Society, attending surgeon to Christ Hospital, Jersey City, and city physician and president of the Jersey City Board of Health, died in Christ Hospital, June 11, from the effects of a gunshot wound of the head, self-inflicted, it is believed, with suicidal intent while despondent on account of ill health

John T Montgomery, M D, Charleston, Ill, Northwestern University Medical School, Chicago, 1876, aged 63, a Fellow of the American Medical Association, a member of the Big Four Railway Surgeons Association, International Association of Railway Surgeons and Aesculapian Society of the Wabash Valley, founder and proprietor of the Charleston Sanitarium, local surgeon of the Big Four System and Mattoon and Charleston Interurban railroad, formerly president of the Illinois Fair Association, died at his home, June 14

Eligio Osuna, M D, Albuquerque, N M, School of Medicine of Nuevo Leon, Monterey, Mexico, 1891, aged 51, a Fellow of the American Medical Association, an esteemed practitioner of Albuquerque, Mexican consul in that city and a member of the Alianza Hispano-Americano, died at his home, June 2, from disease of the brain At a meeting of the Bernalillo County Medical Society, resolutions were adopted setting forth the uniform courtesy and ability of Dr Osuna and tendering the sympathy of the society to his stricken family

Willard Parker Worster, M D, New York City, College of Physicians and Surgeons in the City of New York, 1867, aged 73, a Fellow of the American Medical Association, instructor in hydrotherapy and clinical assistant in electrotherapeutics in the New York Post-Graduate Medical School and Hospital, a well-known roentgenologist, last surviving officer of the *Dunderberg*, a ram built for the United States Government by William H Webb and sold to the French Government in 1867, died at his home, June 7

Bartholomew E McKenzie, M D, Toronto, Ont, McGill University, Montreal, 1880, University of Toronto, 1889, Trinity Medical College, Toronto, 1890, aged 64, senior surgeon to the Orthopedic Hospital, Toronto, orthopedic surgeon to Grace Hospital, Toronto, and professor of clinical surgery in the Ontario Medical College for Women, Toronto, president of the American Orthopedic Association in 1905, died at Toronto, April 21, after an operation for disease of the intestines

Ernest Frothingham King, M D, Washington, D C, Howard University, Washington, D C, 1883, aged 57, a Fellow of the American Medical Association and a member of the American Urological Association, associate professor of surgery in George Washington University, Washington, D C, a specialist in diseases of the genito-urinary system, died in the Central Dispensary and Emergency Hospital, Washington, June 8, from atrophic cirrhosis of the liver

Allen Augustus Greene, M D, Anniston, Ala, Vanderbilt University, Nashville, Tenn, 1891, aged 45, formerly a Fellow of the American Medical Association, a member of the Medical Association of the State of Alabama, a specialist on diseases of the eye, ear, nose and throat, oculist to the Western Steel and Car Company and Louisville and Nashville railroad, died in St Luke's Hospital, Anniston, May 26, from heart disease

Simon Cooley Beede, M D, David City, Neb, State University of Iowa, Iowa City, 1891, aged 51, formerly a Fellow of the American Medical Association, a member of the Nebraska State Medical Association, Western Surgical and Gynecological Association and American Association of Railway Surgeons, a fellow of the American College of Surgeons, founder of the David City Hospital, died at his home, June 1

James Madison Boling, M D, Tulsa, Okla, Medical College of Georgia, Augusta, 1886, until two years ago a resident of Claremore, Okla, vice president of the Mid-Continent Trust Company, Muskogee, Okla, and a director of the Mid-Continent Life Insurance Company, a pioneer practitioner of Indian Territory, died in Barnes Hospital, St Louis, June 8

Frank Horton Foster, M D, New Carlisle, Ind, Indiana Medical College, Indianapolis, 1907, aged 45, while attempting to cross the tracks of the Chicago, Lake Shore and South Bend railroad at New Carlisle, in his automobile, June 4, was struck by an interurban car and received injuries from which he died a few hours later at Epworth Hospital, South Bend

James Elwood Stubbs, M D, Chicago, University of Pennsylvania, Philadelphia, 1864, aged 78, a member of the Illinois State Medical Society and Physicians' Club of Chicago, formerly professor of theory and practice of medicine in the Harvey Medical College, Chicago, died at his home, June 15, from cerebral hemorrhage

James Tyler Kent, M D, Stevensville, Mich, Eclectic Medical Institute, Cincinnati, 1871, Homeopathic Medical College of Missouri, St Louis, 1889, president of the Board of Trustees of Chicago Homeopathic Hospital and author of many books on homeopathic materia medica, died at his home, June 5, from nephritis

James Newton Nichols, M D, Bangs, Tex, Southern Methodist University, Dallas, Tex, 1912, aged 32, a member of the State Medical Association of Texas, for a year after his graduation an intern at St Paul's Sanatorium, Dallas, died at the family home, May 31

Francis M Lewis, M D, Little Rock, Ark., Memphis, Tenn, Hospital Medical College, 1899, aged 56, for thirty-five years a practitioner of Pulaski County, died in St Vincent's Infirmary, Little Rock, June 6, six days after an operation for appendicitis

Albert C Welch, M D, Weeping Water, Neb, University of Nebraska, Omaha, 1908, aged 62, a member of the Nebraska State Medical Association, died suddenly from heart disease while assisting in an operation near Weeping Water, June 2

Frederick Grant Bryden, M D, Morley, Colo, American Medical Missionary College, Chicago, 1901, aged 41, mine surgeon for the Colorado Fuel and Iron Company, was killed by the overturning of his automobile at Wooten, Colo, June 6

Arthur Justice Boren, M D, Byers, Kan, University of Kansas, Lawrence and Rosedale, 1910, aged 35, a member of the Kansas Medical Society, died at his home, June 3, from the effects of carbolic acid accidentally self-administered

Louis K Hirschl, M D, formerly of Davenport, Ia, University of Vienna, Austria, about 1880, aged 68, died in Bordighera, Italy, where he had practiced for thirty-five years, April 25, from kidney disease of long standing

Ida C Bender, M D, Buffalo, University of Buffalo, 1890, for thirty years a teacher of English and history in the Buffalo public schools and author of textbooks on these subjects, died at her home in Buffalo, June 11

Walter H Bills, M D, Allegan, Mich, Buffalo (N Y) University, 1870, aged 69, a member of the Michigan State Medical Society and for more than forty years a practitioner of Allegan, died at his home, June 10

Samuel Long, M D, New Brunswick, N J, Hahnemann Medical College, Philadelphia, 1873, aged 64, died at his home, June 12, from heart disease

Frank Atwater Elmes, M D, Derby, Conn, Yale University, New Haven, 1905, a Fellow of the American Medical Association, died at his home, May 20

Ira T Sage, Muncie, Ind (license, Indiana, 1899), aged 80, for many years a practitioner of Red Key, died at the home of his daughter in Muncie, May 26

William Cretcher Wren, M D, Welshfield, Ohio, Eclectic Medical Institute, Cincinnati, 1899, aged 41, died at his home from angina pectoris, May 22

Warren Carey, M D, LaGrange, Ill, Rush Medical College, 1883, aged 66, also a dentist, died at his home, June 5, from nervous breakdown

Richard Frank Delano, Providence, R. I (license, Rhode Island act of 1895), aged 54, committed suicide in his office by hanging, June 2

Dustan M Greeley, M D, Mt Carroll, Ill, Eclectic Medical Institute, Cincinnati, 1859, aged 81, died at his home, May 27

George Horton Tilden, M D, Boston, and Paris, France, Harvard Medical School, 1876, died in Paris, France, May 31

Lewis H Clark, M D, Decatur, Ill, Eclectic Medical Institute, Cincinnati, 1868, aged 71, died at his home, May 31

Sterling Triest Smith, M D, Dunlap, Tenn, University of Nashville, Tenn, 1858, aged 78, died at his home, May 21

THE WINE OF CARDUI SUIT

(Continued from page 2025)

May 11, 1916, Afternoon

ARGUMENTS ON MOTION TO INSTRUCT FOR PLAINTIFF

Mr Hough —It the Court please At this stage of the trial it becomes necessary and proper to inquire to what extent, if at all, the defendants have justified In other words whether sufficient evidence has been presented under their plea of justification to justify the submission of any question to the jury

The Court —Whether any evidence has been produced which would justify the jury in basing a verdict on it?

Mr Walker —Yes if no other was introduced

Mr Hough —I take it that we may regard as settled the law that, in an action for libel where a plea of justification is filed, and the libelous article consists of many different libelous statements it is not sufficient to aver and prove a part of those libelous statements but they must allege the truth and prove or introduce evidence which constitutes prima facie evidence of proof of every single one of those libelous statements

That is the rule as laid down in Odgers and that is the rule as laid down in Newell the two books representing the English and American law on that subject.

In other words if there are ten libelous statements in a libelous article—

The Court —I do not think you need spend any time on that. If they have not justified as to everything, then there is something where the jury must find a verdict

Mr Hough enumerated the libelous statements in the article of which complaint was made in the plaintiff's declaration and which, he said, the defendants must prove These were that the Pattens were selling and making as a tonic Wine of Cardui, which is not a medicine at all but as a booze or tipple that the women who buy it, buy it for booze and consciously or unconsciously continue to use it for its alcoholic effect that the statements on the bottles, before the passage of the Food and Drugs Act, were false and fraudulent and that the Pattens knew that they were false and that all the changes in these statements, alleged to have been false and fraudulent in the article were made because of the Pure Food Act and because the Pattens knew that they were false that all the money that they obtained, was fraudulently obtained from sickly women who thought that they were getting a bona fide medicine when all they were getting was alcohol that one of the partners of this business used the tainted money to bribe the church for a position that the plaintiffs offered their advertisements to the church publications and that they were refused because the business was dirty, vicious and fraudulent that the Pattens knew that Wine of Cardui was utterly worthless as a medicine that the method and manner of selling it was itself fraudulent that the sale of the medicine in itself was vicious, and fraudulent

'Now those in substance, are the things which must be proven or at least, concerning which sufficient evidence must be introduced to the court which would justify the submission of that question to the jury"

The arguments were long taking up the greater part of two sittings It is not possible here to do more than give the points raised and an outline of the arguments thereon with the rulings of the Court

MEDICINAL VALUE OF WINE OF CARDUI MATTER OF FACT OR OF OPINION?

The first part of the argument opened with the question whether there was, in respect of the medicinal value of Wine of Cardui, any issue of fact which could be put before the jury Counsel for the plaintiff submitted that, taking the evidence as given by the defendants' own witnesses, there was only a matter of opinion, of difference in medical opinion Counsel cited Johnson's case (*U S* v *Johnson* 211 U S 488) in which the majority of the Supreme Court held that any effort of Congress to make a question, which was founded in opinion as distinguished from fact, a matter of fraud would be unconstitutional, this case was on the Sherley Amendment and counsel cited the judgment of C J Hughes to prove the nature of the discussion that had taken place between the judges in deliberation In support of the view that there was here matter of opinion and not of fact the presence of cnicus benedictus in several official pharmacopeias and its mention as a remedy for uterine disorders in four out of forty-eight treatises perused by Professor Sollmann as well as the wide spread employment of viburnum prunifolium until quite recently, if not at present, for the same purpose, were brought forward as showing that there was still a body of opinion, however small, that cnicus benedictus and viburnum prunifolium were proper medicines to administer in these conditions It was urged that even if the plaintiffs put on the stand as many expert witnesses as had the defendant and if these new expert witnesses testified that, in their opinion, these two drugs were proper drugs to use for the complaints for which they were recommended, this would not render the plaintiff's case any stronger than it was left by the evidence of the defendants own witnesses That is to say, that the latter have given evidence that, in their opinion these two drugs as combined in Wine of Cardui, are worthless

"At most that is a question of opinion, purely of opinion, and that is what the Supreme Court has meant when it said in the Johnson case and in the McAnulty case that there could be no charge of fraud based upon any such conditions.

"If the defendants in this case had come here and said in accordance with their first analysis, 'there is nothing in this medicine but alcohol and water, and a little coloring matter' and the witnesses had said 'there is nothing in this medicine' then it would have presented a fact to have been submitted to the jury

'I say in this case that that is the duty of the Court, since it has come out from their witnesses' testimony alone, that the matter was one of opinion it is the duty of the Court to direct a verdict to the effect that there can be no charge of fraud sustained on such evidence "

The Court —Well, on that proposition I am satisfied, Mr Hough, that there is evidence in this record which would justify this jury in finding that the medicine, as described here, was worthless as a matter of fact I am satisfied on that proposition All of these expressions of opinion are to be used by the jury solely for the purpose of reaching their conclusion on the question of fact We have had evidence that this synthetic medicine was absolutely worthless that is was worse than worthless that it was harmful We have listened to that here for the last six weeks, and that is the evidence in this case and it is evidence of fact, not of opinion

When you go to the jury the question will be whether or not Wine of Cardui is worthless, or of some therapeutic value They will be required to determine between the two sets of experts, which opinion is the right opinion When they render their verdict they will decide not a matter of opinion, but a question of fact

On that proposition I am against you, Mr Hough I think there is a question to go to the jury

THE QUESTION OF FRAUD

Mr Hough read from the record the following statement of the Court

"The jury will be instructed that fraud pre-supposes knowledge on the part of Mr Patten, and that they cannot find that it is a fraud and they cannot find the truth of this plea unless they find from the evidence that Mr Patten knew that this was a fraud ' (March 28)

Mr Hough —Now there are a number of other questions in the case.

The first one is as to the fraud That involves some evidence other than evidence of the worthlessness of the medicine That requires some evidence, I say, other evidence, opinion or otherwise, as to the worthlessness of the medicine, to justify the submission, to the jury, of the question as to whether the plaintiffs knew that it was worthless

Now I say, on that point, that there is not a scintilla of evidence on which this question should be submitted to the jury

But that is not the only point in the case There is not a scintilla of evidence upon which the question can be submitted to the jury as to whether the plaintiffs in this case, the Pattens, were intentionally selling this to be consumed as a booze instead of a medicine, and that is one of the charges in this case

Now your Honor may think that the evidence as to the worthlessness of the medicine is strongly in favor of the worthlessness of the medicine as a matter of fact, as distinguished from a matter of opinion, and yet that fact alone don't justify the submission of these other questions to the jury, because those facts, alone, do not establish a condition from which the jury would be justified in inferring that they knew it was worthless in the *first place, and secondly, that* they were intentionally selling it to be consumed as booze

Now, if there is no evidence from which the jury would be justified in drawing that inference, then notwithstanding there may be evidence to go to the jury as to the worthlessness of the medicine, the jury must be instructed that they must find for the plaintiff, because a plea of justification must be a complete plea of justification, and proof of justification must be complete as to every phase of the charge

The plea of justification, as they have it in this case, is that it is *true in all its meanings, interpretations and intendments* which may fairly and reasonably be drawn from it, and that they draw all these from it, and in the argument before this court they have taken the position that that is right and that they meant all those things and they were going to prove all those things What have they done? They have merely shown, if your Honor's view of the evidence is correct, merely shown that, in the opinion of some witnesses, the medicine is worthless

That falls far short of making a prima facie case upon any of the other phases of the libel, which are just as libelous as the statement that the medicine is worthless

There is the further charge that the plaintiffs have offered their advertisements to the church publications, and that they were refused, because those in charge of them knew that the business was fraudulent and worthless

The Court —I think we have had no evidence on that

Mr Hough —No evidence whatever on that subject

The Court —As to that branch of the case, you need not go into it

Mr Hough —Now, then, there is the further charge that the women who buy this medicine don't buy it—not only that the Pattens manufacture and sell it, intending that it shall be used as a booze, and knowing that it possesses no medicinal value—but that the women who buy it, buy it for booze, and not for its medicinal value

Now I say there is no evidence which justifies the submission of that question to the jury They have brought in five or six women concerning whom it has been said that they used it in excessive quantities or that, drinking it, they got drunk on it But there is not a word in the evidence which justifies the allegation in the libel that the women who buy it—meaning all the women, not five or six out of a million or two—but all the women who buy it, buy it for booze and not for its medicinal effect

On that charge alone your Honor is justified, nay, required by the law, to charge the jury that they must find for the plaintiffs

Now there is the further charge that Wine of Cardui, when taken as recommended, is intoxicating, and your Honor's evidence on that charge is that, when *taken as recommended,* it is not intoxicating

Now I think that roughly covers all the points that I care to raise I respectfully submit that whether there is sufficient evidence to go to the jury— So that, notwithstanding your Honor may think that the evidence is strong that the medicine is worthless as medicine, there are four or five points upon which there has been an utter failure or proof, under the plea of justification

The Court —You mean not what I may think, but what I may think the evidence tends to prove

Mr Hough —I mean what you think the evidence tends to prove

At this point Mr Walker made a formal motion to put on record that the argument was to have the Court instruct the jury to find a verdict in this case for the plaintiff After asking for permission for Mr Williams of Chattanooga to be heard on behalf of the plaintiff, Mr Walker followed along the same lines as Mr Hough After counsel had spoken for some time

The Court —If I were sitting over there with eleven of my friends, I would listen to you, Mr Walker, and be impressed with the argument, but it has not anything to do with the motion to take it from the jury on that point

Mr Walker —I am arguing the proposition to the court now that there not only is not evidence in any affirmative sense to show that Mr Patten or the Chattanooga Medicine Company put this out as a booze, sold it as such, did not believe it was therapeutically a medicine, or that they ever knew anybody was using it as a beverage There is no evidence And, on the contrary, there is evidence from the plaintiff in this case to justify its use as a medicine, and their belief in it That is the reason why I am quoting that proposition

ARGUMENT OF MR C J SCOFIELD

The question before the court now on this motion to direct a verdict for the plaintiff is whether or not there is any evidence in the record at this time tending to establish the defense of justification, that is, reasonably tending to establish it If there is, of course the question would be submitted by your Honor to the jury, otherwise it would not be submitted to the jury

Now, I have nothing to say with reference to the question as to whether or not there is evidence in the record tending to show, or authorizing the jury to pass upon the question as to whether Wine of Cardui, in the doses prescribed, is worthless for the—is a worthless compound for the purposes for which it is given or intended

I take it to be established that there is sufficient evidence in the record upon that question

Now, another question that is argued by the gentlemen on the other side is the question of fraud It is alleged here in this article that this is a fraud, a vicious fraud, and it is alleged that the business has been built on deceit There are some other statements of that kind

I would say, however, first upon this question, that the question before the Court and jury at this time is the partnership case I am not here contending that the case does not have standing in this court—without the allegation and proof of special damage, but I am saying that there is no allegation of special damage, and there is no proof of any damage whatever, except what might be inferred from the fact that this statement was made concerning the corporation, and that is the situation—concerning the partnership, I mean

Then, there is a serious question—but I do not wish to argue that at this time—as to whether, under the circumstances, even if they should succeed in overcoming our plea of justification, they would be entitled in this case to any verdict at all, under any circumstances There is a serious question as to whether or not, in the partnership case, where there is no allegation or proof of special damages, even though the statements that are made in connection with one of the partners—now unfortunately deceased—would be beyond what ought to be said under ordinary circumstances, supposing that to be true, as to whether or not that can be imparted into the partnership case and made a part of the partnership case, where there is no allegation or proof of any damage whatever

I have some authorities that sustain the theory that in that kind of a case there can be no recovery But I have a very strong charge and opinion which will be presented to your Honor at some time if you should desire to see it before the case is concluded—you might have read it—in a libel case, by Lord Chief Justice Cockburn, where the very question is raised as to whether or not in a case of this kind, even though strong language is used in speaking of the medicine, or in denunciation of the corporation of persons who are putting it out upon the community—even though strong language, strong and stronger than this may be used that it is immaterial, if the principal points in the case upon the pleas of justification or privilege—privilege there, as I remember—are in favor of the defendant

Mr Scofield then addressed the Court as to whether there was any evidence to be submitted to the jury as to the knowledge of the makers and vendors of Wine of Cardui of its real character and uses He argued that, on this point, inferences are as much evidence as the facts from which the inferences are drawn This gentleman had been selling Wine of Cardui for a period of ten years and there was evidence that it was absolutely worthless From this the jury had the right to infer, if it impressed their minds in that way, that the plaintiffs knew or ought to have known of the worthlessness of Wine of Cardui

The Court —Of course, it may be, it may all be a question for the jury—it is a question for the jury, as I look at it, to determine whether or not this medicine is worthless, and on your theory, probably it would also be a question for the jury to say whether on that evidence it may or may not demonstrate to their satisfaction, that the medicine is worthless—whether, assuming it was worthless, they would hold that the Pattens knew, or ought to have known it was worthless

I would say now it is not the kind of evidence that would warrant a conviction in a criminal case

Mr T J Scofield —Now then, I take it that in this particular case if the jury should find that it was absolutely worthless—that is a question for them to decide—that under the circumstances they would have a right to say whether or not on this record, those who were making and selling it did know it, or ought to have known the facts Of course, they may not have known it I do not know what their evidence upon that point will be

Counsel further argued that the jury would have the right to consider in connection with all the evidence of knowledge and fact, that after the articles were published the plaintiffs deleted from the Ladies' Home Treatment" certain matters showing that they at this time had obtained knowledge With regard to the Methodist Church journals and advertisements of Wine of Cardui Mr Scofield cited a case in support of the view that this matter might be treated as a secondary and subsidiary matter, and if the main statement was justified, that justified the libel On the question of the use of Wine of Cardui as a tipple, Mr Scofield said

"I will just read this part of the articles 'Wine of Cardui is one of those preparations that have more or less vogue among women who take their booze in the form of patent medicine, instead of whisky' More or less vogue—that is use among women who take their booze in the form of patent medicines instead of whisky I submit that the jury has before them evidence that tends to sustain that fact."

The Court —In other words, that the phrase "more or less" means some.

Mr T J Scofield —Yes, sir I take it to be so Now, it says this "This from a gentleman who was selling to unsuspecting women an alcoholic tonic under the claim that it was non-intoxicating"

Now, if it did contain the alcohol and if it was advertised as nonintoxicating, and if he knew that it was worthless, or to have known that it was worthless as medicine, that meets the requirements of the situation

Mr Scofield laid before the Court argument that there was evidence to go before the jury on each of the other particulars

May 12, 1916, Morning

ARGUMENT OF MR. WILLIAMS FOR THE PLAINTIFF

In order that your Honor may at least see (as I hope your Honor will see) that I am not deceiving myself regarding the situation at the present time I want to concede to begin with that there is proof here that our medicine Wine of Cardui is an utterly worthless medicine, that that has been proven at this stage of the proceeding I want to concede full faith and credit to every one of the gentlemen who have been on the stand pharmacologists, physiologists and therapeutists who have testified both as to questions of fact and as to matters of opinion

I want to concede further for the purpose of this argument that everyone of the witnesses who have been introduced on what we have called perhaps jocularly 'the booze phase of the litigation," are entitled to full faith and credit, and that every circumstance that they have related here to your Honor and the jury has occurred exactly as it has been stated to have occurred

Now starting with that assumption I think perhaps I am justified in saying that we have agreed with your Honor as to what has been proved or what there has been introduced tending to prove as to both of the propositions that the medicine itself is worthless, and that it has been used in isolated cases as a booze or tipple by men and in a few instances, perhaps has been used to excess by women who have started taking it as a medicine

Now my proposition, if your Honor please, and the first proposition is that, assuming that the proof here shows as a fact at the present stage that the medicine is worthless, that it has been proved to be worthless by those pharmacological tests and these other scientific tests that have been made since the institution of this suit and many of them just before the trial of the case, it nevertheless is a fact that we cannot ignore it seems to me that by the witnessess (not the same witnesses I mean with reference to the pharmacological tests perhaps), but by the defendants own witnesses it has been proved that both of the ingredients which are used in our medicine and relied on for the medicinal effect (carduus benedictus and viburnum prunifolium) are well recognized drugs in medicine That they have been used for a great many years, as one witness said, viburnum prunifolium for one hundred years, and carduus benedictus from time immemorial almost

Counsel cited Dr Sollmann's evidence as to the use and reputation of the two drugs

Now then, may it please your Honor those facts are facts in evidence just as much as the facts regarding the pharmacological tests and the physiological tests regarding the worthlessness of the medicine

It is true it seems to me, if we had brought this suit ten years ago these witnesses, or most of them, would have been on the stand for us

But as I say that simply illustrates, may it please your Honor, the fact that there is no foundation for the charge that the manufacturers of this medicine, Wine of Cardui, are guilty of practicing a wicked and vicious fraud on the innocent women of the country because they have not known what these gentlemen have discovered in these tests made within the last few weeks, and have not known of the fact that these gentlemen, who formerly were using one of the ingredients (viburnum prunifolium) have recently, in recent years, found out regarding it and have discarded it from their practice

Assuming that, are we to be charged by a public journal, circulating all through the United States, with practicing a vicious and wicked fraud perpetrating such a fraud on the innocent women of the country because we have not known that fact and because we may be behind the times? And because we may see fit to agree with the minority of the medical profession or with the minority of the authorities on useful drugs? Is it not in testimony here your Honor, that carduus benedictus is an official drug in all the European pharmacopeias?

The Court —You may go a little further and assume that the evidence shows that at certain periods of a woman's life that not only has this medicine no effect, but it is positively harmful. Now we have such evidence here, especially in the case of a young girl and especially in the case of women with certain diseases, the symptoms of which are treated of in the "Home Treatment for Women," the "Ladies' Almanac" and also the conditions of a woman at her menopause Now if that is true, if it is a fact that Wine of Cardui is a positive detriment to the health under those circumstances then is it not a vicious fraud for somebody to advertise that it will be of benefit in those cases? And isn't the bare statement of the fact some evidence of the intent of the people who put it out?

I think there is a great deal in what you say but that is something for the jury to say, and you are making just the kind of an argument to me that I would expect to be made to the jury, analyzing the evidence and asking them the question that they must determine, whether it is a worthless medicine or whether its use will lead to the cure of these disorders, whether the Pattens had a fraudulent intent, or a malicious intent at the time they sold the medicine, and sent out the literature

Mr Williams —Is it possible for your Honor to tell the jury that it would be a reasonable inference for them to draw from the facts now in proof that we were practicing a wicked and vicious fraud instead of making an honest mistake?

The Court —Why if you assume it to be a fact that this medicine is positively dangerous (and it has been so testified here) to give it to a young girl just reaching the age of puberty then I think there is no difficulty in my mind in saying that it is a question of fact for the jury to determine here I will say that any medicine that was harmful to a young girl reaching the age of puberty, or to a woman arriving at the change of life, which was advertised to be a benefit—might it not be said that it is a vicious fraud? In other words, if it was not going to be of positive benefit, it was a fraud to advertise that it would be, especially where the evidence shows that it not only was not a benefit, but a positive harm There is evidence to that effect here

Mr Williams —If the Journal had said

"This being so, this medicine ought not to be permitted to be marketed because it contains 20 per cent of alcohol and it is dangerous for the public to have a medicine that they can go to drug stores and buy without a prescription, with 20 per cent of alcohol in it"

Now that would not have made a libel *per se*

That would not question, may it please your Honor, our intent There has got to be some proof of intent, as the Court says in the Eckman case, where it undertakes to construe the McAnulty case

The Court —I think there is no question but what there must be some basis of fact from which the jury may find the intent or may legitimately infer it Now, even in criminal cases, where the law is construed very much more favorably to the defendant, the intent is often found from the general circumstances There must in a great many cases be proof of fraudulent or malicious intent Now, in a case of this kind, if we assume that these gentlemen have told the truth and that this is positively detrimental to women at certain ages, that it cannot do anything but harm, has the jury no right to infer the intent of people who send it out under the statement that it can do nothing but good?

The Court —It is peculiar in this case that—one phase of this case—deals with one of the greatest things in the world, human life, and the positive statements are made as to what this medicine will do Now, then, assume—we may assume I think legally, that the assertion of the truth of a thing presupposes some investigation and knowledge on the part of the person who makes the assertion

Now, in the face of the assertions made here about Wine of Cardui, we have the evidence uncontradicted that, no matter what the therapeutic value of the constituent drugs that go into this Wine of Cardui may be, that at certain times in a woman's life it not only is not beneficial, or has no beneficial effect, but it is a positive harm

Now it seems to me that, under those circumstances, the jury would have a right to infer that a man who states a fact as a fact which he ought to have known was not proved—that is to say on the evidence we have here, it is so obviously false, these statements, that they ought to have known it certainly there is evidence from which the jury could find their intent

Mr Williams —But, if your Honor please, there is not a word of proof that the plaintiffs in this law suit ever heard tell of any of the circumstances or incidents that have been related here on the witness stand, and even if they had, may it please your Honor, if they had known of isolated cases in the millions of cases in which it is in proof that this medicine has been sold—if they had known of a hundred isolated cases of that kind, would it be a matter that the jury could reasonably infer that they were intentionally selling it as a booze or tipple and working it off as a medicinal compound?

This affects the personal character, your Honor, a broad statement that these people are practicing a moral turpitude, that they are doing something that is as villainous and dishonorable and unrighteous as anything that could be conceived of That is the gist of this libel

It is not the worthlessness of the medicine It is not the fact that some people may use it indiscriminately, for that may be said of any medicine that is put out to the public, whether given by doctors on a prescription or not But just as the Court says in this Eckman case, intent is a question of fact to be proved and while, of course, the jury may be justified in inferring the fact of intent from the circumstances in each particular case, the proposition here is, can the circumstances of this case warrant the jury under those circumstances in saying that these people are practicing a wicked and vicious fraud If your Honor believes that, why I agree with your Honor that it is a question to be left to the jury

The Court —I have that feeling, Mr Williams, because the evidence here is overwhelming that this medicine will not do the things that it is advertised to do It also is overwhelming that, in a great many cases, it will do a positive harm Now the jury will be safeguarded by the instructions of the Court, when the instructions are given on this question of intent, and they will be told that this amounts practically to a criminal charge in a civil case, and that they will have to find not only by the preponderance of the evidence, but by a clear preponderance of the evidence that it is true, but it is my judgment at this time that this question has got to go to the jury

This involves a scientific subject. It involves the judgment of professional men, dealing, not with everyday affairs of human life, although human life is an everyday affair, and they could not have made these statements without investigation I should say that a man who makes indiscriminate assertions, positive assertions about a medical proposition, a man of standing and position, which gives his words weight, is certainly doing a wrongful act and under certain circumstances, a fraudulent act, if he speaks otherwise Now, when these statements are made by the Chattanooga Medicine Company, the people had a right to believe that they had investigated the subject, and had consulted physicians before making the statement, and were making statements of things that they knew to be true Now the evidence shows that they not only were not true, but could not have been true in a great many instances

Mr Williams argued to some length on that point of the libel which dealt with the refusal of the advertisements in the papers of the Methodist Episcopal Church

Mr Hough —I was going to say that notwithstanding I may think the Court's mind is made up, I would not feel that I would be doing my full duty by the Court if I did not call attention to that which, in my opinion, I think has not been sufficiently presented

We may assume, for the sake of the argument, that all the libelous statements in the matter set out in the declaration are reduced to three

First, that it is a fraud to recommend that this medicine be taken by a girl at puberty, or a woman at the menopause without reference to the medicinal ingredients of the drug, because it is a positive danger to those women at that time We will say that is one distinct libel

We may assume for the sake of the argument, that evidence has been introduced, uncontradicted evidence, sufficient to submit that question to the jury even though we eliminate from our thought and our minds the fact which is also brought out, that doctors do give medicines to those women at those times which contain as much alcohol as this, and therefore, that the plaintiffs would have a right to assume that if the doctors gave medicine containing alcohol, without any danger that there would be no danger in the alcohol in their medicine, assuming that there may be valuable ingredients to the herb

But eliminating that and assuming that that has been definitely established without contradiction, and in such a way as to cause any sane or reasonable man to know that he should not recommend any medicine at that time containing alcohol, that does not dispose of the other libel, which is just as emphatically asserted in the declaration

They have stated that the alcoholic item is a minor indictment That is what the article says, that it is a minor indictment The medicine is *per se* a fraud because it does not contain any medicinal ingredients whatever

Is proof of the fact that I am doing something fraudulent in recommending a medicine for particular women sufficient proof that the medicine itself is fraudulent, or, going a step further, is it sufficient proof from which a jury would be entitled to infer that I knew the medicine was absolutely worthless for all purposes?

I say there is no evidence from which that fact should be submitted to the jury, or upon which they would be entitled to draw that inference, because the foundation for belief has been introduced by the defendants themselves, notwithstanding, they may have proven that in the opinion of other witnesses it was absolutely worthless That don't go to the essential thing which is necessary in this case, so far as the worthlessness of the medicine is concerned

But that is not all There is the statement which is equally libelous if we will assume, for the sake of argument, that both of those things have been sufficiently established to submit them to the jury, that is sufficiently established to submit to the jury the question as to whether or not it was a fraud to recommend the medicine without reference to its merits, to certain women at certain times, that is, assuming that sufficient evidence has been introduced to submit that to the jury, as to whether or not the medicine was absolutely worthless, there still remains a very serious charge upon which no evidence whatever has been introduced, and that is, that the plaintiffs in this case were knowingly selling this to be used as a booze, intending it to be used as a booze

Now, is there any evidence which can be submitted to the jury, or which should be submitted to the jury on that charge I say, not a particle

The isolated cases showing that some people have taken this for its alcoholic effec don't bring the knowledge home to the plaintiffs in the case

It is in evidence that the plaintiffs, when they took charge of the business took charge of a business the reputation of which was supposed to have been established for the purpose for which it was being sold, but that they submitted the question to one of the finest doctors and chemists in this country for the purpose of eliminating the alcohol, as far as it was possible to do so Is that to be ignored in the question of establishing good faith? There is no contradiction of that whatever

So I say that if all the other questions can be merged into the two which I have first stated there still remains this other very serious charge which has not been met in any way, and upon which no evidence has been introduced upon which a jury would be entitled to say that they knew that the plaintiffs were selling it intending it to be used as a booze, and not as a medicine

The Court —Why, if you admit that the record shows that the medicine was worthless and had 20 per cent alcohol in it, and take into consideration the enormous sales of this company it must at least have been bought for some purpose and the jury would have a right to infer that the manufacturers knew what was in it

Mr Hough —It still might have been bought for the medicinal effect because it is in evidence in this case, that alcohol itself is a medicine and there is evidence to show, or at least nothing to justify them in assuming that it was not being sold to be used for its medicinal effect

The Court —I think there is some evidence here on which the jury could assume that this was sold purely for its alcoholic content.

Mr Hough —Now then I told your Honor that the Supreme Court of the United States since the passage of the Food and Drug Act had affirmed the McAnulty case and the principles of the McAnulty case That is in the case of the Eckman Alterative Company, wherein the Supreme Court said

(Reading from citation last noted)

The Court —I have not any quarrel with that ruling, and I could not have if I wanted to, because it is the Supreme Court of the United States but if the facts are assumed, as I believe here that the evidence at the present time shows that this was absolutely worthless, and that the plaintiff ought to have known it then you come strictly within the terms of the Eckman case.

Mr Hough —Providing there is not proof going hand in hand with it, that there are others who honestly believe in the merits of the chief ingredients of this medicine Now, when that goes hand in hand with it how can it be anything but a question of opinion? At any rate, it does not lay the foundation for the charge that the plaintiffs had no ground for belief in their medicine

The Court —It depends altogether on how you look at the evidence I think there is evidence to justify the jury in assuming that very thing How they look at it, when the balance of the evidence is in, is another proposition I shall let this case go to the jury, gentlemen Do you want to go on this morning?

Mr Hough —We are ready to go on.

To which ruling of the Court the plaintiffs etc. excepted

May 15, 1916, Morning

TESTIMONY OF MR. FRANCIS P MASON

The Court met pursuant to adjournment Mr Francis P Mason was called as a witness for the plaintiff in rebuttal

DIRECT EXAMINATION BY MR. HOUGH

Mr Francis P Mason testified that he is a chemical engineer residing in Winnetka, Ill He graduated in the University of Berne, in *Switzerland. He studied three years at* the Institution St Cry, France, three semesters at the Laboratory of Prof Fresenius at Weisbaden, one semester as private assistant to Prof Fresenius, three semesters at the University of Basel in Switzerland, three and a half semesters in the University of Berne in Switzerland, where he received his doctor's degree After graduation he spent one semester at the Polytechnicum at Carlsruhe, in Germany He returned to the United States and worked in various laboratories, spending one semester at the University of Chicago, as private research chemist During the last two months he has made a series of experiments attempting to determine the potency of Wine of Cardui These experiments were made in Chicago

The witness submitted a chart showing the results of his work He took measured amounts of Wine of Cardui and evaporated them at known temperature and to a known concentration In some of these experiments he used fresh extracts and in others extracts, after standing for three days These were injected into guinea-pigs in certain doses In the first case Wine of Cardui was measured and evaporated at body temperature, or below, to a concentration where one part of the extract was equivalent to 12 parts of the original Wine of Cardui Of this extract four drops were injected into the guinea-pig He stated that the animal was made ill and showed strong nervous symptoms, lasting about an hour The animal recovered In the next experiment a guinea-pig received 5 8 drops of this same extract after standing for three days This animal was only slightly ill and recovered completely In the next case an animal was given 24 drops of the extract evaporated to a concentration of one to 4 3 This animal died in seventeen minutes In the next experiment an animal received half of the dose given to the previously mentioned animal This guinea-pig died in 29 minutes The next animal received 24 drops of a fresh extract The concentration was 7 5, and the animal died three days later Mr Mason stated that after the evaporation was completed no alcohol was left in the solution

In the next experiment Wine of Cardui was evaporated to a paste The paste was diluted in water and injected into a guinea-pig to a concentration of one to 10 7 parts of water The animal was visibly ill, but in time recovered In the next series of experiments Wine of Cardui was evaporated to dryness at 212 F The dry extract was taken up with water in concentration of one to 6.25 Eleven drops of this were administered to a guinea-pig subcutaneously without symptoms The next day the guinea-pig received 24 drops more and showed no symptoms A fresh extract was then prepared by evaporating Wine of Cardui to dryness, adding water to make a concentration of one to 16 6 of this Sixteen drops were administered to a guinea-pig and it showed no *symptoms*

Q —Now what do these experiments show doctor? *A* —These experiments show quite clearly that Wine of Cardui contains an active *potent principle That upon removing the alcohol* the extract fresh has this potency and that upon standing for a certain period of time—

Q —When removing the alcohol at what temperature? *A* —At 98 Fahrenheit, that is body temperature. Upon standing though the potency of the active part of Wine of Cardui is injured It is no longer as strong as it was when first fresh prepared.

Q —You mean when standing without any preservative? *A* —As soon as the alcoholic protection is *removed from* the Wine of Cardui it seems to undergo some definite decomposition, because as I say after standing for three days two and a half times the dose that made the guinea pig very ill when it was fresh only made it slightly ill

It is also shown here by this chart, that evaporating the Wine of Cardui to paste form at blood temperature injures it, because as will be readily seen here a dose equivalent to 260 drops of Wine of Cardui evaporated under these conditions to a paste only made the animal ill and it recovered Whereas 56 drops of Wine of Cardui—

Mr T J Scofield —I do not think he ought to argue this matter He can state what he found

Mr Hough —He is stating a fact. This is not an argument He is stating what he found

Mr Walker —And what is a fact.

Mr Hough —Go ahead.

Mr T J Scofield —I think he is giving deductions from it, and I object to it.

The Court —Overruled

To which ruling of the Court the defendants etc. excepted.

Mr Hough *Q* —State what the chart shows. *A* —It shows here in the fresh paste experiment that 260 drops of Wine of Cardui do not affect the animal as much as 56 drops do where it is evaporated only to a concentration of one to 4 and administered fresh.

The last series of experiments shows that by evaporating at 212 degrees, there is practically no potency left at all, because 270 drops of Wine of Cardui treated in this fashion show no effect, as against the 56 drops that kill

Q —That is, where you say it is evaporated to dryness? *A* —That is where it is evaporated to dryness at 212 degrees Fahrenheit.

Mr Mason stated that he purchased the Wine of Cardui in the open market He also stated—after objection which was overruled—that he had read the analysis of Wine of Cardui in THE JOURNAL of the AMERICAN MEDICAL ASSOCIATION, and it was his belief that no one could state from that analysis what the material was from which the material was made

CROSS-EXAMINATION BY MR T J SCOFIELD

Mr Mason stated that he had not studied bacteriology seriously and that he had never studied pharmacology The animals on which he experimented seemed perfectly normal and healthy They were observed by himself and a Mr Devitt, who was a chemist, not a physician or a pharmacologist The animals were purchased at an animal store and were kept about a week before the experiments were begun The animals seemed normal

Q —How do you know they were normal, that is what I am trying to get at. Do you know anything about it? *A* —I know that a sick animal exhibits without fail certain symptoms that anybody who is accustomed to handling animals can recognize

Q —Have you had much experience in experiments on guinea pigs? *A* —I had at one time

Q —When was that? *A* —When I was assistant to Professor Stupple at the University of Berne

Q —How long ago was that? *A* —The summer of 1895

Q —What experience did you have there? *A* —We were working on snake venom, trying to isolate the active principle of snake venom

Q —How many pigs did you experiment on? *A* —We used various animals, cats, guinea pigs and rats

Q —How many did you experiment on? *A* —Oh perhaps 15 or 20

Q —Were they pharmacological experiments which you were conducing? *A* —In a way, yes

Q —Who was the pharmacologist? *A* —Beg pardon?

Q —Who was the pharmacologist? *A* —Well, Professor Stupple

Q —Now then, what did you mean by saying "in a way, yes"? *A* —Well, as I remember we made between 15 and 18 experiments on this isolated venom, that is, we made various consolidations and preparations of snake venom, and tried it on animals to see if the process would be the same or would do the same work as the fresh venom would

Q —Did you isolate the active principle of the venom, doctor? *A* —No, sir, we did not.

Q —Why didn't you do it? *A* —Because it does not seem that anybody has been able to do it, or at least not at that time they had not.

Q —What was that, class work? *A* —No, I was his private assistant.

Q —In making these experiments on the guinea pigs, what did you use, what sort of an instrument? *A* —I used what is called a serum syringe, belonging to Doctor Funck.

Q —How is that? *A* —A serum syringe, a glass syringe.

Q —Produced where? *A* —From Dr George W Funck.

Q —Will you describe, if you can, the manner in which that experiment is conducted with that instrument? *A* —Why, the system was this, as used in these experiments I prepared the extracts, measured them, and Dr Funck made the actual injection in all cases, except on pigs 7 and 8

Q —Who made the injection on pigs 7 and 8? *A* —I did

Q —Was anyone with you when they were made? *A* —Yes, sir

Q —Who? *A* —Mr Devitt.

Q —Did you use the same sort of an instrument on 7 and 8 that Dr Funck used on the others? *A* —We did.

Q —How did you prepare the instrument for use on 7 and 8? *A* —It was first boiled, that is, made sterile and filled with the extract. The guinea pig had its head and front paws stuck into a wide mouthed bottle, so that its hind legs were exposed The skin of the abdomen was sterilized with alcohol, and then pinched up and the needle inserted under the flap

Q —Do you know whether or not the instrument which you used there was sterile? *A* —I just told you it was boiled

Q —How do you know? *A* —Well, it was boiled, and boiling is supposed to sterilize anything

Q —Did you do it yourself? *A* —Why, yes, right there under my supervision

Q —How long did you boil it? *A* —About five minutes

Q —Will boiling an instrument of that kind for five minutes necessarily sterilize it? *A* —I suppose it does

Q —You suppose it does I asked you if you know? *A* —I understand that it is the regular method

Q —I am asking you if you know whether or not that sterilizes it? *A* —I know what the doctors have told me, and what I have read, that is all I did not make a bacteriological—

Q —Is it not a recognized fact that an instrument of that kind, in order to be sterilized, must be boiled 20 minutes? *A* —I do not know that.

Q —I asked you if it is not a recognized fact? *A* —I do not know

Q —You do not know whether it is or not? *A* —No

Q —Those instruments were boiled five minutes? *A* —About five minutes, yes

Q —If that is true, and if it is also true, in order to have perfect sterilization, that 20 minutes of boiling is required, you don't know whether those instruments were sterile or not? *A* —If they were not sterile by being boiled five minutes, I do not know If they were sterile after being boiled five minutes, I know they were sterile.

Mr Mason testified that the instruments used were sterilized by boiling The syringe was put into the animal under the skin of the abdomen The skin was carefully sponged off with strong alcohol The hair was not shaved off It was washed until it seemed perfectly clean The alcohol was left on He stated that no examinations were made of the animal after death He personally was not competent to do it He did not see the necessity of it Neither Dr Funck nor any one else made a postmortem of the animals He does not know what was the cause of death Tetanus may have been the cause of death The witness stated that his knowledge of the matter is limited The Court called to the attention of Mr Scofield that the witness has not qualified on these lines

The witness stated that in a way when he studied chemistry he studied the question of the potency of medicine or drugs For example, he attempted to recover poisons from the bodies of rats when working under Prof Fresenius The organs were examined by various methods of analysis

The witness stated that he does not know the effects of injecting protein into the guinea-pig He does not know anything about anaphylaxis or its symptoms He does not know the composition of the extract which he injected into the guinea-pig He has not calculated the amount of extract per kilogram of weight injected He wanted to find out whether the stuff would affect a guinea-pig at all

The witness testified that the amount of extract injected into the first guinea-pig represented five drops of Wine of Cardui He was asked to calculate how much it would represent for a person 150 pounds in weight Objection was made to the question and overruled

Mr T J Scofield *Q* —Let me ask you, Mr Mason, if it is not a fact, that, figured out in that way, it would require a dose of a gallon and a half to two gallons for a man of 150 pounds, or a woman 150 pounds in weight? *A* —Of Wine of Cardui?

Q —Yes? *A* —It would be a large quantity

Mr Hough —That is objected to

Mr T J Scofield —What did you say?

Mr Hough —It is objected to as wholly immaterial, because Wine of Cardui is not given to human beings in lethal doses, and it is not intended to be given in lethal doses, and therefore it does not make any difference how much they would have to get in order to get the same action as on a guinea-pig

Mr T J Scofield —This was not a lethal dose, because it did not kill the animal

THE COURT —There are a number of experiments here where the animal was only slightly influenced

Mr Hough —The sole purpose of this was to determine that, under certain conditions, it had a marked potency and under certain conditions it made the guinea-pig very ill, and under certain other conditions it killed the guinea-pig Now they can figure out how much that might take to kill an individual, or make them sick, but that is beside the question here entirely

THE COURT —I think it is quite important We are not interested, to be sure, in the guinea-pigs that are dead any more than that this medicine did bring it about possibly But as to those that are still alive, I think it is quite competent to show what proportion of the medicine that it took to make the small animal ill, what proportion that bears to the person weighing 150 pounds say, that is, provided it appears in any way that the proportion is probably true In other words, that the same effect will happen on a guinea-pig, as will happen on a human being

Mr Hough —We are not arguing from that, that a certain amount will kill a human being

THE COURT —As I understand Dr Mason's evidence, it is merely as to one single fact, that Wine of Cardui has some potency in it, at least as far as guinea-pigs are concerned

Mr T J Scofield —Now then, let the pending question be answered, your Honor

Q—I ask you Doctor if, calculated in that way the dose for a person 1 0 pounds in weight would not be about to a gallon and a half or two gallons?

The Court—The doctor said it would be a large quantity

The Witness—It would be a large quantity I am calculating it now if you wish me to I have not got the exact figures

The witness had no information as to what was in the Wine of Cardui with which he experimented except what was on the bottle He stated that he knows it contains carduus benedictus and viburnum prunifolium from the testimony given in the trial The guinea-pigs were all females

Q—You do not know what it was that you injected that produced the illness? A—It was the active potent principle of Wine of Cardui

Q—How do you know? A—Becau —

Q—What is the active potent principle? A—The thing that makes the guinea pigs ill and kills them

Q—What is the active potent principle of Wine of Cardui? A—Chemically?

Q—Yes? A—I do not know

Q—You do not know? A—No sir

Q—Well how do you know that it is potent then? A—Because guinea pigs die from it and are made ill by it

Q—May they not die from the protein? A—I do not know anything about protein I do not know how it would affect a guinea pig

Q—Is it not a well known fact, Mr Mason that when a protein matter is injected into an animal that they frequently die? A—I do not know

Q—You do not know? A—No sir

Q—Well now suppose you injected white of egg or material of that kind into a guinea pig will it live or die? A—I never did it and I do not know

Q—You do not know do you?

Mr Hough—That is objected to as not proper cross-examination

The Court—Objection sustained

To which ruling of the Court the defendants etc. excepted

The witness stated that he conducted the work described in the laboratory of H M Dewitt in the Rookery Building

REDIRECT EXAMINATION BY MR HOUGH

On redirect examination the witness testified that the same instruments were used for the injections in each case He stated that probably if it had been an infection that caused their death it would have caused the death of all of them, but he does not know Further questions along this line were objected to Objection was sustained

The witness stated that there was no infection manifested at the point of injection

RECROSS-EXAMINATION BY MR. SCOFIELD

The witness stated that there are many kinds of infections where there is absolutely nothing to indicate it on the surface

TESTIMONY OF DR. GEORGE W FUNCK

Dr George W Funck was called as a witness for the plaintiffs in rebuttal

DIRECT EXAMINATION BY MR. HOUGH

Dr George W Funck testified that he is a physician residing in Chicago He graduated from the University of Wisconsin and then took one year's postgraduate work there. He graduated in 1903 from Rush Medical College He is now Professor of and head of the Department of Therapeutics and Preventive Medicine at the Chicago College of Medicine and Surgery He stated that in the point of students this college has as many as any in Chicago It is the Medical Department of Valparaiso University

Dr Funck testified that he had done surgery and is familiar with the female genital organs He has been teaching in various schools for about ten years and formerly held a similar position at the Bennett Medical College.

He is a member of the Chicago Medical Society, Illinois State Medical Society the American Medical Association, and the Association of Military Surgeons of the United States

There was shown to the witness the charts previously shown to witnesses who testified for the defendant. The witness stated that the charts are approximately correct, but that the uterus is exaggerated somewhat He testified that the plaster cast shown by Dr De Lee is as closely correct as any that could be made

Q—Doctor would you say that uterine displacements are pathological that are unaccompanied by any symptoms such as would cause the woman discomfort pain or distress? A—That depends largely—

Mr T J Scofield—Let me hear that

A—It depends largely on the definition of pathological If we call everything pathological that deviates in the slightest degree from the normal then of course those deviations are pathological But, in the ordinary meaning of the term pathological, as applied by physicians I would hardly say that they are unless accompanied by some other change which does produce symptoms Or we might as well further specify by saying that if the deviation from the normal is not accompanied by symptoms ordinarily speaking we could hardly figure it as pathological Strictly speaking however it would be

Q—Under the heading of uterine displacement would you include prolapsus? A—Yes sir

Q—Now are there cases of uterine displacement, including prolapsus of the womb which can be treated without surgical operation? A—Certainly

Q—What would be the symptoms of a case of that character as a rule? A—Well usually the symptoms do not refer to the displacement but rather to the congestion and inflammation that accompany the displacement and it is the congestion and inflammation that accompany the displacement that produce the symptoms

Dr Funck stated that the great majority of cases of menstrual disturbances do not require surgical treatment He stated that there are ovarian troubles which do not require surgical treatment He stated that there are a very large number of remedial agencies employed for uterine displacements which do not require surgical treatment, including cases of prolapsus

The witness testified that viburnum prunifolium is employed extensively by nearly all practitioners of medicine. On objection the answer was stricken out The witness stated that viburnum prunifolium is indicated for all cases of prolapsus and ovarian trouble which cannot be treated surgically He stated that carduus benedictus is indicated for all cases which do not require surgical treatment

Dr Funck testified that if these two drugs were combined in one medicine we would get the combined action of the two, and as their action is similar we would get the synergistic action By this he means that the sum total of the action of the two drugs is more than we would expect by simply adding the action of the two together mathematically He testified that in his opinion the combination of these drugs in a preparation of 60 grains of one and six grains of the other—the latter being viburnum prunifolium—to the fluidounce with a 20 per cent solution of alcohol is a useful combination The alcohol is a negligible quantity, and physicians do not take it into consideration at all as contained in remedial agencies Mr Scofield moved to strike out the last part of the answer The Court stated that it was not responsive, and instructed the witness to answer "yes' or "no" The witness answered that the alcohol has no part in it.

Q—How would that medicine be of benefit in the various female diseases we have referred to which would not require an operation or which are not due to malformation? A—Why by its tonic action The two do not act toxically in the same way, though but they both have ultimately that effect.

Q—What is a medicinal tonic? A—A medicinal tonic is a drug or remedial agent or process that improves and increases the vitality of the body That may be either of the entire body or it may be of particular parts of the body

Q—Can the same medicine be both a sedative and a tonic? A—Yes sir

Q—What is the difference between a stimulant on the one hand and a sedative or a tonic on the other if there is a difference? A—All three terms are different. Each one refers to a different property By a muscular stimulant we understand a drug that causes the muscle to contract more powerfully than it would otherwise if a stimulant is applied to it. The term tonic has nothing to do with the contraction of the muscle It concerns itself with the vitality of that muscle improving and increasing the vitality of the muscle.

Q—Then would you say that a tonic had to have the power of contracting a muscle in order to be regarded as a tonic? A—In fact it would not be a tonic. It would be a stimulant. The correct term for a drug having that sort of action is a stimulant, not a tonic.

Q—What connection is there between the female generative organs and the breasts of a woman? A—Through the sympathetic nervous system the two are rather intimately related. It happens quite frequently that when there is some disorder of the female pelvis that the patient will feel it in the breasts as for instance inflammations and tumors, displacements and other diseases of the female pelvis are reflected in the breast and the reverse is likewise true.

Q—Is pituitrin a tonic? A—It is a stimulant.

Q—Is hanging breasts a disease or symptoms of a disease? A—Well I should say it was rather a symptom

Q—A symptom A—Yes. sir

Q—Doctor, is medicine ever given to a woman during pregnancy? *A*—Certainly

Q—For what condition? *A*—Well, in the first place, for all the conditions that the woman may suffer from when she is not pregnant, and, in addition to that, from some of the conditions that she might suffer of because of her pregnancy

Q—Is medicine given for symptoms connected with the menopause? *A*—Yes, sir

Q—And also at puberty? *A*—Certainly

Q—Would this medicine I have referred to, in that combination, be indicated for those conditions? *A*—That belongs to the general class of remedies that are used in all these conditions

Q—Doctor, is there any danger in giving to a woman at puberty, or during the menopause, a medicine of this character, which contains 20 per cent of alcohol, in doses of a tablespoonful two or four times a day? *A*—The alcohol is the negligible quantity

Q—Will you speak a little louder, doctor? Would that amount of alcohol have the effect of arousing the passions of a girl, taken in those doses? *A*—I cannot conceive of such a thing

Q—Does a negative pharmacologic test establish the fact that a medicine is worthless? *A*—If the negative test should include every possibility, then it might, but one or two or a half dozen tests certainly would not

Q—What is the difference between a positive and a negative pharmacologic test? *A*—Well, by positive test we mean that by trying the drug on some lower animal some result is obtained, by negative test, that no result is obtained, in the particular experiment

The witness stated that a female can determine for herself that she has amenorrhea and dysmenorrhea This is true of many female disturbances She might be suspicious that she had inflammation of the womb She could certainly tell that she had leukorrhea

The witness stated that he had read through the Home Treatment Book of the Chattanooga Medicine Company for 1913 He stated that the treatment therein described including Cardui, Black-Draught, antiseptic treatment, and diet and health treatment is a general average treatment for the conditions mentioned He stated that Wine of Cardui would be a method of treating the conditions described He stated that there are some cases of sterility which can be cured by use of medicine Even all cases where medicinal treatment by mouth would be indicated would not necessarily mean that the female would be relieved of her sterility, but it would be a method of treatment that is used, and occasionally it would be successful But, even if surgical treatment would be applied to sterility, in many cases it would fail

Attorneys for the defendants moved to strike out the answer as to the surgical portion of the answer The Court ruled that it may stand

Dr Funck testified that 20 per cent of alcohol in a medicinal compound, taken in tablespoonful doses three or four times a day, would not tend to create an alcoholic habit He stated that his knowledge of carduus benedictus is based on reading concerning this drug He has never used it in his practice

Q—Doctor, would you say that the mere fact that a drug is injected into the uterus, either inside or outside of the human body, is any proof that it would or would not affect the uterus in a sick woman, when given in the usual way through the mouth? *A*—No, sir, that is not proof

Q—Would you say that the fact that a drug injected into the body of an animal shows no change in respiration, pulse or blood pressure, is any evidence that it would have no effect upon a sick woman, when given in the usual way through the mouth? *A*—No, sir, that is not evidence

Dr Funck stated that the same syringe was used on all the guinea-pigs described by Mr Mason except one He stated that there were *no* symptoms of infection in any of the guinea-pigs The site of the injection of the guinea-pigs was washed with alcohol To all appearances the guinea-pigs were normal

Q—Doctor, how might a woman tell for herself that a pain in her side, back or head was due to some menstrual disturbance? *A*—Well if it occurred periodically at her—the time of her menstruation, she probably would figure that the cause of it was the menstrual disturbance or pelvic disorder

Q—Would that be a fairly accurate diagnosis? *A*—Reasonably so

CROSS-EXAMINATION BY MR T J SCOFIELD

Q—Doctor, you are not a pharmacologist, are you? *A*—Not so far as it concerns itself with doing the actual experiments

Q—Have you had any experience with work of that kind—much? *A*—Not much, no sir

Q—How much have you had of work of that kind? *A*—Very little at the time I attended medical school, and since then, not actually doing them, but watching—not the identical experiments, but similar experiments, at the Medical College

Q—Under whom were you, doctor, at that time? *A*—At that time, if I remember correctly, the Department of Pharmacology and Physiology were conducted together

Q—Well, under what professor? *A*—That was Loeb, Dr Loeb

Q—How do you spell that? *A*—L o e b

Q—And that was where, at Madison? *A*—No, that was at Rush

Q—At Rush? *A*—However, he did not do the—there were various instructors in the laboratory He did not do the laboratory work himself

Q—I suppose he himself never gave a course in it, did he, Professor Loeb? *A*—Sir?

Q—Did Loeb give a course in pharmacology, himself? *A*—No, but if I remember correctly, it was under his—in his department.

Q—Yes Well, do you remember who the person was that was in charge of the—of that particular work, under whom you studied? *A*—No, I don't

Q—Well, it was not, as a matter of fact—what year was that that you were in that college? *A*—Well, I graduated in 1903 Then that must have been about 1901, I think

Q—Well now, is it not a fact that there was no such course in Rush Medical College at that time? *A*—Well, they had courses on lower animals, especially on frogs However, as I say, it was conducted in the department of physiology

Q—Well, I am asking you if it is not true that at that time there was not a course on pharmacology, when you were in Rush Medical College? *A*—No separate course

Q—Well now, is it mentioned at all as a course that was pursued in those years, in that institution—a study? *A*—Whether it was labeled—I don't think it was labeled, "pharmacology"

Q—Well, what was it labeled, then? *A*—It was labeled Physiology

Q—When you say "labeled" what do you mean by that? *A*—Well, I mean registered, the name that was applied to it

Q—Well have you had any experience of that kind since you commenced work for the Chattanooga Medicine Company *A*—Not aside from what was done on these rabbits, here, strictly speaking—that is not in pharmacology—or, at least, it is very crude pharmacology

Dr Funck stated that the extractives used on the guinea-pigs were prepared by Mr Mason and Mr Devitt, he merely performed the injections

The witness stated that he is not working for the Chattanooga Medical Company outside of his testifying in the trial He has been advising the attorneys for the plaintiff during the course of the trial

The witness testified that he talked with Mr Hough before the trial and before he went to Chattanooga He testified that he is on a salary with the Chattanooga Medicine Co and that he has not practiced much since the beginning of the trial His salary requires his attendance on the trial

The witness testified that he is the same Dr Funck who was employed in the defense of the Jiroch Medical Co

Q—Doctor, referring to the question—to the subject of vaginitis in women, are you familiar with the condition known as vaginitis? *A*—Yes, sir

Q—Do you agree with the statement in Cardui Home Treatment, which is as follows "The most frequent cause of vaginitis is gonorrhea" Do you agree with that? *A*—Well, that depends entirely on what statistics are taken to base that opinion upon In the—

Q—I am not asking you what they base it upon. I am asking you if you agree with that, in your views—

Mr Hough—One minute I object to the interruption of the witness Let him finish his statement

The Court—Go ahead

Mr Hough—Finish your first answer, Doctor

Mr T J Scofield—I object to Mr Hough directing the witness to do anything I am asking him whether he agrees with that statement

The Court—It depends altogether on whose heifer gets gored You object when Mr Hough is examining a witness, that he does not let him answer Now, Mr Hough objects for the same reason, that you will not let him finish

Mr T J Scofield—I was asking him—

The Court—He can finish his answer

Mr Walker—The Court said he could finish

Mr T J Scofield—Mr Walker, I am not at all deaf I recognize the Court's authority, and what he said

Mr Walker—Did you?

Mr Hough—Finish the answer you commenced

The Witness—It depends upon what statistics you take In the experience of one physician, practicing in certain places, it might be very frequent, and then again in the experience of another physician practicing among a different class of people, it might be comparatively rare You can get statistics either way

The Court—Now, Doctor—please read the question, Mr Reporter, and then let this explanation stand, but just answer the question

Mr T J Scofield *Q*—Do you agree with the statement in Cardui Home Treatment, as follows, quoting from the Home Treatment 'The most frequent cause of vaginitis is gonorrhea" Do you agree with that?

Mr Hough —Now, I object to the question, because it is not a correct statement of the Home Treatment Book It is a part of the statement And he is entitled to ask him the entire statement

(Handing book to Court.)

Mr Hough —There are a number of different causes—

The Court —Read the three lines to him, Mr Scofield I think that is proper

Mr T J Scofield —Why, surely Then I will modify the question as follows

Q —Do you agree with the statement in Cardui Home Treatment as follows The most frequent cause of vaginitis is gonorrhea brought on by infection sexual excess or unhealthy discharge from the womb ovaries, tubes or bladder? *A* —I think—

Q —Do you agree with that? *A* —In a general way yes. I think that probably most cases of vaginitis are due to some sort of discharge from the uterus

Q —What is gonorrhea? Is it a germ disease or not? *A* —It is an infection caused by a micro-organism

Q —Now then I will ask you—you agree then with that statement of the Home Treatment do you? *A* —*I don t know just exactly what* the statistics are as to the relative frequency but as a general proposition yes.

Q —I am not asking you— *A* —Especially when taken into consideration with a discharge from the uterus

Q —I am not asking you anything about statistics. I am asking you whether or not you agree that this is or is not true? *A* —The only way I can determine the relative frequency of the various causes of vaginitis is by referring to the statistics.

The Court —May I take the book Mr Hough?

Mr T J Scofield —Have you had any—

The Court —Just a minute Mr Scofield Will you be good enough to read the second paragraph there That is practically the question

(Handing book to witness.)

The Witness —There might be an objection made there to saying unhealthy discharges from the bladder probably There are not very many cases of vaginitis produced by unhealthy discharges from the bladder It is possible

Mr T J Scofield —Very well

Q —Now doctor you do agree that sometimes it comes from gonorrhea do you? *A* —Yes sir

Q —Very well Doctor Will you tell the jury your opinion as professor of materia medica and therapeutics in the Chicago College of Medicine and Surgery as to whether the use of a medicinal solution which contains the equivalent of 96 drops of whisky to each dose would be a scientific and a specific remedy with a curative effect in the treatment of gonorrheal vaginitis? *A* —It would be one of the methods of treatment and when taken along with the rest of the treatment as outlined in the Home Treatment Book it would be all right.

Q —Now then, doctor will you please answer the question I am not asking you whether it would be one of the treatments or not I am asking you whether the use of a medicinal solution which contains the equivalent of 96 drops of whiskey to each dose three or four times a day would be a scientific and a specific remedy with a curative effect in the treatment of gonorrheal vaginitis? *A* —Yes sir—the amount of alcohol we consider is—

Q —I am just asking you if you consider that is a specific and proper treatment? *A* —Yes sir

Mr T J Scofield —Well, that is all for you Dr Funck.

Whereupon the further hearing of the case was adjourned until 2 o clock p m of the same day, Monday, May 15, 1916

(To be continued)

Accident Statistics —German statistics show that from 1901 to 1911 there was a decrease in accidents causing death and partial or total permanent disability, but that there was a marked increase in accidents causing temporary disablement, lasting more than thirteen weeks The increase of accidents is particularly due to the following causes stricter control in regard to reporting accidents, employment of untrained and inexperienced workmen, more frequent prosecutions of claims by injured persons because of their better knowledge of the law, better knowledge of what is an industrial accident, increase of the cases in which the officials of the insurance system admitted a causal connection between existing malady or weakness and its aggravation by an accident, frequent granting of a transitory or accustoming pension, in cases where strictly speaking there was no longer a loss of earning power, and, finally the frequency of changes in the personnel of the laboring forces of the plants —Price, The Modern Factory

Correspondence

"Stammering" and "Stuttering"

To the Editor —May I call attention to the increase in the confusion in regard to stammering by the effort to substitute German usage (Fletcher, J M The Etiology of Stuttering The Journal A M A, April 8, 1916, p 1079) for our well established English words "stammering" and stuttering'?

Dr F A Bryant, writing under date of *1913*, says

> The Century Dictionary and Cyclopedia" explains the terms by stating that he who stammers has great difficulty in uttering anything *the result is broken and* inarticulate sounds that seem to stick in the mouth and sometimes complete suppression of voice He who stutters makes sounds that are not what he desires to make, and the result is a quick repetition of some one sound that is initial in a word that the person desires to utter, as c c c catch' *This is the attitude* taken by every writer on the subject whose views have appeared in English in the last fifty or more years with one exception

*Accurate definitions are one of the fundamentals of scien*tific investigation Let us consider briefly some of the confusion which will be caused by adopting this single exception instead of a 50-year-old rule recognized by the whole English speaking race

The German word *Stottern* is equivalent to the English word "stammering" On this account it is proposed to use the English word "stuttering" in place of "stammering" In short it is a proposal to abandon the established use of two important English words in order to use one of them in the sense of a somewhat similar German word This unreasonable proposal has already caused so much confusion that no discussion of speech defects is now clear unless it is accompanied by definitions of the words "stuttering" and "stammering"

It will take decades to make the substitution, if it can be made at all Every one who has to do with the subject must keep two meanings in mind, and even then much of what he reads will be uncertain And when the change is made, what has been written up to date will be unintelligible

A necessary consequence of this substitution of "stuttering' for 'stammering' will be the use of "stammering" with the meaning of the German word *Stammeln*, baby talk. That is, we must use a word which formerly distinctly designated a speech disorder to designate a great variety of defects in pronunciation Then lisping will be stammering, and we shall have no word for stuttering that is, clear repetition But we will have it, for stuttering is firmly fixed in the language, it is used in mechanics to designate the irregular chattering of a nonlubricated sliding member For nonspasmodic speech repetition we shall have to introduce a word, and it will always conflict with the old meaning of the word "stutter"

If America is to win any real distinction in the investigation of the leading speech disorder, it must progress at a more rapid rate than it has done, and it cannot make rapid progress by introducing a confusion of tongues

Ernest Tompkins, Los Angeles

Cataractous Families

To the Editor —Previously I have reported in The Journal seven cases that seemed to indicate hereditary tendency to cataract in some families

I operated lately on Mrs T, aged 51, for cataract in the right eye that had been forming for four or five years Recently the left eye became blind from the same cause

Just twenty-one years ago I had operated on this patient's mother, who was blind in both eyes from cataract, and who was then 54 years old Her mother, the present patient s grandmother, was blind from double cataract when she died at 65 A full cousin of the present patient, a *daughter of her* mother's sister, was blind from cataract when she died of an acute disease at 50 So this is evidently another cataractous family

* Credit allowed for years of practice

The following questions were asked

CHEMISTRY

1 Describe Marsh's test for arsenic 2 What does the presence of an abnormal quantity of chlorin in drinking water indicate? 3 To what salts do most cathartic mineral waters owe their virtue? 4 What is the chemical antidote of mercuric chlorid and what is the treatment in case of poisoning? 5 What is the chemical treatment for carbolic acid poisoning? 6 What is formed when chloral is heated with caustic potash? 7 Define valence 8 Mention six elementary substances commonly used in their pure state in medicine 9 Describe two tests for albumin in urine 10 Mention some substances used for disinfection after the prevalence of contagious diseases, and explain their action

MATERIA MEDICA AND THERAPEUTICS

1 Give the therapeutic management of acute nephritis with edema 2 Give some indications for employment of rectal alimentation, and what agents you regard as of value when thus employed 3 In what class of anemias is iron indicated? Give reason for your answer 4 Therapeutic management of acute chorea 5 Write three prescriptions each of which shall contain two or more ingredients for (*a*) 6 ounces of a solution (stimulating expectorant), (*b*) 8 powders (anthelmintic), (*c*) 8 ounces of an emulsion (50 per cent. cod liver oil) 6 Give therapeutic management of acute pyelitis in a child 3 years of age 7 Describe the physiologic action of antitoxins 8 Describe the physiologic action of vaccines, and under what conditions would you employ them 9 Give preparations and uses of ipecac 10 State the advantages and disadvantages of the use of condensed milk as a food for infants

SURGERY

1 Give the symptoms in the order of their occurrence in a case of empyema *Give your treatment of a case 2 Describe in detail a thigh* amputation at the junction of the lower and the middle third 3 Give technic for intravenous administration of salvarsan 4 Describe operation for intestinal anastomosis, illustrating, by drawing, the sutures used 5 Name the causes for gangrene of fingers and toes 6 (*a*) Give your treatment of fractures involving the elbow joint, (*b*) Why is nonunion so common in cases of fractures of the condyles of the humerus? 7 Give the diagnosis and treatment of a knee joint infected with the Neisser bacillus 8 Give your treatment of a case of cervical tubercular adenitis 9 Describe the reduction of a subcoracoid dislocation of the humerus 10 Give treatment for a burn of the second degree involving the elbow joint in a child

OBSTETRICS

1 Describe the fetal circulation and state the changes that take place after birth 2 Give symptoms of pregnancy and their relative importance 3 What is "morning sickness?" Give its etiology duration and treatment 4 How would you determine the position of the fetus previous to labor? 5 How would you manage a case of labor with the occiput in the hollow of the sacrum? 6 What is the treatment in retained secundines after abortion? 7 Give differential diagnosis of ectopic gestation 8 Give etiology, symptoms and treatment of inversion of uterus 9 What conditions justify induction of premature labor, and how is it best done? 10 What is the "Abderhalden test" and its significance?

GYNECOLOGY

1 Trace the blood and nerve supply to the uterus and appendages 2 Give the true anatomic relations of the normal uterus to the adjacent viscera 3 Describe and differentiate two benign and two malignant forms of tumor 4 What is the difference between a flexion, a version and a prolapse of the uterus? 5 Give the means of diagnosis and a description of the progress of a case of gonorrhea in the female 6 Give the technic of securing a sample of urine from each kidney separately 7 In what class of cases would you suspect a phimosis of the clitoris, and how would you relieve it? 8 How would you differentiate between a pus abscess of the tube and an extra uterine pregnancy? 9 Give in detail a recognized theory of the cause and progress of menstruation 10 What would be the indications for the removal of the ovaries, and why should we conserve in operating on them?

PHYSIOLOGY

1 What is the composition of normal blood? State its function 2 What causes the coagulation of the blood? Why does it not clot within the blood vessels? 3 State the events that occur during a complete cardiac cycle 4 What is the most plausible theory as to the cause of the heart beat? 5 What is the cause of the first respiratory movement after birth? Define the terms dyspnea, hyperpnea, apnea 6 What is an enzyme? Name five of the most important ones, giving an example of each, and their functions 7 Describe the normal mechanism *of the secretion of the gastric juice*, and state what circumstances favor gastric digestion 8 State the influence of the blood circulation on the secretion of urine Explain the effect of the division of the renal nerves on the secretion of urine 9 Describe the physiologic changes that take place in the uterine muscles during pregnancy and puerperium 10 What is the function of the thyroid gland? What effect does its removal have?

ANATOMY

1 What is the solar plexus? 2 Describe minutely the ovary 3 What is the celiac axis? 4 What muscles form the calf of the leg? 5 Give the blood supply of the appendix 6 Locate the portal vein and tell into what it empties 7 Name the different classes of joints, of bones, and give an example of each 8 Describe the greater omentum 9 Give blood supply of kidney 10 Name the muscles concerned in mastication

Washington January Report

Dr C N Suttner, secretary of the Board of Medical Examiners of Washington, reports the written examination held at Spokane, Jan 4-7, 1916 The total number of subjects examined in was 11, total number of questions asked, 110, percentage required to pass, 75 The total number of candidates examined was 29, of whom 22 passed, including 1 osteopath, and 7 failed, including 3 osteopaths and 1 chiropractor The following colleges were represented

Miscellany

Coffee Substitutes and Modified Coffees

The extensive use of coffee and the injurious effects attributed, in certain cases at least, to some of its constituents (caffeol, caffetannic acid and caffein), make the subject of coffee substitutes and "hygienic coffees" one of considerable importance John Phillips Street, in a recent article (Coffee Substitutes and Hygienic Coffees, *Mod Hosp*, May, 1916, p 330), gives the results of analysis of a number of such preparations None of the coffee substitutes examined contained coffee In some of the specially prepared coffees, however, wide differences were found between the claimed and the actual composition Street's standard of comparison was a sample of commercial Java coffee, which was found to contain 1 2 per cent caffein and 11 37 per cent caffetannic acid One brand (Granger's Fairy Cup Instant Soluble Coffee) from which, it is claimed, "nearly all the caffein and tannic acid is discarded," was found actually to contain 4 48 per cent caffein and 45 48 per cent of caffetannic acid—about four times as much as the amount found in the ordinary Java coffee examined! Similar percentages (4 96 per cent caffein and 48 04 per cent caffetannic acid) were found in G Washington Prepared Coffee, from which, it is claimed, "Mr Washington's refining process eliminates these harmful, indigestible substances" A slightly smaller caffein content than that of ordinary coffees was found in two brands (Hansley and Kinsella's Vacuum Coffee and Cafe des Invalides), the diminution of caffein in the latter case being due to the presence of 20 per cent chicory and other vegetable matter The claims for one brand (Richelieu Vacuum Coffee) are based on the removal of "caffeotoxins," including caffeol, which is alleged by the promoters to be the source of the deleterious effects of coffee Street is inclined to doubt the importance of caffeol In caffein and caffetannic acid content, this brand of coffee does not differ materially from the ordinary commercial Java Kaffee Hag contains 0 03 per cent caffein and 11 47 per cent caffetannic acid, which agrees with the claim that 95 per cent of the caffein is removed [Street apparently did not examine Dekafa, one of the earliest caffein-poor coffees, which was shown by the Chemical Laboratory of the American Medical Association (Dekofa, A Caffein-Poor Coffee, The Journal A M A, July 1, 1911, p 37), to contain about 0 13 per cent caffein —Ed]

Control of Tuberculosis in Victoria

In an address before the North Atlantic and New York State Conferences on Tuberculosis in November, 1915, Dr Victor G Heiser spoke of the results of efforts to control tuberculosis in Victoria, Australia, which country he had recently visited He believes that the United States has something to learn from the Australian state in regard to tuberculosis He said that the death rate for the whole of Australia is 8 per thousand This might be accounted for partly by reason of the fact that the people come to that country in the prime of life and that the birth rate is low, which would give a low death rate The figures for fifteen years, however, show that the rate has slowly but steadily declined to the figure named He was informed that every patient with tuberculosis in Victoria had been isolated The enforcement of this, as well as other laws, is strict At first in the effort to isolate tuberculosis cases, force was used, but this did not work well, and then a fee of $2 50 was paid to physicians for reporting the cases, which secured their cooperation After the cases were reported it was not difficult for the authorities to follow them up The patient in each instance was visited and given the choice of isolation in his own home, provided he rigidly carried out the regulations of the health authorities Inspections were made frequently to see that they were complied with If compliance was not satisfactory, then, without the consent of the patient, he was removed to a sanatorium where he was kept until no longer a menace to any one else Although the state is anxious to have immigrants, every one must undergo a severe physical examination before being allowed to enter the country, and in this strict attention is paid to tuberculosis In London a station is maintained for the examination of prospective immigrants before embarkation In this way the state provides against reinfection Dr Heiser says that he has recently been informed that these measures have resulted in the disappearance of the disease from Victoria

Accident Safeguards and Compensation in the Federal Service

The recent accident on a submarine in the Brooklyn Navy Yard, by which three men were killed and six seriously injured among the civilian employees, according to the *Survey*, should call attention to the inadequacy of safeguards provided by the federal government for the prevention of accidents and occupational diseases among its civilian employees It is said that it has been agreed for years by informed persons, including the administrative officials at Washington, that the federal compensation law of 1908 is inadequate Only one quarter of the government's 400,000 civilian employees are covered, and the maximum compensation allowed in case of a fatal accident is one year's wages As some of the men in the Brooklyn accident were receiving $2 a day, their widows would receive only $600 or $700 for the loss of their husbands The government makes no allowance for burial expenses or for medical treatment, and the victims of the submarine accident are being cared for in a Brooklyn hospital at the expense of the citizens of New York The federal compensation law has been condemned by the United States Bureau of Labor Statistics and by the American Federation of Labor, as well as by many organizations of civil service employees The Kern-McGillicuddy compensation bill for injured employees of the federal government, drawn by the American Association for Labor Legislation, said to be based on the best experience of American states and foreign countries, has been before Congress for three years, and although reported favorably by the judiciary committee, has not had congressional approval It would seem that the government should set a good example by leading rather than lagging behind the states in so important a measure

Fatal Mushroom Poisoning at First Presumed Arsenical

A dish of cooked mushrooms was eaten by Q—— about 6 p m, October 4 An agitated night followed, then, at 5 30 a m, diarrhea and colic and three stools in one hour, later nausea and vomiting, rigors and sensation of cold Burning sensation from throat to intestine was now complained of, then came cramps in the legs, continuous diarrhea and vomiting, with intolerance of all liquids Treatment calmed the vomiting, but the diarrhea increased to ten and even fifteen stools in the hour An attack of syncope occurred at 5 p m and another during the night The next day, October 6, the symptoms persisted and on the morning of the 7th, sixty hours after the onset, death occurred On postmortem examination there were found intense inflammation and congestion of the whole alimentary tract below the cardiac orifice The stomach contained one-third liter (about 12 ounces) of chocolate colored fluid, the intestines were empty, the liver was enlarged and somewhat yellowish, the kidneys showed congestion and punctate parenchymatous hemorrhages Poisoning by arsenic or some similar irritant being suspected, Leon Garnier analyzed the organs for arsenic and mercury The result was negative The mushrooms were not suspected because a number of other persons had eaten from the same dish The negative result of the analysis, the long incubation period (eleven hours) during which the deceased suffered from headache, etc, the fact that diarrhea preceded the vomiting and the whole course of the case point to poisoning by phallin This is one of the active principles of the amanitas, and being thermostabile it is not destroyed by cooking There can be little doubt that the deceased was unfortunate enough to eat the only fragment of amanita there was in the dish Amanitas are responsible for practically all the mushroom poisonings in France—Leon Garnier, *Ann d'hyg pub*, 1914, p 85

Medicolegal

Upholds Law Against Guaranteeing to Cure Incurable Diseases — Procedure

(Freeman vs State Board of Medical Examiners (Okla), 154 Pac R 56)

The Supreme Court of Oklahoma affirms a judgment sustaining the action of the board in ordering that the license of R. W Freeman as a physician be revoked for unprofessional conduct. The court holds valid the provision of the Oklahoma statutes which defines "unprofessional conduct" of a physician as "the obtaining of any fee on the assurance that an incurable disease can be permanently cured" In the case of *Graeb vs State Board of Medical Examiners* (55 Colo 523, 139 Pac 1099), the only case found passing directly on this point, a majority of the Supreme Court of Colorado held a similar statute to be too indefinite and uncertain to be valid The only difference in the two statutes was that the Colorado statute had the words 'manifestly incurable' instead of the word "incurable," but this is not regarded as affecting the applicability of the decision, since it is held in it that the words "manifestly" and "incurable" must be taken as applicable to the disease per se or in and of itself and not to the condition of the patient suffering with the disease at the time his treatment is undertaken by the physician However, the Supreme Court of Oklahoma thinks that the majority opinion of the Colorado court does not rightly construe the statute, and it prefers to follow the dissenting opinion in that case, as it thinks the dissenting opinion correctly interprets the statute, and that such interpretation is equally applicable to the Oklahoma statute As this court regards the Oklahoma statute, it thinks that it is not aimed at any unethical practices of physicians as interpreted by the medical fraternity, but was aimed to prevent acts on the part of physicians which are universally regarded as immoral and against good conscience, not only by the medical profession, but by laymen as well, and for which under the style of obtaining money under false pretenses the Oklahoma criminal code has provided the penalties of the law The word "incurable" in the statute is to be interpreted in its ordinary acceptation, it must be deemed that the legislature did not intend to do a useless thing, but intended the statute to be enforced in accordance with an interpretation based on the ordinary understanding of the words used, both by laymen and by physicians In that view of the case, the court is clearly of the opinion that the words "incurable disease" in the statute apply to the state of the disease which a patient may have at the time the treatment of it is undertaken by the physician, and that, if a physician undertakes to treat a patient who is suffering from a disease which has in its progress reached an incurable state according to the then general state of knowledge of the medical profession, and accepts a fee from the patient on the assurance that he can effect a permanent cure of such disease, he would be guilty of unprofessional conduct as defined by the statute In this case there was introduced in evidence the following writing "Absolute Guarantee. "———Okla, ———, 191— I, R. W Freeman, M D, party of the first part, do hereby agree to refund all moneys paid to me by H S Hawkins, party of the second part should he fail to receive a complete cure by my treatment R W Freeman" Below this Hawkins signed an agreement to follow the directions given by Freeman "through a period of time sufficient as deemed by him to effect a complete cure," or the agreement should become void It was claimed that this was not a guaranty of a cure, but the court declares it was a subterfuge which held out to the patient an assurance of a permanent cure The state board of medical examiners in a proceeding before it to revoke the license of a physician acts in an administrative, and not a judicial, capacity, and it is sufficient if the accused is informed by the complaint of the wrong charged against him and the particular instances of its perpetration charged, and has an opportunity to defend against proof of such charges and the proceedings are free from prejudice, fraud or oppression.

Admissible Evidence to Explain Roentgenograms

(Virginian Railway Co vs Bell (Va), 87 S E R 570)

The Supreme Court of Appeals of Virginia reverses a judgment obtained by plaintiff Bell, a railway mail clerk who claimed to have been struck by a sliding door to a car in which he was at work, fracturing the transverse process of the third cervical vertebra The court holds that there was error in refusing to permit a Dr Gray, an eminent Roentgen-ray specialist of large experience, to exhibit to the jury a roentgenogram taken by him showing a man's neck in normal condition The court says that the plaintiff had produced in evidence two Roentgen-ray plates of the plaintiff's neck taken by a Dr Brady, a physician of high professional standing but of limited experience as a Roentgen-ray specialist These plates would doubtless have been meaningless to the jury without explanation, but as explained and interpreted by Dr Brady they showed a fracture, and they went to the very heart of the case on the question of extent of damage If Dr Brady's interpretation of these pictures was correct they were decisive of the vital and controverted question as to whether certain bones in the plaintiff's neck were broken His attending physician did not suspect a fracture until after these pictures of his neck were taken and were said by Dr Brady to show that a fracture had been sustained Dr Gray testified that the pictures did not support Dr Brady's interpretation, and stated that he could demonstrate that fact from the pictures themselves, by showing to the jury a picture which he had taken of a man's neck in a normal condition It was claimed for the plaintiff that it was proper to exclude the latter picture because to permit a comparison of the plaintiff's neck with other necks would lead to confusion and irrelevancy It is difficult to see how this contention can be maintained The very relevancy and probative value of the roentgenograms of the plaintiff's neck depended on the correctness of a presumption that as a rule and until the contrary appears every man's neck is normal, and that the general form and structure of every human neck is the same Otherwise, Dr Brady's pictures, which were offered to show an abnormal condition, proved nothing So too as to a skeleton the plaintiff introduced to show, by way of illustration and comparison, all the bones involved when in normal condition and to give the jury an idea of their general formation and structure The court thinks it was clearly proper to admit the skeleton to show a normal neck in contrast with the abnormal one which it was claimed Dr Brady's picture showed and that on the same considerations it was improper to exclude the roentgenographic plates offered by Dr Gray which he said would enable him to demonstrate that Dr Brady's roentgenograms did not disclose any fracture The Roentgen-ray process is comparatively new, and is more or less occult, certainly to the lay mind The plaintiff was properly given a free hand in developing the proof of his injuries by means of the roentgenographic pictures and an expert explanation of them and similar freedom should have been accorded the defendant in testing before the jury the correctness of that explanation.

Employment of Physician by Superintendent

(Indiana Die Casting Development Co vs Newcomb (Ind), 111 N E R 16)

The Supreme Court of Indiana affirms a judgment for $371 in favor of plaintiff Newcomb on an alleged contract entered into between him and the defendant company by its superintendent, for the care and treatment of an employee who was injured by an explosion of molten metal and suffered injury to his eyes The Court says that some evidence was admitted relating to certain customs prevalent in the city of Indianapolis as to corporations, other than the defendant, employing physicians to treat injured employees This would be error, which would require a reversal of the judgment, did it not affirmatively appear from the record that the admission was harmless Other evidence complained of related to the manner and custom of the defendant in doing its business and was to the effect that the board of directors very seldom met, that the whole management of the corporation developed on the superintendent, who owned 40 per cent of the stock, that when any matters arose pertaining to the management of its affairs, he would consult the directors individually, and follow their advice It was contended by the defendant that without a regular meeting of the directors no authority could be given the manager to employ a physician, and without an order so made the superintendent could not bind his corporation, and that therefore the defendant was not liable for the services rendered by the plaintiff at the solicitation of the superintendent, regardless of the custom But it was proper to admit this evidence Moreover, in addition to proving the custom of the defendant in the management of its business, it was shown that in this particular instance the superintendent did consult individually a majority of the directors in relation to the employment of the plaintiff, and that no objections were interposed by any of said directors as to what had been done by the superintendent in employing the plaintiff, and after so consulting his fellow directors the superintendent again directed the plaintiff to proceed with the treatment of the case It was further shown that this had been the custom of the defendant theretofore, and that it had paid bills for services similarly contracted for by said superintendent The trial Court, in finding generally for the plaintiff found that the defendant had ratified the acts of its officers in entering into the contract, and the Supreme Court believes it was a just conclusion

Treating Case as One of Appendicitis Instead of Ptosis—Evidence

(Stout vs Bowers et al (Kan), 154 Pac R 259)

The Supreme Court of Kansas reverses a judgment entered on a verdict directed in favor of the defendants, who were sued for alleged malpractice in diagnosing the plaintiff's ailment as appendicitis, and operating on her therefor, when what ailed her was a condition of ptosis or falling of part of the intestines, which should have been tacked up and otherwise remedied The Court says that it was true, as the defendants contended, that they could not be held liable if it appeared that they possessed a reasonable degree of skill and learning in medicine and surgery, and that they used ordinary skill and care in the diagnosis, operation, and treatment of the plaintiff Much testimony of an expert character was produced as to the professional skill of the defendants, and which tended to prove that the operation was properly performed, and further, that an operation for ptosis of the bowels was not approved surgery, and was not warranted in the plaintiff's case On the other hand, if testimony was produced by the plaintiff which fairly tended to prove the essential facts stated in her petition as to the defendants' negligence, although it may have been weak and inconclusive as compared with that produced by the defendants, the ruling directing a verdict in favor of the defendants could not be upheld If the defendants' demurrer to the plaintiff's evidence could not be sustained, a verdict against her could not be directed, because of conflicting evidence subsequently produced in behalf of the defendants Her case might have been strengthened by the testimony offered in their behalf, but on their motion to direct a verdict in their favor the prima facie case made by her testimony could not be weakened or destroyed by theirs The fact that her testimony was opposed by much that was given by physicians of larger experience was no reason for taking the case from the jury And the mere fact that the physician who testified in behalf of the plaintiff was led to say, in answer to one question on cross-examination, that the defendants made a mistake of judgment, and may have acted according to their best judgment, did not destroy the testimony tending to show that the defendants failed to use reasonable and ordinary care in the case The plaintiff complained that she was not allowed to show the conditions developed by a subsequent operation and the fact that it resulted in effecting a cure While the plaintiff might have given testimony as to some of the palpable facts, she was not qualified to testify as to the skill exercised in that operation, no more than in the one performed by the defendants It was competent for her to state any manifest conditions observable by any one, but only witnesses having special skill and knowledge were competent to testify as to her ailment, or as to what was required in the way of surgery or treatment However, it would seem that one having special skill and training might give testimony as to the conditions existing at the time of the different operations on the plaintiff, the treatment required, and the effects resulting from the operations Where an expert witness testifies, and founds his opinion on standard medical authorities, it is competent for the opposing party, in cross-examining him, to read from the authorities, and to ask him if he agrees or disagrees with the opinions expressed by the authors

What Constitutes "Consulting a Physician"—"Good Health"

(New York Life Insurance Co vs Franklin (Va), 87 S E R 584)

The Supreme Court of Appeals of Virginia says that the insured in this case made application, about the middle of June, for the reinstatement of a policy which had elapsed for a nonpayment of premium due on May 2 To the question as to what physicians he had consulted since the date of the policy, he answered "None" And the question, Are you now in sound health? he answered, "Yes" It appeared, however, that on the 4th of April a physician examined him and found evidences which caused him to suspect nephritis This examination was made at the request of the man's wife, who had telephoned to the physician that her husband was not well and requested that he arrange an interview with him, which he did by telephoning to him and having him come and submit to an examination It did not appear that the physician advised the insured as to the probable consequences of the disease which he suspected The examination was only partial It was not certain that he then had the disease He declined to be treated, and left the impression on the physician that he did not think he was sick He died on July 17 of a complication of diseases, one of which was nephritis It was contended, on the one hand, and denied on the other, that what occurred between the insured and the physician amounted to "consulting a physician" within the meaning of the question and answer appearing in the application for reinstatement The Court holds that there was no error in an instruction which told the jury to find for the plaintiff, if they believed from the evidence that the company accepted the application for reinstatement and executed its receipt for payment, unless they believed that it had been proven by a preponderance of the evidence that the answers in the application were wilfully false or fraudulently made Under the rule adopted in Virginia and supported by what seems to the Court to be the better considered authorities from other jurisdictions, "consulting a physician," within the meaning of an application for life insurance, depends on the character of the interview This rule finds its foundation in the favorable construction always accorded to the insured, and the generally recognized principle that good faith and substantial truth are all that can be required of the insured in applications for insurance If, therefore, it could be regarded under the evidence as beyond fair debate that the insured understood from the physician that his symptoms were serious and indicated a malady which involved real impairment of his health or might affect his longevity, then, as a matter of law resulting from this undisputed fact, this Court could say, and the lower Court should have said, if asked to do so, that there could be no recovery But in the state of the evidence on this point the Court thinks the question was one for the jury to determine As to the import of the words, "sound health," the Court refers to what it says in Greenwood vs Royal Neighbors of America, 87 S E R, 581, decided at the same time with this case There it says that the phrase "good health," as used in its common and ordinary sense by a person speaking of his own condition, undoubtedly implies a state of health unimpaired by any serious malady of which the person himself is conscious When one says he is in *good health*, he does not mean, and nobody understands him *to mean*, that he may not have a latent disease of which *he* is wholly unconscious The mere statement by a party *that* he fully warrants himself to be in good health is not sufficient to take the expression out of its common meaning and to make it cover every disease, whether latent and unknown or not

Society Proceedings

COMING MEETINGS

Montana State Medical Association Miles City July 12 13
Washington State Medical Association Seattle, July 12 14

MISSOURI STATE MEDICAL ASSOCIATION

Fifty Ninth Annual Meeting held at Excelsior Springs May 8 10 1916

The President, Dr C R Woodson, St Joseph, in the Chair

Cardiac Dilatation

Dr. E. P Buddy, St Louis Cardiac dilatation is usually applied clinically to an enlargement of the heart cavities, giving evidence of a failing heart and of ruptured compensation However, of possibly as great if not greater importance are those cases which give no signs of decompensation, and occur usually in healthy individuals There is no demonstrable endocarditis or myocarditis The prominent symptoms are those of cardiac irritability, fatigue or possibly exhaustion The occurrence is often in the young well developed individual especially in athletes soldiers and swimmers Evidence of rupture of compensation is not present, and the cardiac findings clinically are insignificant confusing or absent. The chief and sometimes only complaints are shortness of breath on exertion, precordial pain, fatigue and palpitation Frequently the only complaint is tiredness on the least exertion Vasomotor changes blanching of the face cold hands, paleness around the mouth, giddiness and faintness sometimes occur Symptoms of neurosis —neurasthenia—are often prominent and misleading They invariably have low blood pressure and low pulse pressure

The history of these cases is of primary importance usually being one of various and multiple infections Overwork, worry, strain, overindulgence and emotion are contributing factors Temporary exhaustion of cardiac muscle either in itself or as a manifestation of general exhaustion is probably the real basis Irritable heart often means a fatigued heart which may become exhausted Hyperthyroidism intestinal toxemia, tobacco and beer are factors in producing this irritability The drop heart or the asthenic heart associated with visceroptosis is an example of atonic musculature in which symptoms of transient dilatation appear Functional tests for efficiency are more important than percussion and auscultation of the heart The treatment resolves itself into rest treatment of the underlying condition, infection or toxemia and strengthening the heart muscle increasing its tone by judicious graduated exercises together with means of improving general body well-being

Diagnostic Value of Respiration Tracings

Dr. George Richter, St. Louis Inspiratory and expiratory dyspnea and asthma are caused either by mechanical interferences or by chemical changes in the blood They may be due also to a pathologic condition of the nervous system, as the Biot and the Cheyne-Stokes type of respiration It is an old teaching that in certain cases respirations are unequal in that the two sides will not always move exactly simultaneously The diseased side occasionally appears to lag behind the other while exhibiting a lesser expansion To study and analyze such a phenomenon receivers were applied on both sides of the thorax in a large number of cases to obtain a simultaneous tracing on the same strip of paper It was found that the lagging behind is very rare, where it had been quite apparent on inspection The illusion is due to the psychophysical law of relation between intensity of stimulus and apperception the greater stimulus seems to occur earlier, it is only perceived earlier It is the same with the radial pulses in certain cases of aneurysm Another phenomenon was observed frequently but not so readily recognized by inspection namely that over certain diseased lungs quite frequently in tuberculosis and not in acute inflammatory diseases, an inspiratory retraction of an interspace (not of all interspaces) occurs, frequently limited to a small area of such an intercostal space while over all the other parts a distinct bulging is recorded Thus one obtains opposite waves during the same respiratory phase, also waves of a curious, regular irregularity in shape on the diseased spot This may serve a diagnostic purpose As it is seen occasionally at a very early stage of infection, the cause may lie in an increased tone of the intercostal muscles, a tetanic state analogous to the muscular defense over an appendicitis The respiratory muscular contractions have ceased locally, and the diaphragm now pulls the space inwardly In some cases this respiratory stop is overcome by a more active breathing or it may become exaggerated It is probably due to vagus irritation which on moderate stimulation (also of the laryngeus superior) inhibits inspiration and leads to expiratory standstill (the paralytic thorax in phthisis) while a stronger stimulation causes an inspiratory standstill (asthma) The tetanus means a fixation of both external (inspiratory) and internal (expiratory) intercostal muscles and sets the lung at rest, as in artificial pneumothorax Incidentally the tracings over a normal intercostal space show a very fine, physiologic tremor and a greatly exaggerated tremor over a pathologic area—also of some diagnostic value When the patient coughs we observe many rapid ups and downs in the curve, air being expelled with rapid intermissions—vibrations of the vocal chords

Discussion on Papers of Drs Buddy and Richter

Dr O H Brown, St Louis The muscle rigidity in localized areas mentioned by Dr Richter may be likened to the Pottenger sign and be of practical value by the simple use of the finger tips There are many cases of cardiac incompetency of the types mentioned without marked signs If recognized early much can be done for them

Dr N P Wood, Independence I have obtained good results from venesection in cases of dilatation By taking away a pint or two of blood we reduce very considerably the amount of work required of the heart, which gives us an opportunity to get the benefit of therapeutic measures

"Stomach Troubles" — Their Significance

Dr Francis Reder, St Louis A lesion of any abdominal organ can, by reflex act, cause vomiting In highly sensitive persons, mild peritoneal irritation may cause violent vomiting, in the phlegmatic, severe irritation may cause only mild vomiting The definite nature of the lesion is not always indicated by the character of the vomiting However, the vomiting of food little or not changed, from eight to ten hours after ingestion, usually points to gastric dilatation, persistent vomiting without bile points to pyloric stenosis Cancer of the cardiac extremity gives food little changed, cancer of the pylorus, or duodenal ulceration, food more digested Bloody vomitus suggests ulcer of the stomach or the duodenum or hepatic cirrhosis, profuse, watery vomitus indicates ulcer or cancer of the stomach or pylorus Gallbladder disease occasions vomiting of bile mixed with food A grass-green vomitus is found in general peritonitis Incessant violent vomiting occurs in pancreatic disease, stercoraceous vomit in intestinal trouble of an obstructive nature These cases are usually chronic, and seldom exhibit well marked symptoms other than epigastric pain and vomiting Appendicitis especially chronic, is the foremost causative lesion characterized by a feeling of emptiness not relieved by eating which excites vomiting Gallbladder trouble is often accompanied by irregular paroxysms of vomiting continuous and persistent in the severer type, projectile vomiting usually follows a duodenal perforation Vomiting is an early and constant symptom of acute obstruction, frequent gastric uneasiness with vomiting on slight exertion, of chronic intestinal obstruction Upper bowel obstruction is indicated by profuse continuous vomiting lower bowel lesion by milder attacks Aneurysm of the abdominal aorta and ptosic kidney are other causes The proportion of stomach lesions in cases showing stomach symptoms is believed to be about 1 10

DISCUSSION

Dr. Herman E Pearse, Kansas City It is extremely rare to find an inflammation occurring from irritation along the alimentary tract reflected on the stomach unless the irritation occurs in some organ between the fundus of the stomach and the middle of the transverse colon In some cases of ulceration of the descending colon and obstruction of the rectum, as well as in many ovarian and tubal inflammations, the patient vomits, but in every one of those cases it will be found that peritoneal inflammation has reached over and involved the peritoneal covering of the area mentioned The reason of this is not hard to find It is developmental If the patient vomits from reflected irritation it will usually be found that it is from streptococcic infection on the right side, or along that portion of the intestinal canal If it occurs from a pus infection of the tubes or ovaries, or from the lower bowel, it will be found to have spread to the peritoneal covering of the second portion of the intestine

Atony, a Basic Factor in Most Gastro-Intestinal Pathology

Dr John M Bell, St Joseph Of the two factors which underlie all functions of the alimentary canal—secretion and motion—the latter is most frequently deficient It exists as a result of the enervating life of the day When food leaves the mouth it should be under muscular control until eliminated Gravity plays no part in the onward movement of foodstuffs Atony, the inability of a viscus to pass its contents onward after the chemical function has been performed, is the important factor Food decomposition may take place if delay is a factor Absorption of these products affects the portal circulation so that ulcers or denuded surfaces do not heal but more readily undergo malignant degeneration Absorption from a baggy colon is the most potent factor in cholecystitis, from the duodenum, infection of gallducts and pancreatic ducts The bacteria of a baggy cecum are the most frequent factor in appendicitis Retention in the sigmoid means ultimately a denuding of the mucous membrane, which, with a polluted portal circulation, favors malignancy at this point. Treatment seeks to restore tone to the skeletal as well as abdominal muscles, an antitoxic diet, abdominal massage, life in the open air, exercise a part of the daily life, not merely an occasional effort Medicine merely bridges over conditions until a hygienic life restores to normal

DISCUSSION

Dr Olney A Ambrose, St Louis Two conditions cause apparent retention in the stomach, one is functional atony, the other is organic obstruction The fluoroscope quickly differentiates those conditions They are not so easy to differentiate clinically, but this is one very important point that can be depended on The individual with atony is apparently acutely ill and not chronically ill, while the individual with obstruction producing retention is chronically ill

Public Service Obligations of Physicians How May They Best Be Met?

Dr. W S Allee, Olean The state has given us some incidental protection by laws to govern the practice of medicine and surgery which were, of course, primarily intended to protect the public from impostors and incompetents It is our duty to see that these good laws are not repealed or amended so as to render them useless for the purposes intended Our medical schools have assumed a high rank and compare favorably with the best in our country, we should see that no backward step is taken and that our best schools shall not be hampered by opposition from sources influenced solely by selfish greed We should form a closer alliance with the teachers of our state by helping to get their services proper recognition and better paid We should take a more active interest in politics than we have done in the past I should be glad to see every doctor become an active politician, using the word in its better sense We should cultivate a closer relation with the public press, hoping to have fair treatment in the discussion of questions pertaining to medicine We might influence the press favorably through information supplied by publicity committees from the several county societies We should help to get good officials in city, town and village governments At the primaries we can do our best work, get good men to accept the tender of a nomination and then use our utmost power to nominate and elect them Our cause being just, we have but to place it before the public in a proper light and success is assured

DISCUSSION

Dr Herman E Pearse, Kansas City In the last fifteen years, since the beginning of the fight of the medical profession in Missouri for better things commenced, no one has taken a more successful part than Senator W S Allee, he has stood like a stone wall for the things that are right The next strong force that has helped us so greatly in acquiring what we want has been the services of The Journal of the American Medical Association When it began the campaign of publicity, the campaign against wrong, the campaign for public health, the campaign against nostrums and quackery, the Association was assailed from every quarter The American Medical Association has been sued, threatened, and injured in every way possible, but never for a moment has it turned from the support given us Whenever we tried to do what was better for the medical profession in our own communities, whenever we tried to support professional ethics and render public service, we have always found The Journal standing by us, ready to advise and to help

Dr C H Brown, Fair Play I want to indorse particularly one part of Dr Allee's paper, in which he referred to the establishment of a better understanding with the press There should be a better cooperation of the medical profession with the press for the simple reason that through it we can reach the people and educate them in a way that we are not now

Transplantation of Bone

Dr Ernest F Robinson, Kansas City My experience in supplying bone defects consists in resection of the ulna, radius and inferior maxilla, and in the transplantation of bone in the treatment of ununited fractures In most of these cases I have used the so-called medullary splint or "dowel peg," usually taken from the tibial crest The periosteum has been left adherent to the transplant Albee's "bone-inlay" I have found admirable for certain cases, and especially adaptable in the immobilization of the spine in tuberculosis of the vertebra Reconstructive surgery is the highest aim of surgical art Transplantation of bone is one of the great steps of this modern surgical progress, with infinite possibilities for good

DISCUSSION

Dr W S Sutton, Kansas City Bone transplantation properly done is the nearest to a "sure thing" that surgery presents The fact that bone grafts live is no better presented in any case than in badly comminuted fractures The treatment of these fractures bears out fully the contention of Macewen that the implantation of small fragments of bone will in itself produce a large growth of bone Why, then, do we use the large bone transplant? It is because we want something which will help to hold the bones in place That means a long transplant

Dr J J Link, St Louis Bone grafting is a simple operation when done by a skilled operator and if done under favorable circumstances, under absolute asepsis

Dr Gordon Beedle, Kansas City Operative work on bone fractures has been an evolution The first object has been to get away from the metallic appliance, the second, to simplify the surgical procedure, third, to limit surgical procedure to the operative field if possible, and last of all, of course to get ideal results Splinting of bone will give ideal results in some cases, even the Lane splint, inlay splint, or the medullary splint Albee takes the graft from the proximal fragment and, bringing it down in slat form, bridges over the fracture This is superior to the medullary transplant in that the field of operation is confined to one bone

Dr C B Francisco, Kansas City You can get a better fit with the inlay splint, and in order to get 100 per cent cures you have to have a good fit That is illustrated best, perhaps, in cases of congenital fracture of the tibia

Dr. Charles Geiger, St Joseph It is only a matter of time until the nail or the wire or the plate will become infected and will have to be removed A bone peg is not a foreign body The bone will become absorbed or will unite with the surrounding bone and never cause trouble

Dr. Robert M Funkhouser, St Louis There is a place for the Lane plates I have used them in cases in which nothing else would answer the purpose Especially is that true in cases of fractures in connection with joints

Sporadic Meningitis in Children

Dr. Phelps G Hurford, St Louis In five years I have seen forty-seven cases of meningitis in which the infecting organism was found Twelve of these were cases of the epidemic form and are not considered as sporadic cases Of the remaining thirty-five cases, twenty-two were due to the tubercle bacillus, seven to the meningococcus of Weichselbaum and two each to the streptococcus, staphylococcus and pneumococcus An interesting feature of the cases due to other cause than the tubercle bacillus is that they occurred in children under 2 years of age in all but four instances, and the tuberculous cases were in infants under 2 years of age in only ten instances One case due to the staphylococcus was in an infant 12 days old The only symptoms were frequent convulsions and irregular, low fever There was no rigidity, no Kernig sign, no constancy about any of the reflexes The baby developed a rapidly progressing hydrocephalus and died in about two weeks No focus of infection could be demonstrated Lumbar puncture done on the second day of observation showed a purulent fluid with pure staphylococcus culture Of the nine infants with purulent meningitis, five showed definite hydrocephalus, two of them after the meningeal symptoms had entirely subsided All the infants died The four older children recovered There were three cases of chronic posterior basal meningitis that were assumed to be due to the meningococcus, all terminated fatally, but as the organism was not found and no necropsy was obtained, they are not included The most valuable lesson learned was the advisability of treating every case of purulent meningitis with Flexner's serum at once, unless the first examination shows another organism than the meningococcus The serum should be given frequently, until fever and rigidity have disappeared. Spinal puncture is the only positive means of diagnosis It should be performed in every case with meningeal symptoms and the fluid examined chemically, microscopically and by culture Meningeal symptoms may be present in almost any acute infectious disease The intoxication of infants is likely to resemble meningitis

Ankylostoma Duodenale

Dr. A H Thornburgh, West Plains A man, aged 52 a well driller who had worked during the past four or five years in an infected district in the South, had been in failing health for two years past. He had alternating attacks of diarrhea and constipation I demonstrated the ova of hookworm in the intestine, and the state bacteriologist confirmed my findings I gave him the thymol treatment which was followed by a severe exacerbation of the bowel condition with mental derangement severe diarrhea, and progressive and rapid weakness, which terminated in death in about four weeks

Systemic Blastomycosis and Coccidioidal Granuloma

Dr Samuel T Lipsitz, St Louis My case was that of a negro man who lived about fifty-one days after the onset of his disease, the shortest course recorded He developed signs of bronchopneumonia and numerous subcutaneous and intramuscular nodules appeared over various parts of his body These suppurated and showed double-contoured, endosporulating organisms These were also found in sections taken from the surrounding tissue and in the sputum Characteristic cultures were grown The disease was reproduced in a guinea-pig, the same bodies were again found and the organism again grown in pure culture This is the first and only case of coccidioidal granuloma reported in Missouri

Vaccination in Smallpox

Dr. F M Vessells, Perryville There is a growing sentiment among country physicians that our modern so called smallpox is not smallpox but another and very much milder disease, that it is not necessary to vaccinate, that vaccination is more severe in its manifestations than the disease. Some physicians tell their patients not to be vaccinated This is wrong, as can be shown by clinical reports and statistics

Need of a Real County Health Officer for Rural Districts

Dr J Q Cope Lexington The sanitation of the rural districts is bad It has never had any supervision and little advice from medical authority Contagious diseases are seldom quarantined properly Rural schools, mining camps, unincorporated villages and suburbs of cities are often in a deplorably insanitary condition, and there is no one in authority to correct this state of affairs or give relief The water supply, the disposal of dead animals, precautions against the fly and mosquitoes, the proper construction of closets and dangers of the ordinary kind are subjects for intelligent regulation, and a general system of education should be carried on in regard to all such matters Under the present laws of Missouri the so-called county health officer has no authority in this broad and important field About the only thing he can do is to quarantine contagious diseases and that is seldom done because there is no law requiring that such diseases be reported The county health board is composed of a physician and the three county judges The judges are generally farmers and have not studied sanitation or preventive medicine, and therefore do not realize the importance of this work They think what was good enough for their fathers is good enough for the people now Consequently they oppose the health officer in everything that is not absolutely necessary, and refuse to pay the bills for anything that the physician may do on his own initiative A new law is needed prescribing the general duties of the county health officer, placing him on a fixed salary, and requiring him to give his entire time to the work, thus making him independent of the county court or any one else

The law should require that all contagious diseases should be reported to him that they be quarantined, and that all cases of tuberculosis be regulated It should give the county officer authority to abate all conditions that are dangerous to the public health He should be an advisory officer in all things pertaining to public sanitation and the prevention of disease and it should be part of his duty to institute an educational campaign along these lines Very few small villages have any board of health or health ordinances through which contagious diseases or other dangerous conditions can be controlled Advice from the county health officer in such times would be a great benefit Advice coming from an officer especially fitted for such work and with the authority of his office behind him would do much more good than if the advice was given by an ordinary physician Such an officer would be a great help in driving out quackery and ignorant and dangerous opinions held by the common people It would be a long stride in freeing the people from ignorance and superstition, without which quackery could not exist.

Rural Sanitation

Dr. J C Boone, Charleston The difficulty of getting practical sanitary measures operative in rural districts is the lack of understanding of the many articles published on the subject, customs and habits of thought, indifference due to interest in other matters, and because a great many do not get the literature to read The personal lectures from time to time given by the family physician are but half carried out, though effective in creating a desire for something to be done Present laws are defective Sanitary work is haphazard Three methods to overcome this may be suggested

1 The department of preventive medicine of the state university to send out lecturers to cooperate with the agricultural board at county fairs, agricultural meetings and by special arrangements when possible where exhibits are made and inspection of premises with instructions given This would create a desire for more thorough work.

2 One or more counties to organize into sanitary districts with full time health officers paid by the districts All sanitary affairs of county and towns and villages to be under the care of such officers This would help but it is slow and expensive to the organizer Unless adjoining counties also organize, its effectiveness is hampered

3 The state to be organized into full time health officer districts and the cost to be paid for out of the state funds

This would systematize the work, conserve energy and be more economical Cooperation with an international health commission would be advisable District laboratories could be established to give quicker replies to the country doctor's specimens for aid in diagnosis These laboratories to work under the state laboratory or the state university

---

MEDICAL SOCIETY OF THE STATE OF NEW YORK

One Hundred and Tenth Annual Meeting, held at Saratoga Springs, May 16 18, 1916

(Concluded from page 2037)

Technic of Abdominal Cesarean Section

Dr William M Brown, Rochester Patients who suffer from most shock, distention and pain are the ones who have had most traumatism and handling in the peritoneal cavity To avoid the slipping down of the uterus in the pelvis before the incisions are closed, I devised a method of temporary suturing of the uterus to the abdominal wall which prevents emptying of the uterine contents, and protects the viscera from handling Bleeding is more easily controlled than in pelvic delivery Later a procedure was introduced which simplified the method still more This was the use of from four to six of the ordinary power clamps of Moynihan or Backhaus The uterus was clamped firmly to the abdominal wall, instead of sutures being used Among fifteen cases treated in this way, there have been no deaths, and recovery has been remarkably smooth and free from vomiting and distention

DISCUSSION

Dr J Wesley Bovée, Washington, D C I should like to know the method of treatment of the abdominal wound and the uterine wound in operating in cases of suspected infection

Dr Sylvester J McNamara, Brooklyn By what method does Dr Brown apply the forceps? How much abdominal wall is included in the grasp of the forceps? Has Dr Brown any experience with tearing of the uterine wall by such forceps?

Dr A B Miller, Syracuse Does Dr Brown select the cases in which he suspects infection, or does he apply this method in his general cases? Generally, I feel that the uterine contents will not give rise to infection in the peritoneal cavity, although they may give rise to endometrial trouble The method of Davis, of upper abdominal operation, prevents adhesions from taking place One may do cesarean section many times and not have any infection I feel that nothing is gained by fastening the uterus to the abdominal wall

Dr William Bryan, West New Brighton I have had better results since I have been doing the Davis operation with high incision, and I have paid very little attention to the contents of the uterus and whether they escaped or not I have had no occasion to regret it I have not clamped the abdominal wall to the uterine wall I have attempted to suture the uterine wall to get a mechanical grip, but it takes extra time and traumatism If one succeeds, one has not accomplished much The uterine contents do not do much harm Careful technic, rapid operation and a simple procedure, with less delay and less traumatism, give the best results

Dr William M Brown, Rochester About the treatment of the incision and suspected infection, I have practically made no difference, that is, unless I am certain that there is no infection I have had one case of infected uterus in a hysterectomy I did not know the patient had a rise of temperature I was impressed with the fact that while the woman had a severe sepsis, chills lasting twenty-five minutes and a temperature of 106 F, there was no infection of the peritoneum whatever It was a pure septicemia She recovered perfectly In regard to tearing of the uterine wall, I have had nothing of that kind We used Guy sutures, and they tore out because they did not go into the abdominal wall deeply enough The clamps do not go into the endometrium at all The abdominal incision is made and then the uterine, and the assistant picks up a comfortable portion of the uterine muscle and the whole abdominal wall half an inch from the edge of the incision and clamps it I then finish my cut through the uterus The main question is not so much one of infection as it is of handling the intestine, after the uterus is emptied it contracts, and the intestines will override unless you take a towel to pad them off I then close the uterine incision

The Influence of Syphilitic Invasion in Gynecology and Obstetrics

Dr J Wesley Bovée, Washington, D C Syphilis is about eight times as frequent as admissions state There is an alarming prevalence of syphilis among those who deny having it, or who present no symptoms of it Morrow and Neisser state that 5 per cent of the German population and 2 per cent of the population of the United States have been infected In 619 cases collected by me from gynecologic and obstetric clinics, there was a probable total of 38 per cent infections, about 60 per cent of these were white women Syphilitic infection in females is much more obscure and easily overlooked or mistaken for other conditions than in the male Cervical chancre closely resembles erosions and infiltrations Local manifestations of syphilitic invasion of the female genital tracts are slight, disappear without leaving a trace, and hence commonly escape detection Tertiary lesions of the cervix, however, are sometimes seen Possibly spermatozoa carry spirochetes into the ovaries and tubes, but thus far this is unproved Considering the relationship of syphilis, as regards obstetrics, we can discuss the probable routes of infection from mother to child I feel that there is no such thing as a healthy mother with a syphilitic child, and vice versa Infection is latent in one or the other Once a diagnosis of syphilis is established, treatment should be as vigorous as is compatible with safety It would seem beneficial, perhaps, to regard all patients as at least mildly syphilitic and to apply antisyphilitic treatment

DISCUSSION

Dr Thomas J Watkins, Chicago I believe that the frequency of lesions on the cervix is greater than stated This emphasizes the risk of examining patients without gloves, and also the importance of sterilization of instruments between the examination of one patient and another It is not too much to say that all obstetric and gynecologic cases should have the Wassermann test A man who had made examinations of 4,000 cases found that of those who had a positive Wassermann, 50 per cent were women in whom syphilis was not suspected

Dr George Gray Ward, New York The matter is of interest in regard to the question of Colles' law Recently Dr J Whitridge Williams reported a case which seemed to prove that this law might hold good He had a case in his service of a negro woman who had had eleven labors under his control She had had repeated Wassermanns, but all were negative The first five labors were perfectly normal, the sixth was a twin birth, and one child was markedly syphilitic, the other was not This was probably a case of superfecundation Subsequent labors under observation gave no evidence of syphilis The woman never showed syphilis If the woman had two lovers at the time of conception, it would be the strongest evidence that there was reason to believe in the validity of Colles' law

Vaginal Subtotal Hysterectomy for Procidentia and Cystorectocele Associated with Fibroid Growths or Fibrosis Uteri

Dr Hiram N Vineberg, New York This method possesses advantages over total hysterectomy because it supports the bladder and it is attended by less hemorrhage The technic is as follows Longitudinal incision of the anterior vaginal wall, extending from near the urethral meatus within an inch or an inch and a half of the cervical os Separation by sharp or blunt dissection of the vaginal walls from the underlying bladder Pushing of the bladder up from the uterus and base of the broad ligament by gauze dissection Transverse incision of the vesico-uterine peritoneal fold Delivery of the body of the uterus through the vaginal incision If the ovaries are to be preserved a ligature is passed around the ovarian ligaments and the tissues cut between the ligature and the uterus If they are to be removed, the ligature is passed around the infundibulopelvic ligament A ligature is passed at the level of the os internum, the body of the uterus is amputated at the desired level by a wedge-shaped incision the thin edges of the wedge toward the cervix the edges of the wound then brought down by continuous catgut suture and the raw area of the cervix sutured laterally in the same way The cervical stump is then sutured to the subpubic fascia and anterior vaginal wall Further modifications of this operation would be the shortening of the uterosacral ligaments to prevent the cervical stump from pushing downward Of thirty-two cases treated in this manner twenty-five have given excellent results One was a failure

Technic of Vaginal Plastic Operations for Cystorectocele and Prolapse of the Uterus

Dr R T Frank, New York The operation for cystocele is as follows The anterior lip of the cervix is seized with volsella and pulled to the vulva the mucosa is seized with artery forceps half an inch below the mucosa, the mucosa is incised between the two fixed points and resected on both sides half an inch along the line of incisions superficially, neither deep nor wide reflection is permissible, narrow flaps on each side are seized with two forceps by an assistant at the lowest angle of the wound the bladder is freed from the cervix in the median line by the snips of scissors, the bladder is freed by pushing firmly up against the cervix until the lateral fibers become plainly demarcated After exposure of these bladder pillars the vaginal flaps are to be separated more widely, a thin line of fascia continuous with the pillars is to be preserved. The repair is to be done as follows Two transverse sutures of medium chromic catgut are passed taking in first one pillar then the cervix then the opposite pillar, the upper suture is passed at the lower border of the peritoneal reflection the next half an inch below it, the pillars are united firmly in the median line by tying thus raising the bladder to a higher level and making it flat instead of bulging

For rectocele the repair is as follows After exposure, the rectum should be pushed away from lateral structures with the finger The approximation should take place at the descending rami of the pubis The rectum should be held aside and the mass of tissue grasped and a heavy chromic catgut suture should be passed taking in the lateral fascia and underlying muscle on one side then forming a partial purse string suture grasping the rectal fascia between the rectum and mucosa around the upper part of the rectocele, and again grasping the lateral structures on the opposite side the suture being tied The rectum is thus firmly held fixed and back. The gap in the mucosa should then be sutured with interrupted sutures, as this region later becomes less accessible

Usefulness and Definite Limitations of the Pessary Treatment of Retroversion and Prolapse

Dr. Robert L Dickinson Brooklyn In the group that can be taken care of by pessaries there should be included first, the retroversions of early pregnancy, second, postpartum retroversions, third, bad risks, and fourth a few cases in which retroversion has affected the bladder In regard to the first group of cases the physician should examine the patient early, between the first and second omitted period, and give written directions as to treatment, as in this way serious retroversion can be prevented. In the postpartum group examinations should be made at two weeks, six weeks and three months postpartum If patients are well taken care of then operation later can be avoided Third, the bad risks, the women with diabetes *tuberculosis* or with sclerosed arteries in whom resistance is poor are poor subjects for operation. These naturally fall into the pessary class and the pessary relieves constipation and improves general health To the operative class belongs the cystocele and rectocele group I am more inclined than formerly to operate on elderly women Working women, as a rule should be operated on They have no time to keep coming to the physician to be examined In the case of young girls it is better to do an operation rather than give them the office habit There is distinct use for a pessary for a few months after operation until the organs have had time to recover tone The kind of pessary which the patient wears with comfort and can handle herself with is the one most likely to suit that particular case The patient should be instructed how to remove and cleanse it, that scrupulous cleanliness is important, and that she needs regular douching If this is attended to, ulceration need never occur The pessary can be taken out at night and put in again in the morning

DISCUSSION ON THE PAPERS OF DRS VINEBERG, FRANK AND DICKINSON

Dr J Riddle Goffe, New York The pessary has a definite place in the treatment of these conditions, but speaking broadly it is only a temporary device, to be discarded and supplanted by operative procedure when the time and place serve Age is rarely a contraindication for surgical procedure in a woman who is able to be on her feet Dr Vineberg's operation seems to come into direct competition with supravaginal hysterectomy There is no question about the superiority of the latter In the completion of the operation the normal relation of parts is restored and the physiologic function of the ligaments and the bladder maintained

Dr Thomas J Watkins, Chicago The pessary has a very important field, even if a limited one Its use can only be decided by one who has done much work on the mechanics of the pelvis As regards prolapse operations, conditions get worse especially after the menopause, so that rectocele and cystocele conditions must usually be corrected before they become extensive, hence operative procedures in this class of cases give better results There is no one operation that is best for prolapse of the uterus or of the bladder Operative procedure should be modified to suit the case I myself favor a modified transposition operation rather than hysterectomy

Dr H S Crossen, St Louis The ball pessaries, the Smith pessary and other forms slip out I have used the double horseshoe pessary to good advantage No one can learn to use these pessaries by descriptions but simply by personal practice The horseshoe pessary can be left in place for a long time if the patient comes for observation at regular intervals

Dr J Wesley Bovée, Washington, D C The farther we get away from any one particular operation, or from any one form of treatment the safer we are Those who are addicted to one form of operation will find they will have to use pessaries later as reputation savers The best time to use a pessary is before operation A large proportion of patients can then be helped If the pessary is the right one it will not cause inconvenience If it causes pain it is not *the right one* The soft pessary is to be condemned, the hard rubber pessary is the best in use at present The Hodge modification of the Smith pessary is the best type

Dr Richard R. Smith Grand Rapids Mich I endorse most heartily what Dr Dickinson said In young girls and young married women before childbearing, there is nearly always a neurotic element, and the less attention is called to the pelvis the better In older women operation alone should be used in certain complicated cases But it would be well to bear in mind one thing In women during the childbearing age there should be no operation done which would interfere with this important function *After this period is* over other operations can be considered I have had the best results from Dr Watkins operation.

Dr Leroy Broun, New York I cannot recommend Dr *Vineberg's operation in complete* procidentia The operation that will give the best results is complete hysterectomy, sewing together the broad ligaments and putting the bladder on top of them

Dr. Samuel W Bandler, New York On the first sign of retroversion, the Smith-Hodge pessary should be introduced When involution takes place, there is no longer retroversion but retroflexion If the patient complains of pelvic pain, and retroversion is found, the patient can be directed to wear a pessary provided there are no complications, such as shortened ligaments If the same patient comes back later and says that all her symptoms have disappeared, she may be given the choice of wearing a pessary for the next twenty-five years or of having an operation and dispensing with the use of the pessary

Gynecologic Surgery in Hysteroneurasthenic Patients

Dr H S Crossen, St Louis When the pelvic condition is seriously depressing the general health through blood loss, or pain due to lesions, the lesion must be removed, irrespective of the coexisting nervous disease In markedly neurasthenic patients, where pain is of secondary importance, operation is contraindicated, but if prolonged treatment with all ordinary measures fails to relieve pain, then operation is indicated When operation is necessary sooner or later, it had better be done before neurologic treatment Rest in the hospital may give a good start to the recovery of the patient, but if the influence of the lesion is questionable, the neurologic treatment should come first, as with treatment, operation may be rendered unnecessary

DISCUSSION

Dr Leroy Broun, New York What treatment should be given to these neurotics? If there are no local findings, the cases are undoubtedly for the nerve specialist, but if there are distinct local findings from the point of view of the gynecologist, he must attend to them, but patients must also be treated neurologically Whatever affects the general health of these patients affects their nervous and mental status, and the gynecologic surgeon must remove whatever lesion may have a bearing on this In my own experience, in operating on 500 insane patients, thirty-two were so much improved in general health that they were discharged from the hospital as temporarily cured

Dr Gordon Gibson, Brooklyn The question to be asked is, "Is the patient neurasthenic?" Is it a mild pelvic lesion influencing an exhausted nervous system, or are the symptoms entirely due to the pathologic condition? The history of the neuropathic or psychopathic patient often discloses a slight pelvic lesion

Dr Samuel W Bandler, New York I believe there are no cases of pelvic disease unless associated with some form of ductless gland disturbance Pain is often reflex in these cases The condition of the patient is affected through the medium of the ductless glands, of which the ovaries and the thyroid are the most important The nervousness is produced by the metabolic change For that reason, the nervous patient is often better for an operation if one does not promise too much

Dr Richard R Smith, Grand Rapids, Mich The first important point is the necesity of a thorough study of the physiology of the pelvis, and the second is the relation of the pelvic reflexes to the neuroses The gynecologist should act in consultation with the neurologist rather than the reverse

Practical Aspects of the Internal Ovarian Secretion

Dr William P Graves, Boston In genital atrophy there may occur abnormalities of great importance to the gynecologist Circulatory disturbance of the external genitals, such as kraurosis and furunculosis of the vulva, may be greatly relieved or cured by the administration of ovarian extract Ablation symptoms, in the great majority of cases, are markedly relieved by administration of ovarian extract After hysterectomy, vasomotor symptoms follow the transplantation of ovarian tissue and also of leaving the whole ovary in situ, similar in degree and frequency to those following total ablation of the ovaries Functional amenorrhea in the young is often relieved by the administration of ovarian extract Extracts of the whole ovary are more efficacious than extracts of the corpus luteum

DISCUSSION

Dr. Samuel W Bandler, New York I agree with Dr Graves that the extract of the whole ovarian tissue is more efficacious than that of corpus luteum alone I do not use corpus luteum extract. In reference to operations done in the later years of a woman's life, such as hysterectomy for fibrosis uteri, I do a vaginal hysterectomy, and if the ovaries look normal, I leave them behind I do not think it is wise to leave an inflamed ovary, for that would invariably necessitate a second operation If, after the operation, the patient is put on ovarian extract, it will prevent the occurrence of flushes If my surgical judgment so dictates, I am never afraid to remove both ovaries, and the treatment with ovarian extract is begun at once

Dr R T Frank, New York I must protest against this statement of Dr Graves that in ordinary hysterectomy it is unimportant whether the ovaries are removed In my experience, if the ovaries are left behind, there is much less likelihood of these troubles occurring Unless an ovary and tube in a healthy condition are left it will do no good to leave them, and if the woman is close to the menopause, it is certainly important to leave an ovary with good circulation

Resection of the Pars Interstitialis in Diseases of the Fallopian Tubes, with the View of Preserving the Uterus

Dr L K P Farrar, New York Many uteri recover after resection of the tubes The operation consists of the following steps Preliminary curetting and disinfection of the uterine cavity Laparotomy incision, inspection of ovaries, oophorectomy only to be done where imperative Ligation of the ascending branch of the uterine artery Excision of tube down to the uterine mucosa Closure of the wound with interrupted sutures

Pelvic Infection

Dr John O Polak, Brooklyn A study of results of conservation of ovaries with resection or suspension has caused us to swing toward more radical treatment, because it has been found that it is useless to conserve ovulation without menstruation, and that a conserved ovary behaves badly in cases of pelvic infection It tends toward cystic formation and pain, and the trauma and circulatory disturbance disturb the functional activity Another important point is that no operation should be undertaken during the acute stage of infection, or when exudate is present Bacteriology of the infection is important as different organisms have different histories Gonococcus and streptococcus infections differ widely, the former causing suppurative salpingitis, oophoritis and peritonitis, the latter lodge almost always in the parametrium

Infection of the Uterine Appendages

Dr E E Montgomery, Philadelphia Infection of the appendages is favored by any condition that favors congestion of the pelvic structures These conditions lower resistance of the tissues and promote nurture of the infecting elements The infection spreads by the mucous surface, and is accentuated by the disturbing influence of menstruation The most usual organisms are the gonococcus, staphylococcus, streptococcus, colon bacillus, tubercle bacillus, pneumococcus and influenza bacillus The gonococcus is most superficial in its effect, but prepares the ground for other organisms and is thus more baleful in its work Nature endeavors to protect herself by closing up the tubal ends against the invader Sometimes the infection is so virulent as to prevent this, sometimes so slight that it does not take place The peritoneum is sometimes directly infected through the wall, causing an extensive abscess involving the tube and ovary Such effects necessitate the sacrifice of the organs

DISCUSSION

Dr F F Simpson, Pittsburgh I would emphasize the extreme wisdom of avoiding operation until all inflammatory exudate has been absorbed completely, as its presence is Nature's positive statement that there are virulent organisms present which she fears to admit into the circulation, and if Nature fears to admit these, the surgeon should be afraid to spread them on the peritoneal surface

Dr. Thomas J Watkins, Chicago I believe that for years we have been making mistakes and calling more of these cases gonorrheal infection than was necessary Varieties of streptococcus infection that have been present in throats and mouths have given increase of infections in the peritoneum I have had two cases of salpingitis secondary to throat infection The knowledge that has been gained in the treatment of tuberculosis should be utilized in the treatment of acute pelvic infection Outdoor treatment is as important for the one as for the other

Dr. Hiram N Vineberg, New York When the uterus and tubes have to be removed, the question is whether or not to leave a portion of the ovary My experience agrees with that of Dr Polak that the patient is very much worse off if we leave a portion of the ovary It is liable to undergo cystic degeneration If, when doing an operation for fibroid uterus, I can leave enough uterine tissue behind and enough ovary so that the woman can go on menstruating, it will do good but if the uterus has to be removed entirely, it is a question whether what we can retain of the ovary will prevent menopause symptoms

Dr H S Crossen, St Louis Preservation of the ovary is well worth the chance of a second operation from the psychic standpoint

Renal Tuberculosis

Dr. Henry Dawson Furniss New York Of thirty-three personally observed cases in 20 per cent there was a history of other tuberculous lesions and of these 15 per cent were associated with pulmonary tuberculosis In 50 per cent of the cases, cystitis was the first symptom, in 15 per cent, microscopic hematuria, which was followed by cystitis The hematuria is vesical rather than renal in origin Renal or ureteral colic pain was seen in 15 per cent of the cases The cystitis was found to be the most distressing symptom, and engendered loss of sleep from frequent urination Nephrectomy was advised for this, before extensive bladder involvement had taken place Pyuria was present in every case Tubercle bacilli were found in slides in 85 per cent of the cases In all except early cases there was bladder involvement, characteristic of tuberculosis By the time the patients applied for treatment the lesions were advanced enough to show characteristic changes These were redness and induration of the ureteral orifice, often with nodular irregularities With progress of the disease the induration increased the meatus became more involved, the trigonum retracted, and the ureter shortened Later ulceration occurred and finally the whole bladder became lined with granulation tissue In cases of long duration the ureter was involved and in catheterized urine the finding of tubercle bacilli was evidence of tuberculosis of at least one kidney The general health of these patients was usually good In most cases nephrectomy was done, with ligation and division of the ureter The percentage of postoperative fistulas was about the same whether drainage was used or not. Perhaps undrained cases gave better results It seemed better to excise the ureter through an extra incision, extraperitoneally Only one death occurred as a result of operation but this was in a case complicated with pulmonary tuberculosis About 30 per cent of postoperative fistulas have been reported but this did not seem detrimental to the health of the patients even though it lasted for as long as two years After the operation there seemed to be a typical tuberculin reaction, the exacerbation of other tuberculous processes and rise of temperature, this being apparently due to liberation of tuberculous material into the body About half of the patients seen were between 20 and 30 years of age.

DISCUSSION

Dr. Alfred M Wose, Syracuse It is important to get these cases early, because if one delays in sending these patients for cystoscopy, the bladder will contract and in many cases it is impossible to make a differential diagnosis of the urinary secretion, in fact, one cannot find the ureters One has then to base his observations on the bladder content and the clinical symptoms

Dr Hiram N Vineberg, New York My experience has been that the earlier I saw the patient, the better was the result The more the bladder is involved the less benefit the patient will have from the operation In any case of cystitis lasting for some time one should suspect tuberculosis

Current Medical Literature

9 *Nonteratomatous *Bone Formation in Human Ovary* G W Outerbridge Philadelphia
10 Gangrene of Lung Following Artificial Pneumothorax E N Packard Jr Saranac Lake N Y

3 **Saphenoperitoneal Anastomosis for Ascites**—Bernheim cites the case of a man, aged 68 years, who had suffered from ascites for over a year, the cause being an obstruction of the portal vein consequent on a cirrhosis of the liver A Talma operation had been done some months previously without relief Repeated tappings were the order of the day, at each tap several gallons of fluid being removed Under local anesthesia, Bernheim exposed the left saphenous vein for a distance of about 6 inches and cut it off at the lower end of the wound tying off both ends The peritoneal sac was exposed through a 2 inch incision just over the external ring, at which point a very small hole (about 12 cm) was made and the greater part of the ascitic fluid that was present—2 gallons—was drained off This done, the tissues overlying Poupart's ligament were undermined by means of a curved clamp, and the proximal end of the severed vein pulled up into the small incision, where a lateral anastomosis was done between the blood vessel and the peritoneum, ordinary blood vessel silk being utilized. The patient died two days later No cause whatever could be found to account for his death

4 **Possibilities of Antitetanus Serum.**—Robertson proposes that every case in which symptoms of tetanus appear be treated at once, without delay, with an intravenous injection of 3 000 units of antitetanus serum By this method every patient who exhibits the symptoms of tetanus is given the best possible opportunity of preserving his life. Difficult or dangerous surgical operations, such as the intracerebral method or intralumbar injection, need not be considered, the loss of time and local pain of subcutaneous injections are avoided and, what is of less theoretical but nevertheless often of more practical serious moment the use of large amounts of serum is obviated The method consists simply in the immediate insertion of 3 000 units of antitoxic serum into one of the veins of the elbow Furthermore it is of little or no value to repeat this dose twice a day or every other day or, in the large majority of cases at all The one injection of 3 000 units is amply sufficient to neutralize the toxin which might be elaborated and absorbed from any ordinary tetanus infection, and this antitoxin will remain effective in the blood stream for at least one week, namely, long enough to decide the issue in almost all cases of human tetanus If the case should become chronic or suffer a recurrence or any other special condition should develop which might indicate

the advisability of giving more antitoxin, there can be no objection to a second or even a third dose, but here again it should be emphasized that a small dose is fully as effective as a large one and a large dose is as unjustifiable the second time as it was the first

9 **Bone Formation in Human Ovary**—As a result of the study of fourteen cases from the literature and seven personal observations as recorded by Outerbridge it appears that true ossification of the ovary may occur independently of any neoplastic or teratomatous process Such bone formation is probably metaplastic in character, it occurs chiefly in corpora fibrosa or fibrous portions of the stroma, and particularly in ovaries from cases of pelvic inflammation In one instance of the personal series it involved the wall of a serous cystadenoma, and in one a spontaneously amputated ovary which was found adherent to the omentum at the bottom of Douglas' pouch, associated with complete atrophy of the corresponding tube

16 *Bacteriologic and Experimental Studies on Gastric Ulcer H L Celler and W Thalhimer, New York.

11 **Development of Malaria Parasites**—The experiments reported by King were undertaken for the purpose of determining the susceptibility of any species of anopheles to infection with malaria parasites As a result of these experiments *Anopheles punctipennis* is shown to be an efficient host of the organisms of tertian and estivo-autumnal malaria, *Anopheles crucians* of estivo-autumnal malaria, at least, and information has been obtained on the relative susceptibility of these two species and *Anopheles quadrimaculatus* The latter species has been considered to be the principal species concerned in the transmission of malaria in the United States With *Anopheles punctipennis,* developmental forms of the exogenous or sporogenic cycle of *Plasmodium vivax* were demonstrated in six (85 per cent) of the seven mosquitoes dissected, and the development of *Plasmodium falciparum,* in four (20 per cent.) of twenty specimens These four infections, however, occurred in a series of thirteen specimens fed on one person, so that the percentage was actually 33 With *Anopheles crucians,* oocysts or sporozoites or both oocysts and sporozoites of *Plasmodium falciparum* were found in nine (75 per cent) of the twelve specimens dissected. No tests were made with this species and *Plasmodium vivax* *Anopheles quadrimaculatus* was employed as a control species in the experiments and became infected in the following ratio eight (66 per cent.) of twelve specimens with *Plasmodium vivax,* and three (15 per cent) of nineteen specimens with *Plasmodium falciparum*

12 **Intestinal Obstruction**—This communication deals with analyses of the blood in intestinal obstruction, intestinal closed loops, and other acute intoxications The authors found that most cases of intestinal obstruction, especially with signs of acute intoxication, showed a high noncoagulable blood nitrogen If the reading is high, one may assume a dangerous grade of intoxication, but, on the contrary, one may not assume that a low reading gives evidence of slight intoxication, because a fatal outcome may be associated with a low reading Acute proteose intoxication due to injection of a pure proteose will show a prompt rise in blood noncoagulable nitrogen, even an increase of 100 per cent within three or four hours These intoxications also show a high blood content of creatinin and urea The residual or undetermined nitrogen may be very high A human case of intestinal obstruction with necropsy presented blood findings exactly similar to those observed in many animal experiments The kidneys in practically all these experiments are normal in all respects The authors suggest that it is possible that protein or tissue destruction rather than impaired eliminative function is responsible for the rise in noncoagulable nitrogen of the blood in these acute intoxications Transfusions of dextrose solutions often benefit intestinal obstruction, and may depress the level of the noncoagulable nitrogen in the blood Some cases show no change in noncoagulable nitrogen following transfusions and diuresis, and, as a rule, such cases present the most severe intoxication

14 **Epinephrin Absorption After Intratracheal Injection**—It is shown by Auer and Gates that a simple intratracheal injection of a solution in a normally breathing rabbit penetrates within a few seconds to the alveoli, chiefly those of the left lower lobe, that absorption is rapid and well maintained, and that the procedure may be repeated effectively a number of times even with a substance like epinephrin, which decreases absorption It was also shown that absorption of epinephrin from the lung could be obtained at a time when double the dose given intramuscularly exerted no blood pressure effect whatever, and that absorption could still take place after the development of pulmonary edema, when there was no undoubted dilution of the injected solution with a serum containing liquid and when a diminution of the absorptive field had occurred Absorption of liquids injected into the lung probably takes place largely through the capillaries of the pulmonary veins, to a slight extent possibly through the capillaries of the bronchial veins which empty partly into the pulmonary veins, partly into the azygos veins, and probably some absorption occurs also through the lymphatics By far the larger proportion of the absorbed material will thus be rapidly delivered to the left auricle and then to the left ventricle At each succeeding systole, as long as absorption continues, a fraction of the drug will be driven into the coronary arteries and be able to affect the musculature of the heart pump This fact ought to render the procedure of intratracheal injection a valuable method when it becomes imperative to stimulate a suddenly failing heart as promptly as possible by drugs of the digitalis group

16 **Studies on Gastric Ulcer**—Even though anhemolytic streptococci are present in practically all gastric ulcers, Celler and Thalhimer are not convinced that these organisms have been proved as yet to be the factor which either initiates the ulceration or prevents healing Nevertheless, the constant presence of streptococci in this type of lesion is a suggestive fact and further experiments to determine their significance are being undertaken

7 Immunity to Yellow Fever H R Carter

2 **Ankylostomiasis**—The test suggested by Whyte depends on two facts (1) a trace of blood is constantly present in the feces of ankylostomiasis patients, and (2) there is a test for blood so sensitive as to reveal its presence in a dilution of 1 800,000 The only reagents employed are the test solution and hydrogen peroxid, and half a dozen specimens can be examined in ten minutes The reagent is prepared as follows 100 c c of a 20 per cent solution of caustic soda treated with 2 gm of phenolphthalein and 10 gm of zinc dust The bright rose colored solution is heated gradually until it has assumed a slightly yellowish tone The supernatant

fluid is poured off into a colored glass bottle and the access of air is prevented by the addition of a little liquid paraffin which floats on the top The test is made as follows To 2 c c of a watery solution of the feces is added 1 c c of the alkaline solution of phenolphthalin (namely, reduced, and therefore colorless, phenolphthalein) and then 1 drop of hydrogen peroxid In the presence of blood some of the phenolphthalin is reoxidized to phenolphthalein and a bright red color appears

3 **Value of Blood Counts in Diagnosis of Malaria**—Armstrong looks on a large mononuclear count of from 8 to 10 per cent as suspicious of convalescence from malaria, and one of 10 per cent or over as diagnostic of latent or actual infection He considers it safer to place the figure on which to diagnose malaria at a percentage at least double that found as an average in normal bloods in view of the many errors which may enter into such counts The differential blood count has been the means whereby a diagnosis for or against malaria was arrived at in 103 cases Forty-two cases were diagnosed as malaria by counts of 10 per cent or over, sixty-one cases were diagnosed as not malaria by low counts Of the forty-two cases, twenty-seven were correctly diagnosed Of the sixty one cases, six were definitely not malarial fifty-two were followed for some months and did not relapse, and in three no further decision could be made.

19 Simple Portable Refrigerating Box and Its Use as Temporary Incubator in Military Work. S Delepine.

16 **Amebic Dysentery in Man Who Had Never Left England.**—The feces of the patient whose case is discussed by Worster-Drought and Rosewarne were frequently examined throughout the illness, and active forms of *Entameba histolytica* were found up till the tenth day of treatment with emetin, but at no time afterward No cystic forms of the parasite were ever seen, although the motions were examined until three weeks after the patient's recovery, and no bacilli of the typhoid dysentery group were isolated The blood tested as regards agglutinating power against the dysenteric organisms "Shiga," "Flexner" and "Y" types proved negative. The tongue, which was furred from the beginning, continued so until about the seventh day with emetin injections, when it began to clear It was quite clean when they were stopped The liver was frequently examined, but at no time was any enlargement noted Abdominal pain persisted with diminishing severity until, practically, the motions were fully formed During the first ten days in the hospital he frequently complained of considerable pain after defecation The tenderness to the right of the umbilicus, mentioned on admission, had quite disappeared by the ninth day of emetin treatment, while that in the left iliac region did not disappear until three days after the motions were quite normal It is believed that this case was caused by a "carrier"

17 **Puerperal Sepsis Treated by Uterine Suction and Drainage**—Three cases are reported by Porritt in which he removed retained decidua from the uterus by means of the suction tube. He used a glass Budin's catheter to which the inlet end of a Higginson's enema syringe was attached It was passed into the uterus To secure the syringe to the Budin's catheter the inlet valve was removed The tube of the syringe between the bulb and the catheter was held firmly and the bulb squeezed, so as to drive out the contained air through the nozzle On releasing the pressure on the bulb, the valve behind the nozzle closed and prevented the return of the air There was then a vacuum in the syringe, and on releasing the pressure on the tube, between the bulb and the Budin's catheter, suction was exerted through the catheter within the uterus No air was drawn into the uterus, although the suction drew into the orifices of the catheter thick grumous, semipurulent masses, which were too big to pass through and, when the catheter was withdrawn, came with it Reintroduction of the catheter and suction drew out more of these thick pieces The vagina was syringed, and a gauze drain was inserted into the uterus Suction was applied to the uterus on two successive days The patients made a good recovery

29 *Treatment of Hepatic Failure in Yellow Fever, Malaria and Other Conditions. A Balfour
30 Hysterical Mutism in Boy A. J Hall
31 Case of Palpebral Chancre. H. J McGrigor and D M Livingstone

26 **Syphilis of Aorta**—Allbutt urges that in all necropsies on syphilitic cases one should submit the thoracic aorta, and especially the ascending arch, to minute scrutiny, to section and microscopic examination

28 **Opening of Lateral Ventricle**—Although the lateral ventricle was opened in the course of operations for removal of a bullet and indriven bone from the brain in both cases cited by Woolfenden, the patients survived and made an almost complete recovery One patient was normal except for a slight affection of the higher speech centers The other had some loss of sensation to pain on left side

29 **Hepatic Failure in Yellow Fever, Etc**—Balfour points out the necessity in cases of delayed chloroform poisoning and toxemic jaundice of keeping up the supply both of sugar and of protein food, the latter in peptonized form The former is insured by the administration of glucose. It can be given by the mouth or as rectal enemas, solutions of 5 or 10 per cent. being used If pure glucose cannot be obtained, preserved (candied) fruits may be given, or, indeed, sugar in any form The necessity for protein is met by administering enemas of peptonized beef tea, eggs, or other protein material.

33 *The Oscillometer as Index of Permeability of Accessible Arteries. (L exploration de la perméabilite des arteres des membres par l oscillometrie.) A Cawadias.

33 **The Oscillometer in Testing the Permeability of the Arteries**—Cawadias called attention in 1912 to the advantages of the use of Pachon's simple oscillometer in estimating the circulation through a vessel Others have confirmed his statements, and the war has brought innumerable cases in which the information thus derived has proved of paramount importance (Matas study of the various tests for the pe-

pose was published in The Journal, Oct 24, 1914, p 1441) The oscillometer findings on the side in question and on the sound side are compared, both for the arms and legs, and the extent of the oscillations is registered The findings differentiate functional from organic lesions, and permit exact localization The method is particularly useful in the study of aneurysms and as a guide to operative procedures

35 *Wire for Suturing Fractured Large Bones (La suture metallique dans les fractures des grand os) O Laurent
36 *Vaccination Against Typhoid in Russian Army L. A. Tarasse vitch

35 **Wire for Suturing Fractured Long Bones**—Laurent extols the advantages of stout silver wire for suturing the fractured femur or humerus It holds the parts firm and does not interfere at all with the production of callus while the twisted ends of the wire emerging between the lips of the wound provide an ideal drain One suture is generally enough, or one suture supplemented by a ligature He never used more than two sutures The outcome is far better than with metal plates which are always more or less irritating The wire seems to be borne without causing irritation during the month or two it is required and then it is easily removed The wire suture is particularly advantageous when the focus has had to be opened up to remove sequesters, etc Among the typical cases related is that of a fractured femur with excessive callus by the end of fifteen months After osteotomy the stumps were held together with wire rings not drawn tight and extension was applied The limb gained 10 cm in length by this means The provisional support from the wire rings enabled the muscles to regain their normal tonus and length under extension In the discussion, Delorme referring to the ideal drain provided by the twisted ends of the wire, says that this "exteriorized metallic suture" offers better chances for proper treatment of sequesters than other technics

36 **Vaccinations in the Russian Army**—Tarassevitch relates that the Russian Medical Association passed a resolution in December, 1914, approving of antityphoid vaccination but not insisting on its compulsory application The following five months, however, brought such an array of favorable testimony from different countries that the authorities made it compulsory in the army and more than 20,000 liters of vaccine had been used in military and civilian circles by February, 1916 A monovalent vaccine was used at first, and later one made from six or eight strains of typhoid bacilli Vaccination against cholera was also introduced, and over half a million men have already been thus vaccinated, but without official consecration Encouraged by Kabeshima's experience in Japan, Castellani's in Italy and some in Russia, attempts have been made to vaccinate at one time against both typhoid and cholera The reaction was no more intense than to one vaccine alone After two injections the serum agglutinated typhoid bacilli at 1 500 or 1 800 or even 1 2,000 Agglutination of cholera germs occurred only at 1 200 One entire army in the Caucasus was vaccinated in this way A group of 25,000 men at Moscow were vaccinated the same day against smallpox, typhoid and cholera, and only 5 per cent presented a moderate or severe reaction

38 *Influenza in Infants (La grippe chez le nourrisson. Etude clinique) R Raimondi.

38 **Influenza in Infants**—Raimondi has found that infants may be affected with grip toward the end of October and later, but it is usually mild and lasts only three or five days With the latter part of January it begins to be more virulent, and from March to May presents its severest forms, and then it seems to die out Incubation may take from twelve to forty-eight hours All the children present the same kinds of special manifestations at the same time, as a rule One month all will have the tracheal type, with otitis, while at another time the bronchopulmonary manifestations will predominate, or the nervous manifestations will overshadow other symptoms, or the digestive apparatus may bear the brunt of the attack. Winter grip in infants lasts from ten to fifteen days, in the spring from eight to ten days The highest and most tenacious fevers he has encountered were with the gastro-intestinal forms of grip, especially with involvement of the liver Grip is a touchstone locating by preference in the organs that are below par naturally He has had only one case of the nervous form of grip terminate fatally, the other children recovered in four or five days The same child may have several attacks during one winter Overheating and overcrowding favor its return Infants that are kept in the house are more liable to it and its complications He advises that at the first sign of trouble the mucous membranes must be sterilized with petrolatum or oil containing 2 per cent resorcin, cleansing the tongue and mouth with a boric acid or bicarbonate solution When the temperature goes up he gives a bath at 36 or 37 C (98 6 F) morning and night for five or eight minutes If there is bronchial involvement, five or six tablespoonfuls of mustard flour may be added to the water in the infant's bathtub If the temperature keeps high, a towel wet with water between 28 and 32 C (82 4 and 89 6 F) may be used to pack the child, with rubber outside This pack may be left undisturbed for thirty or forty minutes or until the child wakes up The pack may have mustard added at need He says that cupping, especially when there is bronchitis, is efficacious even for children only a few days old At the first signs of induration of the lung, he injects emetine, repeating the dose four or five days in succession (0 01 gm per 1 c c), 0 25 c c the first month up to 1 c c from ten months to a year old It is in grippal bronchopneumonia, he reiterates, that emetine hydrochlorid is most effectual The heart may have to be sustained with one or two injections a day of camphorated oil If the child is getting breast milk, the amounts should be reduced one half and milk should be diluted with water or mineral water or *bouillon de legumes* After four days without fever the child may be taken outdoors but not for longer than ten minutes at first, even on a fine day This must be done very cautiously to ward off relapses and complications He refrains from vaccinating infants during the special grip months, February and March, unless there are special reasons

May 7, XXXVII, No 37, pp 577 592

39 *Experimental Tetany During Pregnancy After Partial Removal of Parathyroids in Early Life (Tetania da insufficienza para tiroidea sperimentale nella gravidanza ed eclampsia) A Mas saglia

39 **Inadequate Parathyroid Functioning as Cause of Eclampsia**—The parathyroid theory of eclampsia and its corollary, parathyroid treatment, have long been advocated by a number of Italian and a few other writers Massaglia here reports two experiments which sustain this view, the findings confirming those previously obtained by Vassale and others in this line In the course of eighteen months Massaglia operated on two young female dogs, removing both external and one of the internal parathyroids, when they were about ten weeks old Each bore the operation well and grew up apparently healthy except for traces of albumin in the urine As the animals became gravid they seemed to thrive for about two months, and then each in turn developed severe tetany Massaglia and Vassale regard this experimental tetany as the equivalent of eclampsia in women, and the fact is emphasized that the tetany retrogressed under parathyroid treatment. In both, the parathyroid insufficiency evidently remained latent until roused by the stress of the pregnancy to active manifestations This is likewise the case with eclampsia in women, appearing only during a pregnancy or lactation The two bitches had two or three litters each and a tendency to tetany was

apparent also in the later pregnancies but less marked than at first. It soon subsided under parathyroid treatment and it was never apparent outside of a pregnancy

Policlinico, Rome

May XXIII Medical Section No 5 pp 129 160

40 *Symptomatic Importance of the Auricular Liver Pulse (Il significato semeiotico del polso epatico auricolare con speciale riguardo alla sua presenza nel ritmo di galoppo e nei vizi congeniti del cuore destro) C Pezzi
41 *When the Oculo-Cardiac Reflex Induces Extrasystoles (Riflesso oculocardiaco e estrasistoli) G B Ferralis and C Pezzi

40 **The Auricular Liver Pulse**—Pezzi has had opportunity to study the liver pulse in a number of cases, and was impressed by the constancy of the auricular type in cases of gallop rhythm and of congenital deformity in the right heart He gives the cardiograms and clinical details with the necropsy findings in four cases of gallop rhythm They confirm the assumption that gallop rhythm is the result in most cases of exaggerated functioning of the auricle It forces suddenly a large amount of blood into the ventricle, abruptly stretching it This sudden distention is facilitated by the walls of the ventricle being somewhat relaxed, and it causes a perceptible sound Pezzi's experience indicates that this presystolic liver pulse frequently accompanies chronic nephritis with gallop rhythm Hence the discovery of the auricular liver pulse with gallop rhythm does not have the import in respect to tricuspid stenosis that has hitherto been accepted It may be encountered also with congenital defects and other heart affections When noted with mitral disease, it suggests concomitant tricuspid mischief, but with gallop rhythm it does not necessarily indicate tricuspid deficiency, and it usually diminishes as the gallop rhythm returns to normal With congenital defects there is more liable to be tricuspid trouble when there is auricular liver pulsation

41 **Oculocardiac Reflex and Extrasystoles**—Ferralis and Pezzi have been studying on twenty persons the changes induced in the heart action by pressure on one or both eyeballs The stimulation of the vagus which it realizes may induce various reflex phenomena involving both heart and respiration, similar to chemical or electric stimulation of the nasal mucosa or the sensory terminals of the peripheral nerves at other points The work was undertaken to see whether the heart could be made to contract prematurely by pressure on the eyeballs The tests were positive in five of the twenty persons examined extrasystoles developing as the eyeballs were compressed This positive series demonstrates the connection between extrasystoles and the pneumogastric nerve. In three patients with chronic nephritis and high arterial tension, pressure on the eyeballs had a marked retarding action on the heart There was a tendency to spontaneous systoles in these cases but while pressure was being applied to the eyeballs no signs of premature contractions were evident This shows the complexity of the mechanism of extrasystole production by means of the vagus system, but the facts cited apparently demonstrate that the pneumogastric is capable of creating in the myocardium a condition that favors the occurrence of extrasystoles The spontaneous extrasystoles and those induced by pressure on the eyeball gave apparently identical tracings, showing a single center of impulse production

As extrasystoles are most common in the nervous, this speaks also for their reflex origin In some cases mere stimulation of the skin was enough to bring on premature contractions of the heart. These and other facts cited indicate that the pneumogastric has some action at least indirect, in producing or maintaining extrasystoles, and hence atropin may be regarded as indicated in cases of pathologic contractions of the heart Atropin has merely a symptomatic action but as such it is useful in addition to its accelerating influence on the heart action. Digitalis in certain cases of the kind does actual harm The details of the five positive cases are given In one, as pressure was applied to the eyeball, the ventricle began to beat automatically and irregularly, interrupted by an extrasystole The extrasystole occurred again in the same way on repeating the test later This patient was a girl of 12 with an apparently sound heart, but the electrocardiogram shows that there was a brief period of auricular fibrillation following the retarding phase This has been observed in animals when the stimulation of the pneumogastric surprised the nerve in a phase of overexcitability In one young woman with Banti's disease, the oculocardiac reflex was elicited with slight pressure on the eyeballs and the heart action was arrested for more than five seconds Only one extrasystole occurred and the contraction started in the left ventricle One extrasystole occurred also in a boy of 11 with mitral trouble left by articular rheumatism No spontaneous extrasystoles were observed A girl of 17 with acute rheumatism presented the liveliest reflex response of all to the oculocardiac test The heart action was retarded and once completely arrested for the longest period of any of the tests On two occasions there was a series of extrasystoles, starting in the right ventricle. This and similar cases testify that the action of infectious toxins on the pneumogastric may be responsible for more of the cardiovascular disturbances and hence that the latter may present a more favorable prognosis than is generally realized

46 Progress of Prohibition (Progresos del movimiento templario internacional) V Delfino

44 **Treatment of Vertebral Tuberculosis**—In concluding his general review of this subject, Jorge relates that he has performed the new operation for vertebral caries in a dozen cases and has found Albee's technic the simplest and best in its outcome Only in one case, in which the patient failed to get the proper after-treatment, the gibbus increased

Nederlandsch Tijdschrift voor Geneeskunde, Amsterdam

*April 29 I No 18 pp 1501 1588**

47 *Deafness and Heredity (Doofheid en erfelijkheid) H Burger
48 *Dermatology and Immunity Allergy and the Percutaneous Tuberculin Reaction W L L Carol Commenced in No 17
49 *Revaccination Neuralgia and Other Complications. (Revaccineeringsneuralgieen) G A M Van Wayenburg (De vierdaagsche ziekte na herenting) P W C M Busch

47 **Deafness and Heredity**—Burger discusses the various types of deafness that occur with a familial and inherited stamp, and shows that it is a mistake to diagnose otosclerosis merely on the basis of deafness inherited in the family The deafness is liable to be of quite another type, the trouble being in the sound-perceiving rather than in the sound-conducting apparatus In the labyrinth type the deafness comes on about 30 or 38 and slowly progresses to the age of 50 when it grows rapidly more complete The perception of high and low sounds, and bone and air conduction of sounds also differ from those with otosclerosis, as he describes in detail He charts three generations of a family tree showing twenty-nine members more or less hard of hearing or totally deaf out of a total of eighty-seven members not including three deaf in a previous generation He examined five of the deaf members of the family and found in two the progressive internal ear type of deafness, in another, premature senile deafness, and in two others the otosclerosis type of deafness It seems probable that in this family the organ of hearing is physiologically inferior and yields abnormally readily to morbid influences of various kinds This predisposition is inherited, not any special type of ear disease The predisposition may never encounter anything to rouse it to an active process and, if this does occur, the active process may be of different types in different members of the family with the inherited taint This assumption explains also, he says congenital deafmutism and he protests against the usual classification of this into the congenital and acquired types A deaf child that has never spoken is regarded as a congenital deafmute, and the possibility of deafmutism as

the result of a brain or meningeal inflammatory process in early infancy is quite overlooked

He is inclined to agree with Hammerschlag's dictum that the difference between deafmutism and progressive labyrinth deafness is one of degree only The anatomic basis for each is strikingly similar The fact that the labyrinth deafness does not develop until late in life is no sign that the sound-perceiving apparatus is not constitutionally inferior Other arguments in favor of this assumption are the remains of hearing in certain deafmutes, and the cases of congenital partial deafness—this is always of the labyrinth deafness type, and in his cases of this kind the deafness displayed no progressive tendency A still further argument is the labyrinth deafness which develops in the young and grows rapidly worse between 15 and 20 This latter has been observed as a familial affection Other facts cited in evidence are that Kuiper found atrophy of the stria vascularis cochleae in the internal ear of Japanese dancing mice, and Mayer found the same in persons with otosclerosis, while this has long been known to occur in deafmutes On the other hand, Politzer reported some years ago finding foci of new bone growth—spongiosa—in the labyrinth of deafmutes Koerner advised persons with otosclerosis to refrain from marrying, so as to carry their otosclerosis into the grave with them But Burger says that this prohibition, to be effectual, should extend also to the brothers and sisters of persons with otosclerosis, as they may have inherited the same tendency and be liable to transmit it, although this "determinant" has remained latent in them "In fact," he exclaims, "think of the latent dangerous determinants any one of us may be carrying around! At the twelfth generation each of us has 4,096 ancestors!"

49 **Revaccination Neuralgia.**—Van Wayenburg relates that during the recent extensive revaccination of the adult populace at Amsterdam, a number complained of severe neuralgic pains starting in the back and spreading to the stomach and abdomen They were like the pains of extensive herpes zoster, without the eruption, and in some cases were accompanied by vomiting He was unable to discover any tender points This neuralgia developed exactly on the fourteenth day in most cases, and lasted for five or six days, leaving merely a little lassitude The puzzling syndrome suggested kidney or gallstone colic or a pancreas affection He has been unable to find any record in the literature of this revaccination neuralgia

Hospitalstidende, Copenhagen

May 6 LIX, No 18, pp 417 440

50 *Peritonitis From Gonorrheal Disease of Ovaries and Tubes (Om akut diffus Peritonitis ved den gonorrhoiske Salpingo Oophoritis) P Zachariae

May 10, No 19, pp 441 464

51 *Cholecystitis Without Concretions in Paratyphoid Carrier (Et Tilfælde af Cholecystitis perforans sine concremento hos en Paratyfusbaciludskiller) J Nordentoft

52 *Single Intervention for Abortion and Preventing Further Conception (Abortus provocatus og Sterilisation i samme Séance) E Hauch

50 **Peritonitis from Gonorrheal Tube or Ovary Disease**—Zachariae reports three cases of acute diffuse peritonitis developing suddenly from exacerbation of chronic gonorrheal salpingitis practically latent hitherto No bacteriologic tests were made as negative findings are the rule at this stage of gonorrheal disease of the adnexa The aspect of the lesions rendered gonorrhea absolutely certain Whether to drain or not after the laparotomy, when the peritonitis is still in its first stage, is a matter of choice He drained in his one case of the kind but saw equally good results and healing by primary intention in similar cases in which the wound was sutured at once In his service, no morphin or other powerful sedative is given laparotomy patients until after flatus has been passed At most they get 1 gm aspirin Saline infusion or the Murphy drip is a routine measure Peritonitis from adnexa disease is of a milder course, as a rule, than when the source of the trouble is located higher in the abdomen The peritoneum's absorbing properties are most pronounced in the upper abdomen and grow less proportionally downward As to operative treatment, Zachariae comments on the remarkable success of bed rest, moist heat, douches, ichthyol tampons, etc., in inducing absorption of large effusions and tumors in the adnexa in a surprisingly large number of cases The impacted uterus grows more movable while the enlarged tubes dwindle in size until they can no longer be palpated He declares that as salpingitis is always bilateral and sooner or later both tubes will have to go, when removing one it is better to remove both He advises also to remove one or both ovaries, saying that possible resulting deficit phenomena are not to be considered in comparison with the disturbance liable to be set up by a pathologic ovary left behind Leaving the uterus does no harm as endometritis and metritis promptly subside after the diseased ovaries are gone Only when the uterus can be removed with ease is it wise to do it. According to some recent statistics from Schauta's clinic, conservative treatment failed and operative measures became necessary in 11 3 per cent of 6,000 *cases Radical treatment* ensured a permanent cure in 93 5 per cent, while this was realized with conservative measures only in 72 2 per cent The mortality was 3 5 per cent Widespread diffuse peritonitis from gonorrheal adnexa disease should be operated, even during the acute phase, but circumscribed peritonitis generally subsides under rest and conservative measures, with or without paracentesis But if the tumor persists unmodified through rational treatment kept up for months, then operative measures should be considered

51 **Perforating Cholecystitis in Paratyphoid Bacilli Carrier**—Nordentoft's patient was a primipara of 24 who had apparently recovered from paratyphoid a few weeks before Then symptoms developed suggesting acute appendicitis or cholecystitis The operation revealed the gallbladder distended and hard, with pus exuding from an opening in it. There was ulceration at two points and paratyphoid B bacilli were found in the gallbladder content No gallstones could be discovered and there was no jaundice No paratyphoid bacilli could be detected in the urine and stools later Nordentoft compares his case with the literature on cholecystitis without gallstones but he has been able to find only one case of paratyphoid infection of the biliary passages on record This was in a young woman with a history of both typhoid and paratyphoid The gallbladder was removed on account of attacks suggesting gallstone cholecystitis The patient ceased to pass paratyphoid bacilli in stools and urine thereafter, but cholecystectomy does not always prove effectual in this respect Pribram and Messerschmidt have had disappointing experiences in this line Kehr insists that when the gallbladder is removed for typhoid infection—as he has done in ten cases—the hepatic duct should be drained and the drainage kept up as long as the bacilli are found in the bile In Nordentoft's case, after a brief respite the patient had new attacks of pain, starting in the right hypochondrium and spreading through the back and shoulder, with jaundice and high fever and paratyphoid bacilli were found again in the stools It is evident that the paratyphoid bacilli are not restricted to the gallbladder but may lurk elsewhere in the body

52 **Abortion and Sterilization at One Operation**—Hauch analyzes the various procedures for this purpose and describes a method which he has applied in two cases, apparently demonstrating its efficiency It is simple and easy when the pregnancy is not past the third or fourth month Later than this it will have to be done by the abdominal route Through an anterior colpotomy, the bladder is detached and the peritoneum is opened The uterus is then palpated to see if it is loose and not bound down by adhesions If any are found they are broken up The fundus of the uterus is then brought down into the vagina and a small transverse incision is made in the fundus, and the ovum pops out entire as a rule With a curet the relics of the decidua are removed also, and the incision is sutured in two tiers The tubes are then resected for a space of 2 or 3 cm and the uterine stumps allowed to slip back under the peritoneum Two or three stitches are then taken in the peritoneum and the colpotomy incision is sutured The whole procedure is complete in twenty or thirty minutes

JOURNALS INDEXED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT JANUARY-JUNE, 1916

The following journals have been indexed in the Current Literature Department of THE JOURNAL during the past six months Any of the foreign journals, except those starred will be lent by THE JOURNAL to subscribers in the United States and to Fellows of the American Medical Association for a period not exceeding three days Only one journal may be borrowed at a time Requests for periodicals should be addressed to the Library of the American Medical Association and six cents in stamps should be enclosed This covers the average expense of mailing a journal Domestic journals can be obtained by sending the approximate amount direct to the respective publishers Thus most of the journals indexed are accessible to the general practitioner, no matter where he may be located

EXPLANATION OF THE USE OF THE INDEX

This is an index not only to the reading matter in The Journal, but also to original articles in the principal medical periodicals of this and other countries The reading matter appearing in The Journal is distinguished by the use of **black-faced numerals**

The letters used to explain in which department the matter indexed appears are as follows "E" Editorial, "C" Correspondence, "T" Therapeutics, "Ml," Medicolegal, "P," Propaganda for Reform, "ME," Medical Economics, "ab," abstract, the star (*) indicates an "Original Article" in The Journal.

This is a subject index and one should, therefore, look for the chief word, with the following exceptions "Book Notices," "Deaths" and "Society Proceedings" are indexed under these titles at the end of the letters "B" "D" and "S" Matter pertaining to the Association is indexed under "American Medical Association"

All matter is indexed under the most important word of the heading used in The Journal, and also under the subject heading For instance, abscess of the brain will be found under "abscess," as well as under "brain" Such titles as "ocular manifestations, etc.," have been indexed under "Eye" Cross references have been liberally used

An innovation in this index is the addition of the name of the author in brackets following the subject entry In case there is more than one author only the first is given

The figures in parentheses refer to the paragraph, the number following to the page in The Journal.

ACID hydrochloric as decolorizing agent for tubercle bacillus [Kellty] ***1619**

This reference is to an original article in The Journal, as shown both by the star and by the black-faced numerals indicating the page

ARSENIC in sodium cacodylate iron cacodylate and potassium arsenite amount of **1343**

This reference as indicated by the black-faced figures, is also in The Journal and on turning to page 1343 we find an answer to a question in the Department of Queries and Minor Notes

ABSCESS tongue [White] (86) **1167**

In this reference, the (86) indicates that the article is in the Current Literature Department and the fact that the page number is in black-faced type shows that the article is abstracted and discussed in The Journal Turning to page 1167, we find (86) refers to an article by J V White in the *Michigan State Medical Society Journal,* March

ABDOMEN wounds gunshot tabular statement of 500 [Wallace] (21) 1169

The fact that in this last reference the page is given in ordinary type indicates that only the title of the article is given Turning to page 1169 we find that the numeral (21) refers to a paper on that subject by C Wallace which appeared in the *Lancet,* March 4

In the Author's Index are the names of the authors of articles which have appeared in The Journal of the American Medical Association and of articles that have been listed from week to week in the Department of Current Medical Literature as having appeared in other journals The black-faced numerals indicate that the article is in The Journal, either in full or in abstract The star (*) preceding the page number indicates an original article.

SUBJECT INDEX

A

ABDERHALDEN SERODIAGNOSIS See Serodiagnosis
ABDOMEN acute [Baldwin] (100) 62 [Bookman] (100) 773 [Connell] (84) 1493
  acute pain in significance and mismanagement [Sheddan] **1348**—ab
  acute surgical [Lancer] (40) 1492
  acute typhoid complications of [Remsen] ***28**
  adhesions [Nifong] (110) 224
  contusions [Maclay] (126) 224
  cyst enormous due to retained testis [Outland] (122) 604
  cystic tumors report of 3 cases [Hoyt] (90) 1167
  diagnosis of diseases of sympathetic nervous system in [Binnie] (3) 1742
  differential diagnosis of lumbar and abdominal pains in women [Barron] (92) 604
  diseases of rôle of superior mesenteric vessels in [Hall] (109) **1168**
  foreign bodies in thorax and localization of [Rautenkrantz] (94) 1359
  foreign bodies left in and in surgical wounds [Mann] (142) 149
  free body found in woman s [Kropveld] (103) 392
  hydatid cysts growing in and protruding into umbilical hernia [Morton] (10) **1355**
  lipoma extraperitoneal [Geiger] (114) 224
  muscles of wall torsion injuries of report of cases [Boehme] (98) 223
  operation after treatment of [Abramson] (144) 1583
  operation epidemic cerebrospinal meningitis developing 22 hours after [Gaines] ***558**
  pain in soldier's manifestation of irritation of dorsal and lumbar spinal cord [Jaquet] (39) 387
  pain right sided causes of [Floersheim] (83) 1493
  Ptosis of See Splanchnoptosis
  surgery complications following [Walker] (134) 1060
  surgery emergent [Barry] (18) 1169
  surgery free omental grafts in [Freeman] (36) 382 (111) 536
  surgery local anesthesia in [Jacobson] (71) 772
  surgery mortality in [Rich] (25) 1820
  surgery obstetrics and gynecology relation of to public welfare [Cullen] ***239**
  surgery points of importance in [King] (112) 692
  tuberculosis operative [Funk] (41) 306
  wounds [Posner] (72) 609 [Hau] (40) 988
  wounds gunshot and shell [Cignozzi] (96) 696
  wounds gunshot recovery in severe case [Cignozzi] (83) 1173
  wounds gunshot report of cases [Harmon] (90) 604 [Hays] (118) 605
  wounds gunshot tabular statement of 500 [Wallace] (21) 1169
  wounds gunshot treatment of [Mayo Robson] (2) 149
  wounds immediate operations for [Murard] (70) 152 [Van Poole] (67) 383
  wounds in war [Cignozzi] (121) 453 [Grégoire] (40) 1894 [Abadie] (49) 1895
  wounds in war surgery 369
  wounds nonoperative treatment of good results of **1478**
  wounds operations for [Tisserand] (50) 1171
  wounds penetrating [Smith] (100) 459 [Meyer] (11) 461 [Fraser] (4) **1584** [Sampson] (3) 1660
  wounds perforating diagnosis of [Kausch] (53) 539
  wounds treatment of in field ambulance [Schwartz] (64) **1587**
  wounds treatment of in war [Quenu] (47) 538 [Strauss] (64) 1358 2000
ABNORMALITIES fetal syphilis and abortion [Adair] **1918**—ab
ABORTION and sterilization at one operation [Hauch] (52) 2130
  criminal and medical profession [Ball] (33) 840
  criminal injury of vesicovaginal wall during [Länsimäki] (95) 465
  criminal present status of [Benthin] (122) 155
  incomplete medical treatment of, [O Connor] (84) 223
  induced [Dakin] (33) 771
  infectious production of hyperimmune serum for in mares [Good] (52) 1273
  license revoked because of alleged procurement of, 680—Ml
  perforation of uterus after [Heimann] (40) 1496
  septic bacteriology and treatment of puerperal infection and [Fisher] (72) **1493**
  syphilis and fetal abnormalities, [Adair] **1818**—ab
ABSCESS See also Cellulitis Phlegmon
ABSCESS appendiceal pelvic rectal drainage of case reports [Schrager] (108) 1354
  blind dental painless grave danger of emetin flash [Adair] **1490**—ab
  brain multiple in infants, [Holmes] (21) **1889**
  brain multiple of otitic origin [Myers] (93) 459
  brain multiple operation recovery [Guttman] (26) 1352
  brain of otitic origin unusual case of [Maxey] (119) **1168**
  brain removing splinters of bone after wounds of skull and [Perthes] (97) 991
  brain tardy from projectile recovery after operation [Mendelsson] (18) 386
  brain with unusual findings case of [Richards] (17) 532
  cerebellar mastoiditis with lateral sinus thrombosis and operation recovery [Foster] (150) 1583
  cerebral development 8 years after operation for otitis media and mastoiditis followed by meningitis [Kopetzky] (18) 532
  diphtheroid bacillus of Preisz Nocard from equine bovine and ovine [Hall] (78) 534
  drainage of small [Crane] 208—C
ABSCESS epidural acute exacerbation of mastoiditis with cholesteatoma and purulent pachymeningitis [Loughran] (31) 532
  intra abdominal 5 teaspoons removed from after perforating small intestine [Tilton] (114) 63
  ischiorectal from fish bone case of [Saphir] (61) 1493
  liver amebic emetin for [Dopter] (37) **1277**
  liver tuberculous [Saltzman] (91) 465
  liver with trench diarrhea [Rathery] (40) 1662
  lungs localization of [Petersen] (115) 70
  mastoid blood clot dressing in closing wound in operations for [Wheelock] (74) 921
  mastoid infective thrombosis of lateral sinus and jugular vein with [Bryan] (15) 532
  metastatic and pyelocystitis following tonsillitis [Mills] (131) 1431
  multiple and erysipelas migrans in 6 months' old infant vaccines successful in [Fischer] (46) 1493
  myocardium resulting in aortic leakage into right heart [Rudolf] (26) 843
  neck healing of without scars under filiform drainage [Chaput] (68) **1825**
  otogenous subperiosteal in temporal region 31 cases [Lund] (103) 1828
  pelvic pain in left side with appendicitis sign of rupture of [Proust] (44) 227
  perinephritic [Braasch] (19) 770
  periprostatic of tuberculous origin [McKeon] (115) 536
  perisinuous and sinus thrombosis [Becker] (76) 1493
  peritonsillar tonsillectomy during acute stage of [Barnes] (18) 220
  pyriform [Rovsing] (116) **1752**
  retro uterine in pouch of Douglas bacteriologic and clinical study of [Jägerroos] (92 100) **1065**
  subphrenic [Hall] (49) 1166

ABSCESS temporosphenoidal, with unusual complications, [Leshure] (25) 1352
  tongue [Prenn] (30) 603, [White] (86) 1167
  tuberculous of gluteal region simulating pyemic abscess following lateral sinus thrombosis, [McKenzie] (14) 922
  tuberculous *oxygen treatment of*, [Gendron] (38) 538
ACADEMY Italian Physico Chemical, 673—P
  of Medicine, election of 2 foreign associates to, 1562
ACANTHOCEPHALA from fresh water hosts seasonal distribution of [Van Cleave] (53) 1744
ACCIDENTS, impaired physical condition and [Farnum] (5) 2037
  impairment of earning capacity from, nervous consequences of, [Horn] (89) 541
  industrial, and workman's compensation, [Zannini] (91) 231
  motor, in darkened streets, 753
  railway, in 1915, 287
  safeguards and compensation in federal service 2116—ab
ACCOMMODATION See Eye Accommodation
ACETABULUM, fracture of case of [Borden] (99) 2041
ACETONEMIA nondiabetic, [Wilkinson] (83) 1493
  periodical vomiting with, [Frølich] (67) 1498
ACETONURIA and contagious diseases [Blodgett] (39) 1492
ACET-THEOPHYLLIN sodium 117
ACETYLENE gas poisoning severe, 2 cases [Nicol] (64) 1664
ACHONDROPLASIA, *deforming* hereditary, [Ashhurst] (37) 689
  fetal 2 cases [Clopatt] (99) 1066
ACHROMATISM, *fundamentals of*, [Prentice] (139) 1431
ACID a-aminocaproic normal, fate of in phlorhizinized dog, [Greenwald] (55) 1821
  acetic urine albumin soluble in study of [Cavazzani] (76) 1664
  acetic-sulphuric, test for skatol [Hatta] (118) 929
  acetyl-salicylic, edema idiosyncrasy to, [af Klercker] (125) 1282
  acetyl salicylic worthless substitute for 522
  amino acid a-nitrogen, estimation of colorimetric method for, [Harding] (98) 1430
  amino, and growth 958—E
  amino dosage of polypeptids and, in blood, [Amann] (24) 2043
  amino, liver in formation of urea from, [Jansen] (121) 317
  amino, minimum for maintenance and growth, [Osborne] (48) 1821
  betahydroxybutyric and ketones in urine of normal children, [Veeder] (6) 1351
  boric plus potassium bitartrate for disinfection of wounds [Cossu] (55) 463
  boric, poisoning, case of, [Willson] (193) 63
  Carbolic See Phenol
  cell penetration by [Crozier] (50) 1057
  diacetic or beta oxybutyric fatal diabetic coma without [McCaskey] *350
  formic and eczema 137—C
  glucosaminoheptonic [Levene] (60) 533
  glycuronic in urine as index of liver functioning [Gautier] (69) 1587
  hippuric synthesis of in animal organism [Lewis] (49) 1821
  hydrochlorous, as decolorizing agent for tubercle bacillus, [Kellty] *1619
  hydrocyanic, in plant tissues, [Alsberg] (60) 1821
  hypochlorous, discovery of properties of, by French chemists, 430—E
  hypochlorous, in acute toxemia secondary to gas gangrene [*Fraser*] (17) 606
  hypochlorous, in conjunctivitis, [Jefferson] (13) 1169
  hypochlorous, in gunshot wounds, [Miles] (11) 842
  hypochlorous, in lacerated wound of thigh, case of, [Miles] (14) 842
  hypochlorous, intravenous injection of simple method, [Graham] (12) 1892
ACID, hypochlorous, surgical and antiseptic values of [Fraser] (14) 1276 [*Newman*] (10) 1823

Book Notices

THE DUCTLESS GLANDULAR DISEASES. By Wilhelm Falta. Translated and Edited by Milton K. Meyers, M.D., Neurologist to the Lebanon Hospital, Philadelphia. Foreword by Archibald E. Garrod, M.D., F.R.C.P., F.R.S., Physician to St. Bartholomew's Hospital, London. Second Edition. Cloth. Price $7 net. Pp. 674, with 101 illustrations. Philadelphia: P. Blakiston's Son & Co., 1916.

The book contains an introductory chapter on the embryology and general physiologic relations of the ductless glands. This is followed by two chapters on the diseases of the thyroids. The diseases of the parathyroids, thymus, hypophysis, pineal body, suprarenals, pancreas and the gonads are each accorded a chapter. There is one chapter on pluriglandular diseases (multiple glandular sclerosis, giantism), and three chapters on diseases which, according to Falta, are not directly traced to disarrangement of the endocrine glands, such as status lymphaticus, infantilism, mongolism, chondrodystrophy and the different forms of obesity.

A careful perusal of the volume leaves the impression that the author is too dogmatic in a field in which so much is as yet unsettled. Thus he states (p. 24) as demonstrated facts that "all the ductless glands are supplied with vegetative nerves and their function is thus in a great measure regulated by the nervous system" and further that "the ductless glandular system influences the excitability of the vegetative (sympathetic) nervous system by the hormones they give off to the circulation." Both of these generalizations as applied to all the endocrine glands are quite in advance of facts, and time may prove them in part contrary to facts.

Falta regards all endocrine gland diseases as due either to a hypo-activity or a hyperactivity of the glands. Thus he speaks of diseases due to hyperfunction of the parathyroids and the suprarenals, hypergenitalism, etc. This is logical and may be a useful working hypothesis, but the author does not always distinguish between working hypotheses and conclusions based on facts. In the chapter on diseases of the suprarenals the author bases all his discussion on the old vascular tonus theory of suprarenal function despite the fact that this theory is rendered untenable by the work of Cannon, Hoskins and others in recent years. The absence of even a reference to such fundamental work can hardly be excused in a monograph of the ductless glands published in 1916.

The numerous illustrations are excellent and would in some cases have been more useful if accompanied by more detailed explanations. The sixty-eight pages of references constitute one of the most useful parts of the volume. Many important papers are not found in this list but are cited in the addenda given by the American editor at the end of each chapter.

COLON HYGIENE. Comprising New and Important Facts Concerning the Physiology of the Colon and an Account of Practical and Successful Methods of Combating Intestinal Inactivity and Toxemia. J. H. Kellogg, M.D., LL.D., Superintendent of the Battle Creek Sanitarium. Cloth. Price $2 net. Pp. 393. Battle Creek: Good Health Publishing Company, 1915.

This book is written for the layman, yet "the writer does not desire to convey the impression that the sufferer from severe constipation can safely undertake to act as his own physician but rather to enable him to cooperate with the wise up-to-date physician." The subject of constipation is discussed thoroughly in all its phases, but what is said could have been said in much less space, had there not been so much repetition. Many statements are repeated over and over again. The author may have thought this necessary to impress them on the lay mind, but too much repetition becomes tiresome even to the layman. If the object of the book is to make the layman believe that he is sick and that his sickness is due to the fact that his bowels do not move often enough it will probably accomplish its purpose. It is quite proverbial that when a lot of symptoms are detailed in an enticing manner to the layman the imagination immediately becomes active, and the symptoms are at once appropriated and become a part of the individual. If such is the case when a few symptoms are mentioned what must be the effect when almost all of the ills to which flesh is heir are vividly described as due to constipation, "a disease so universal in civilized communities," that it "may justly be looked upon as among the fundamental causes of the race degeneracy which is becoming every day more apparent in all highly civilized communities." It is certainly assuming much to say that all highly civilized races are degenerating. It is freely admitted that constipation is a very common complaint, but its consequences are not nearly so calamitous as a few writers would have us believe. It seems to be a fad nowadays to attack the colon. Just because a few patients have had their colons removed and have lived, behold, the colon is a useless organ, the changes taking place in it are the cause of old age, ergo take out the colon and live forever. Constipation is a common condition, and it is frequently harmful, but it is not the cause of all the ails of the flesh. If the constipated layman could only skip the parts that are overdrawn and read those that relate to proper exercises, diet, etc., he might profit by the book.

Miscellany

The Industrial Incidence of Tuberculosis

Some of the state laws provide for compensation to workmen not merely for accidental injury, but for any disability arising out of and in the course of employment, that is, compensation for disease, provided it can be shown to be due to the work in which the employee is engaged. This makes the question of the incidence of disease in industry an important one in the administration of the law. It is also a complex problem, for a man who is failing in health owing to his occupation may change employment repeatedly, and the occupation in which he is engaged when he finally becomes incapacitated may not be responsible for his condition. E. F. McSweeney, who, with Prof. Selskar M. Gunn, was commissioned by the Massachusetts State Board of Labor and Industry and the Industrial Accident Board to investigate the industrial bearings of tuberculosis, in a preliminary report (Industry and Tuberculosis, *Journal of Outdoor Life*, April, 1916, p. 99) says that labor and occupation undoubtedly constitute an important factor in the "causes" of tuberculosis, but that no particular kind of work can be said to "cause" the disease. In the records of all the hospitals and sanatoriums examined women of the home—housewives and domestics—led the list of occupational classes affected by tuberculosis, constituting from 22 to 28 per cent. of the total. Clerks, including salespeople, bookkeepers and stenographers, came next on the list in all sets of records. These two classes—houseworkers and clerks—show the influence of indoor confinement in the production of tuberculosis. Day laborers—workers on streets, roads, railroads, subway excavation, etc.—constituted the third largest class; in their case the favorable influence of outdoor occupation was offset by exposure to dust, long and uncertain hours, night work, temptation to drink, etc. Miscellaneous factory workers, including those employed in the making of buttons, corsets and typewriters, but not in the leading industries of the state, came next. The shoeworkers were fifth on the list, furnishing more tuberculosis patients than any other single industry in the state. Dust and poisons from blacking, dyes, polishes, etc., were regarded as the unhygienic elements in this industry. Mill operatives—workers in the cotton, hosiery, paper, silk, wool and worsted industries—came next. Teamsters, waiters and waitresses, seamstresses and dressmakers; tailors and tailoresses, stoneworkers, woodworkers, bakers, metalworkers, printers and jewelers are among the workers whose occupations show unduly high tuberculosis incidence. Tuberculosis seems to be the most serious occupational disease, but, owing to the difficulty of putting exact responsibility for the condition on the industry in which it occurs, McSweeney believes that tuberculosis workers will seldom be able to benefit from the Massachusetts compensation law. There is much need, he concludes, for the study of the exact effect of occupation on disease.

Medicolegal

Injury Followed by Gonorrheal Infection—Not Loss of Eye

(Cline vs Studebaker Corporation et al (Mich), 155 N W R 519)

The Supreme Court of Michigan reverses and sets aside an award, under the workmen's compensation act, that treated the injury as the loss of an eye, rather than as a partial loss The court says that the fact that a piece of steel flew into the claimant's right eye in the course of his employment seemed fairly well established But it was not shown that this flake of steel directly caused the subsequent impairment of vision, that, on the contrary, must be attributed to a gonorrheal infection which set in Nor was it probable, from the testimony of the physicians, that the germ which caused the infection was on the steel itself They stated, however, that such a germ might get into the eye from a towel, from washing utensils, from the straps or rails of a street car, and in similar ways The burden was therefore on the claimant to show by a preponderance of evidence that the infection arose out of and in the course of his employment, instead of at some other time and in some other way In short, under the circumstances, it was for the claimant to show that the infection was connected with the accidental entry of the steel into his eye In instances like this, where the claimant himself is personally free from the disease, it is hardly possible that the source of infection can be shown absolutely by direct evidence Nor is that necessary That the claimant was himself free from the disease up to the time of the accident was the testimony of the physician who attended him, and the finding of the industrial accident board The gonorrheal germ must have come from some outside source It must also have been received not later than the time of the accident to have developed into the condition found by the physician two days afterward, according to his testimony These conditions, in connection with the fact, as shown, that an injured eye is more susceptible to the infection than a normal eye, and with the further fact that at once, after the accident, a fellow workman examined the eye, using for the purpose a match wrapped in a piece of cloth, created a considerable degree of probability that the germ got into the eye in the attempt to remove the steel And this probability was sufficient to warrant the board in finding that "the infection which destroyed the sight of the eye is not reasonably accounted for except as coming through or resulting from the accident" If the germ was introduced in an attempt to remove the flake of steel from the eye, it was a direct consequence of the accident, and arose out of and in the course of the employment The attempt to remove the particle of steel was a natural and necessary result of its entry into the eye The net result of tests by two experts was that, when using proper glasses, the claimant had 50 per cent of his sight, while without them he had only 10 per cent Under these circumstances it seems impossible to say that the injury resulted in the loss of the eye The use of glasses is a very ordinary occurrence, both by the young and the old Ninety per cent of the sight is not lost when it can be diminished to 50 per cent by the use of common appliances And it is the duty of the sufferer to minimize the injury as much as he reasonably may The statute does not provide compensation for the partial loss of an eye under such circumstances

Restricting the Use of Second Hand Material to Protect Public Health

(People vs Weiner (Ill), 110 N E R 870)

The Supreme Court of Illinois reverses a judgment of conviction of the defendant of violating the statute which took effect July 1, 1915, regulating the making and renovating of mattresses, quilts or bed comforters, and regulating the sale thereof The court says that the provisions of Sections 1 and 2 of the statute are arbitrary and unreasonable, and must be held unconstitutional and void The evidence showed that second hand bedding does not necessarily convey infectious or contagious diseases, and that a lawful business of selling or dealing in such may be carried on without danger to the public health It is the nature of the previous use, condition or exposure in respect to contagious or infectious diseases which makes the use of second hand material dangerous in the manufacture of mattresses, comforters and quilts, and not the mere fact of the previous use of such material by other persons It is eminently proper to require that material be free from germs of contagion and infection before being used in mattresses, comforters or quilts, whether the material be second hand or new, but the possible danger to health or safety does not justify the absolute prohibition of a useful industry or practice where the danger can be dealt with by regulation The statute does not attempt to prohibit the use of second hand mattresses, but does prevent their ever again being used in the manufacture of other mattresses which are to be sold To prohibit absolutely the use of such material in the manufacture of mattresses for sale when not inherently dangerous and when it may be rendered safe by reasonable regulation is an invasion of personal and property rights within the meaning of the federal and state constitutions Again, it was argued that there was a discrimination between the manufacturers and dealers in pillows and manufacturers and dealers in mattresses, comforters and quilts, especially after they had been used, as there was no provision made as to pillows, that, so far as this act was concerned, material made second hand in the same way as the material in mattresses might again be made into pillows and sold without any regulation whatever Under the decisions of this state this is class legislation But the provision in Section 3 of the act requiring that material used in remaking mattresses, quilts and comforters for the person's own use must be sterilized does not violate any constitutional prohibition, and is a proper exercise of the police power That same requirement could be made in an act with reference to the manufacture and sale of mattresses Regulations to prevent fraud and deceit in such manufacture and sale could be very readily provided, so as to protect the public, without prohibiting the use of second hand material if properly renovated and sterilized

A Waiver of Privilege

(Dewey vs Cohoes & L Bridge Co (N Y), 155 N Y Supp 887)

The Supreme Court of New York, Appellate Division, Third Department, reverses a judgment obtained by the plaintiff on account of a personal injury, and grants a new trial, because of what it holds was error in sustaining an objection to a hospital surgeon testifying for the defendant The court says that the plaintiff swore to the facts of the injury and his condition, and called physicians who had attended him who swore minutely as to his condition Some of them took, or assisted in taking, roentgenograms of the organs and parts of the body claimed to be injured The testimony of his physicians put before the jury, with great minuteness and circumstance, his physical condition, especially at the time when he was at the hospital The defendant called a surgeon, connected with the hospital, who had examined the plaintiff there at his request, and he was asked, "What did you find the man was suffering from?" Objection to the question was sustained, but the court thinks that the actual physical condition of the plaintiff while he was at the hospital was very material, and the defendant had the right to have the testimony of the surgeon on that subject The plaintiff put his person before the jury as a basis for damages, and had it described by his physicians, and thereby waived any privilege, not only of the physicians he called, but also of other physicians, who examined him about the same time It did not appear that the surgeon called by the defendant made his examination at the same time that the other physicians made theirs, but it does not seem that that fact was controlling The examination was at the same time the doctor was treating him for the same trouble It seems unfair that he could call certain of his physicians and refuse to permit others to testify, on the ground of professional privilege

MEDICAL SOCIETY OF THE STATE OF NEW YORK

One Hundred and Tenth Annual Meeting held at Saratoga Springs May 16-18 1916

The President, Dr. W Stanton Gleason Newburgh, in the Chair

Examination of Eyes of Schoolchildren

Dr. F Park Lewis Buffalo In order that we may know how much importance to attach to defects of the eyes we must have exact data as to their incidence their character their corrigibility and their influence in retarding the normal progress of a large number of individuals Careful work has been done in Pennsylvania In the report of 1914-1915 in the fourth class districts, 269 199 pupils were inspected visual defects were found in 83 748 or 17 8 per cent , 5 512 pupils had other eye defects What disposition shall be made of such pupils in the classification and arrangement of the school? The methods employed in the correction of eye defects are not always well done when the work is done for a poor child the patient is usually referred either to a public dispensary or to an optician The refractive work done in public dispensaries is too frequently done in a hurried and careless way

Very few children beginning school life know how the eyes should be used and it was suggested by a committee chosen by the National Educational Association and later by a committee of women school principals in New York City that the child when he begins to use books be taught how they should be used and the following simple recommendations be printed on the first blank page of every schoolbook

1 Take care of your sight upon it depends much of your safety and success in life
2 Always hold your head up when you read
3 Hold your book 14 inches from your face
4 Be sure that the light is clear and good
5 Never read in the twilight in a moving car or in a reclining position.
6 Never read with the sun shining directly on the book
7 Never face the light in reading
8 Let the light come from behind you or over the left shoulder
9 Avoid books or papers printed indistinctly or in small type.
10 Rest your eyes frequently by looking away from the book
11 Cleanse the eyes night and morning with pure water
12 Never rub your eyes with your hands or an unclean towel handkerchief or cloth

Another reason why permanent records should be made of all schoolchildren s eyes is found in the workmen's compensation act. With the assumption of responsibility on the part of the employer for injuries received by the employee in the performance of his duties there must be an assurance of the existence of a normal physical condition on the part of the workman who is thus protected, but if there is an abnormal condition present this must be known in order that the extent of the injury may be ascertained If the examinations of the eyes of schoolchildren are standardized, and if these records are permanent and available, they would give us the important and necessary data concerning every individual in the state

Practical Experiences in Medical Inspections in Rural Sections

Dr William A Howe, Albany During the first year of the administration of the medical inspection law, many impressive and varied experiences have arisen Many grateful parents have written the department thanking it for the wonderful relief extended to their children Thousands of children have been placed on a higher plane of physical fitness, thus enabling them to make more normal progress in school Two children with congenital cataract, whose vision amounted to practically nothing, have been operated on successfully restored to vision, and placed in school, where satisfactory progress is now being made Three others had so little vision as to render regular school work impossible Two children of school age have recently been placed in the New York School for the Blind at Batavia, where they will receive an academic education, be taught some vocation and be made self-sustaining citizens Another child with a badly disabled foot following infantile paralysis has been successfully treated by tendon transplantation Two pupils, who were incorrigible, impertinent, backward and unmanageable in school improved promptly after the removal of septic tonsils and obstructing adenoids Several cases of tuberculosis have been found among our teachers while in one district this disease had existed among the pupils for nearly fourteen years Many pupils throughout the state in either the pretuberculous or incipient stage of the disease have been greatly benefited by sanitary or institutional treatment A few days ago one village district reported fifty cases of obstructed breathing among children of foreign parentage or from dependent families These will be referred to specialists who have generously designated free services to deserving children In another village certain schoolrooms are being utilized as a temporary hospital in which, under the supervision of an experienced nurse, physicians and surgeons are administering relief to local children In Schenectady, seven rural schools have united in the employment of a school nurse who is devoting her entire time to inspecting the children and to the improvement of school and home conditions This nurse though employed only for the past three months, has already accomplished such splendid results as fully to demonstrate the practical value of such services In another section of the state we find a rural teacher referring many of her children to specialists in Buffalo where physical defects have been relieved thus insuring to pupils far greater progress in school

The Neuropathic Child

Dr Edward B Angell, Rochester The best description of the neuropathic child is that given by Dr Francis Warner of London England who has examined 100 000 schoolchildren He describes the characteristic manifestations of the neuropathic condition, as headache difficulty in getting to sleep grinding of the teeth, delicate physical condition without actual disease, lack of appetite, and tendency to be fatigued easily These children are generally well made in body and have good heads, and they have well cut features and fine skin and usually light complexions There is a weakness and an overspontaneity There are uncontrolled movements without coordination Impressionability and imitativeness show that the child s mind is impressed by what it sees With growth development there is power to arrest the motor concept and to modify or even deny its inhibition Requiring the child to raise its arms and hold them straight out in front in a horizontal position is a test of the nervous condition and the degree of fatigue. If the latter are present the child does not hold both arms parallel, or drops one arm, or one hand, or in the very neurotic the knuckles of the hand are pointed directly backward Self-control cannot be established too thoroughly for the growing child since without self-control there is an unstable equilibrium which later gives rise to the vagaries of neurasthenia and hysteria If one studies the nervous child he will find that his position may be one of erectness of assurance or defiance or it may be dropping and self-conscious, or one of weariness, or fatigue the latter being more common in girls Another habit easily acquired by the nervous child is that of introspection, and this leads later to unstable equilibrium and self-consciousness to the detriment of efficient mental activity I have observed seventy-five or eighty cases of typical nervous children and have found that alcoholism and insanity have entered in as factors in about one third of the cases, while the arthritic diathesis was present in about 30 per cent In only one case did I find tuberculosis in the family, but tuberculosis probably played a more important part than this indicated in the transmission of an unstable nervous constitution In about 25 per cent of these cases the condition can be traced to abnormalities in pregnancy or delivery Faulty metabolism such as constipation, headaches mental depression, irritability and a poor circulation are characteristic evidences of disturbed nutrition There is defective nutrition in about two thirds of the cases, and nearly one third are the victims of night terrors Fresh air is a most important factor in the treatment of this type of child The Boy Scout movement is excellent in developing the correlation of muscular and physical activities and teaching the boy self-control and how to adjust himself to life

The Open Air School Child as a Type

Dr. Edward Durney, Buffalo Children of a certain type are being segregated and are regarded as unsuitable for treatment in fresh air schools They are the children who are living under the wrong conditions of life, who have a heredity of alcoholism or epilepsy, are the subjects of faulty nutrition and have abnormal nervous activities Some of these children are the spoiled children of the so-called better families The nervous conditions in these children range anywhere from chorea to partial recovery from infantile paralysis The defects brought out by present methods of school inspection must be corrected if the children are to receive the full benefit of the fresh air treatment. The attitude of the children themselves toward these schools is the best argument in their favor Records of the weight of these children have been kept, and the gain in weight that has been shown is a positive index of the improvement in their condition The change from the ordinary school to the fresh air school is frequently accompanied by an increased interest in both work and play There is often a mental deficiency accompanying the physical defects, and with the methods used in the open air schools these defects are sometimes benefited or removed Among the children who would be improved by the open air school may be included a large number of children in the ordinary school

The Effect of Malformations and Infection of the Oral Cavity of the Child on Its Future Health

Dr. Stephen Palmore, Poughkeepsie Nothing is so important as the hygiene of the mouth of boys and girls, for on that depends the health of the men and the women of tomorrow Malformations are of the utmost importance, and are so common that one rarely sees a normal conformation of the mouth and teeth This I attribute to the mixing of the races and the fact that not enough time has elapsed to evolve a definite type To the proper molding of the human face a full complement of teeth is requisite Where there is malformation there is malocclusion and the latter condition is the rule rather than the exception The anatomy of the mouth and teeth is such that the loss of one tooth ultimately disturbs the balance of the whole Therefore, one cause of dental deformity is the loss of one tooth Thumb, lip and tongue sucking are another cause of deformity, bringing about malocclusion and a narrowing of the palatal arch, and nasal obstruction It is important, therefore, for the rhinologist to work with the dental surgeon when it comes to the treatment of mouth deformities involving the palatal arch In the demonstration of alveolar abscesses, the Roentgen ray has been a great help Pyorrhea alveolaris is not a disease of childhood, but with proper prophylaxis and the correction of malocclusions it can be prevented A clean tooth never decays, teeth in good occlusion are easy to keep clean, and therefore teeth in good occlusion never decay

DISCUSSION

Dr John L Heffron, Syracuse Refraction work is being done in Buffalo by a volunteer staff of dispensary doctors This year the Department of Education of the city has undertaken to employ these doctors from the dispensary at a nominal salary as part time medical inspectors to care for the eyes of the schoolchildren These men have had a good training in the dispensary, and as a consequence the school board gets good service

Dr Moses Keschner, New York As a rule, the general practitioner gives the neuropathic child scant attention When the mother brings such a child to me complaining of night terrors, bed wetting and nervous symptoms, I usually prescribe bromids and Fowler's solution and let it go at that In this class of children one often has a greater problem to solve than in actual organic disease The many details of environment and economics must be taken into consideration These are the children that later fill the asylum, homes for epileptics and reformatories, and their treatment should be regarded as an important and serious problem

Dr B W Whitbeck, New York The records of the New York schools show that about 60 per cent of the children present a condition of weak foot or flatfoot I have inquired at Washington as to the disabling effects of flatfoot in the United States Army and Navy, and find that they are throwing out many candidates on account of this defect Children with this defect are often backward in school, are tired, and will not play or eat I saw a boy, who had been treated with tonics, sent to an oculist who prescribed glasses for the relief of headache but all without avail The boy finally went to the family physician who found that he had a hollow back and flat feet This boy was treated with proper orthopedic appliances, and in a short time his general condition improved and he took off his glasses It is not merely a question of whether the foot is flat but whether it is functionating It is not so much a question as to whether the feet are flat as whether they are weak Many persons have flat feet and yet go through life without symptoms It all depends on whether or not the foot functions

Dr Frank Overton, Patchogue I have been interested in the reference to cases in which private physicians failed to detect the defects of schoolchildren In my own town there is efficient cooperation between the private physicians and the school inspectors I understand that there are places where there is not this cooperation It is one of the functions of this society to bring about such cooperation

Dr Edward B Angell, Rochester We should call the attention of the general practitioner to these cases There are many conditions that I did not refer to in my paper, I did not refer to dementia praecox. It is sometimes very difficult to tell whether one is dealing with neurasthenia or dementia praecox I have had a case of dyspituitarism in a boy who presented feminine characteristics and an utter lack of any sense of responsibility In this case treatment with pituitary extract has brought about great improvement both physically and mentally Such cases show that something can be done by a careful study of these cases in youth The points brought out as to the relation between flatfoot and hollow back and their effect on the general health are very important Dr Warner, of London, to whom reference was made in my paper, states that he has found many cases of hollow back and has observed that it bears some relation to flatfoot, but he has not attempted to explain it

Dr Julius Schiller, Amsterdam Physicians know what should be done for these children, but they are unable to do it because they do not have the means The medical inspector knows the children in his schools who need glasses or need to have other defects corrected, but the parents do not have the means to have the work done They cannot do much until basic economic conditions in the home are improved

Dr A P Squire, Rotterdam Has any one tested for the Wassermann reaction in children having Hutchinson's teeth? What does this sign signify in schoolchildren?

Dr John L Heffron, Syracuse I feel that the sign known as Hutchinson's teeth is sometimes due to a delay in the eruption of the teeth I have not been able to discover that any one has made observations on this point

Dr William A. Howe, Albany The state department of health stands ready to make the Wassermann tests They have found a reasonable number of children with syphilis and have treated them in a successful manner

Dr B W Whitbeck, New York The examination of the teeth is very important In orthopedic work all patients with arthritis are examined by the Roentgen ray in order to ascertain the condition of the teeth When a focus of infection is found, the patient is put under treatment until this condition clears up

Dr L Duncan Bulkley, New York Nothing has been said as to the importance of thorough mastication Mothers should be instructed to teach children to chew their food properly Some device such as aluminum or celluloid balls or a cardboard cuff around the upper arm, would prevent the child from thumb sucking

(To be continued)

AMERICAN GYNECOLOGICAL SOCIETY

Forty First Annual Meeting held at Washington D C May 9 11 1916

The President, Dr. J Wesley Bovee, Washington, D C., in the Chair

SYMPOSIUM ON SYPHILIS IN ITS RELATION TO OBSTETRIC AND GYNECOLOGIC PRACTICE

Syphilis in Its Relation to Obstetrics

Dr. Edward P Davis Philadelphia Modern knowledge on this subject dates from the discovery of the *Spirochaeta pallida* in 1905-1906 as the cause of syphilis The discovery of the Wassermann reaction as a means of diagnosis, and salvarsan in treatment are also important factors Syphilis can be diagnosticated positively in a new-born infant by finding the spirochetes in the blood taken from the umbilical vein and from the tissues about the umbilicus and umbilical cord. Examination of the bodies of infants dying from syphilis soon after birth show the spirochetes abundantly present in the important viscera A woman apparently healthy giving birth to a syphilitic infant is herself syphilitic, although she may show no clinical signs or symptoms for years In these cases syphilis is conveyed from the ovum to the mother through the medium of the placenta The mother is said to have latent syphilis and can nurse her child without disturbance in her own health, and with positive benefit to the child She may, however at any time develop symptoms of secondary or tertiary syphilis The Wassermann reaction is unreliable as a positive test for syphilis in parturient women It may give a positive reaction in cases of severe toxemia and eclampsia when syphilis is absent, and in some other conditions in which the mother's health is seriously disturbed. In the lack of a more reliable means of diagnosis, the Wassermann test should invariably be made in selecting wetnurses and in all suspicious cases

Syphilis in the acute stage attacking a pregnant woman can often be checked promptly by the use of salvarsan While the germs destroying syphilis may be destroyed, the toxins which they produce will usually cause death of the fetus If syphilis occurs early in pregnancy, the best results for the mother and child are procured by mercurial treatment and potassium iodid While skin lesions are present, hypodermic or intravenous injections of mercurial solutions are useful In treating active syphilis in the new-born, salvarsan has been given in the cubital vein with good results When salvarsan is used with the mother and child the urine should be examined repeatedly to determine the presence or absence of arsenic and the presence or absence of signs of irritation of the kidneys Should traces of arsenic disappear from the urine, arsenic poisoning may be feared Syphilis in parturient women greatly increases the mortality and morbidity for the mother on account of mixed infection and lesions of the genital organs Unless promptly detected and treated it is one of the most important causes of fetal death No syphilitic man or woman should be allowed to marry unless he or she has been under observation for six years after the last appearance of symptoms of syphilis.

Syphilis in Relation to Some Social Problems

Dr Sigmund Pollitzer, New York The fact that syphilis can be transmitted from the syphilitic mother to her unborn child was recognized 400 years ago, but the fact that syphilitic children are born of apparently healthy mothers leads to the conclusion that syphilis may be transmitted to the offspring by way of the semen of the father without infecting the mother In fact, paternal syphilis is regarded as the most frequent form in syphilitic heredity More extended and clinical observation, the discovery of the spirochete on the maternal aspect of the placenta, and the results of the Wassermann test have completely changed our views in this respect The transmission of spirochetes to the ovum may be regarded as a physical impossibility, a spirochete is three times as long as the diameter of a spermatozoid head, and, furthermore an infected ovum will not develop into a fetus Colles' and Profeta's laws are true only in the sense that the mother of a syphilitic child and the child of a syphilitic mother already have syphilis, and therefore apparently cannot acquire it The apparently healthy mothers of syphilitic children invariably have a positive Wassermann reaction and generally present symptoms of syphilis if we follow them long enough A Wassermann test should be made in every case of unexplained abortion

A syphilitic man may marry if he has received three years of treatment and has remained free from symptoms for another year or two Millions of happy marriages prove the wisdom of the rule, but the thousands that result in infection of the wives and birth of syphilitic children prove its inadequacy The attempt to control the incidence of syphilis by segregation has proved of slight value, and, moreover, in Anglo-Saxon countries has encountered too much prejudice to permit of its enforcement The control of syphilis must come through education of the public in the risks and dangers of illicit intercourse, and education of the physician in the importance of early diagnosis and proper treatment I cannot refrain from contrasting the generous provision made for the care of the syphilitic in the hospitals of European cities with the attitude of our American hospitals, in most of which the patient with an active syphilis is refused admission

Syphilis of the Internal Genital Organs in the Female

Dr. George Gellhorn and Dr. Hugo Ehrenfest, St. Louis Syphilis is common enough in women to constitute a gynecologic problem in the widest sense Not every disease in a syphilitic woman is syphilitic in nature, but syphilis, if present, will exert an influence of its own on coexisting diseases Latent syphilis prevails more in women than in men The course of syphilis in men differs in many points from that in women To instance but one of the differences the relative frequency of tabes and paresis in the two sexes is well known Primary chancres of the vagina are rare, probably because of certain histologic and biologic characteristics of the vagina Tertiary manifestations of the vagina are also extremely rare They represent, as a rule, the continuation of secondary lesions in the vulva, uterus or adjoining organs The isolated submucous gumma breaks down early and appears in the form of a more or less characteristic ulcer The more destructive processes which eventually lead to the formation of fistulas and strictures almost always originate in structures surrounding the vagina Tertiary lesions of the vagina do not exhibit characteristic symptoms, such as pain or discharge

The primary chancre of the cervix represents the best known and most common type of the syphilitic affections of the female internal genitalia Its frequency has probably been overestimated Statistics based on a large number of observations have never shown a frequency over 1 5 per cent of all primary chancres found on the genitalia Syphilis manifests itself on the cervix in the form of macules, papules and ulcerations These forms probably represent three successive stages in the development of a lesion caused by scattered accumulations of the spirochete in the squamous mucosa of the cervix The parasite can readily be recovered from the secretion of any of the three forms and this explains the great infectiousness of secondary lesions The Wassermann reaction is positive in this stage

Syphilis of the pelvic cellular tissue appears in the form of a diffuse gummatous infiltration which secondarily involves the pelvic peritoneum In almost all instances a diagnosis of malignancy has been made In our case the positive outcome of the Wassermann reaction, together with other unmistakable signs of tertiary syphilis about the outer genitals, aided in arriving at a correct diagnosis Specific treatment produced amazingly quick improvement of an apparently hopeless condition

Occurrence of Syphilis in the University of Michigan Obstetric and Gynecologic Clinic

Dr Reuben Peterson, Ann Arbor, Mich , Out of 2,000 inpatients in the University Hospital, the proportion of syphilitics is 6 per cent The percentage of syphilis in 381 cases in the university maternity was 4 7 In eighteen cases of syphilis among the number examined, only eight, or less than half, gave a history of syphilis In only the same number (eight) were there positive physical signs of syphilis As shown by the histories of the eighteen cases, there was a greater chance for the syphilitic mother treated by salvarsan and mercury to give birth to a living full term child than when no treatment was given during pregnancy The new-born infants of the mothers so treated did not give positive Wassermann reactions, although undoubtedly they were syphilitic and later would probably show signs of the disease A certain proportion of the new-born children of untreated syphilitic mothers will give positive Wassermanns Out of 390 gynecologic patients subjected to the Wassermann test, twenty, or 5 6 per cent gave positive reactions In only five of the twenty-two syphilitic patients was there a history of syphilis

Relationship of Syphilis to Miscarriage and Fetal Abnormalities

Dr F L Adair, Minneapolis Among 1,095 obstetric cases there ewere 2 422 full term pregnancies, 197 abortions 62 miscarriages, 84 premature births, and 8 unclassified cases There were 76 still-births and 16 fetal malformations These cases were studied for evidences of syphilis by the Wassermann reaction, and clinical and necropsy evidence In those cases giving a history of abortion there were 621 pregnancies in 109 cases There were 197 abortions in these cases, or approximately one to every three pregnancies There were 13 syphilitic cases in which there were 74 pregnancies with 23 abortions, or approximately 1 3 In 83 cases without evidence of syphilis there were 464 pregnancies, and 142 abortions, or about 1 to 3 Apparently pregnancy does not end much more frequently during the first three months in those affected with syphilis than in those who are free from the disease Forty patients had 62 miscarriages in 202 pregnancies, or approximately 1 3 Seven patients with syphilis had 10 miscarriages in 27 pregnancies, or about 1 3 Thirty patients without syphilis had 49 miscarriages in 161 pregnancies, or approximately 1 3 There were 68 cases with 84 premature births in 241 pregnancies, or 1 3 There was evidence of syphilis in about one third of these mothers Congenital syphilis appeared in 5 of 50 infants born in the hospital Of the 50 who were stillborn, syphilis was demonstrated in 4 This means that 9 of 50 premature infants were proved syphilitic There were 64 mothers who had 76 stillbirths The Wassermann reaction was positive in about one tenth of these cases Four of 34 infants born in the hospital were proved to be syphilitic, or about 1 8 Two of 15 deformed infants were born to syphilitic mothers There was evidence of syphilis in 2 of 11 cases of hydramnios Two of 5 cases of hemorrhage of the new-born were apparently due to syphilis

How Closely do the Wassermann Reaction and the Placental Histology Agree in the Diagnosis of Syphilis?

Dr J Morris Slemons, New Haven, Conn The Wassermann reaction in the mother's blood and the microscopic examination of the placenta were carried out in 360 consecutive confinements There was absolute agreement between the serologic test and the result of study of the chorionic villi in 345 cases, or 95 per cent Occasionally the placental findings are more reliable than the Wassermann Then, again, the Wassermann may be more accurate than the placenta, and this is most likely to be true in postconceptional syphilis Accurate diagnosis of syphilis in obstetric patients requires both the Wassermann reaction and the study of the placenta The freshly teased chorionic villi should be examined as a routine If their appearance raises suspicion of syphilis, hardened and stained sections of the placenta must be studied and the Wassermann reaction in the mother's blood must be determined Irrespective of the teased villi, both these observations should be made whenever the fetus is premature, macerated or stillborn

Experimental Syphilis

Dr F W Baeslack, Detroit Attempts at immunization by means of *Spirochaeta pallida* vaccines were made and the occurrence of agglutinins in the serum of animals treated with suspensions of dead spirochetes was noted The absence of immunity was demonstrated by the ability to reinoculate animals which had recovered spontaneously or subsequent to treatment An altered reactivity of the body is the possible explanation for the occurrence of the lesions peculiar to the various stages of syphilis

Syphilitic Fever

Dr Frederick J Taussig, St Louis The rare mention of this symptom in gynecologic literature is out of proportion to the comparative frequency of its appearance A positive diagnosis of syphilitic fever can be made only rarely, but the diagnosis can be made with great probability in certain groups of cases Syphilitic fever may be divided into 1 Secondary syphilitic fever occurring at the outbreak of the eruption, lasting usually only three to four days with a rise of temperature of 99 3 or 100 F Fournier estimates that the symptom occurs in 20 per cent of all syphilitics 2 Late secondary syphilitic fever may complicate pregnancy or gynecologic conditions, it is usually prolonged with a higher degree of temperature In these cases the diagnosis is based on the positive history and evidence of a syphilitic infection, the exclusion of other febrile diseases, and the immediate and permanent result of antisyphilitic treatment 3 Tertiary syphilitic fever is of greater diagnostic importance than the two previous groups because the symptoms and history of syphilis are often absent and only the four plus Wassermann points the way to an interpretation of the continuous fever The cause of syphilitic fever is, in all likelihood, to be found in the entrance of spirochete toxins, in addition to the organisms themselves, into the circulation Probably individual predisposition is also an important factor in the rise of temperature That fever occurs occasionally after injections of mercury or salvarsan, when it may be fairly assumed that large quantities of endotoxins are liberated from the dead spirochete, is additional confirmation of the toxic interpretation of syphilitic fever

(To be continued)

Campaign Against Degenerative Diseases of Adult Life— The April number of the *Monthly Bulletin* of the department of health of New York City contains interesting statistics with reference to the mortality from chronic disease of the heart, kidneys and arteries and a careful analysis of their significance by Dr Charles F Bolduan, director of the Bureau of Public Health Education These form the basis for a plan of education for the control of this class of diseases This plan includes the devices that have been employed in campaigns directed against tuberculosis and infant mortality It would also include a large exhibition of adult hygiene on the lines of the exhibition held in Dresden three years ago, the key of the exhibition being prevention, early recognition and competent medical care In connection with this plan the department of health announces that it is prepared to undertake a sanitary survey of any industry, trade or group of manufacturing or mercantile establishments with a view of appraising existing conditions and in order to show employers and workers alike what can be accomplished through a system of voluntary hygienic and sanitary control

9 Action of Temperature and Humidity on Working Power of Muscles and on Sugar of Blood F S Lee and E. L. Scott, New York.

2 **Circulation of Blood at High Altitudes**—The observations recorded in this paper were made on Pike's Peak Briefly, Schneider s study shows that by the first morning spent at the high altitude the pulse rate had accelerated in the group that ascended by train and remained well to from 4 5 to 15 6 per cent., in the mountain sick group to from 22 4 to 46 6 per cent and for those who walked up to from 26 to 66 per cent The mean pulse rate showed the same group differences while the variations throughout the day were the same for each The frequency of the heart beat due to changes in posture was not materially different at the two altitudes The observations on the after effects of walks for fifteen minutes at the rate of three and four miles per hour and of a short rapid run show that physical exertion accelerated the heart rate more at the high than at a low altitude, and that the altitude influence was disproportionately increased as the amount of work was increased For moderate exertion the effects were greater during the first days of residence After a time the three-mile walk did not call forth the altitude acceleration, but it persisted after the four-mile walk even after two weeks of residence The time required for the heart rate to return to normal was also prolonged during the first days but was reduced with acclimatization The short rapid runs were exhausting at the high altitude, the heart was accelerated on an average of 120 beats per minute and the rate remained high for several hours thereafter During work on a stationary bicycle at the high altitude the heart rate increased to the maximum in the primary rise, while at the low altitude the maximum came later, in the secondary rise

Arterial pressures were higher after a given form of work at the high than at the low altitude The influence of lowered barometric pressure was the more pronounced the more vigorous the exertion The reaction was most conspicuous during the first days of residence but while lessened by acclimatization it did not wholly disappear after a residence of two weeks The average rise in the systolic pressure after a short quick run was 61 mm., while the average pressure for each of three men was 177, 195 and 197 mm Hg These high pressures were similar to those caused by a maximum lift of weights The delay in the return to normal was as prolonged as after exhaustive exercises During work the arterial pressures rose more rapidly at the high than at a low altitude the rate of rise was not as rapid as that of the pulse rate. Ordinarily at the low altitude the arterial pressure reaches its maximum before the pulse rate, but at the high altitude the pulse rate first comes to the maximum. Physical work caused in five out of seven subjects a greater rise in the venous pressure at the high than at the low altitude The maximum however, was on the average less than at the low altitude because of the fact that the normal venous pressure was lower on Pike's Peak The exertion of walking up the Peak is exhausting and puts a serious strain on the heart

3 **Effect of Phlorhizin on Digestive Secretions**—The reducing power of the pancreatic, gastric and salivary secretions in normal and phlorhizinized dogs was investigated by Pearce and he found that they do not contain an appreciable amount of reducing substance The pancreatic and gastric juices and sometimes the salivary juice of dogs rendered glycosuric by phlorhizin, contain a reducing substance In the case of the pancreatic juice, this is dextrose

4 **Action of Ultraviolet Radiation on Enzymes, Etc**—According to Faraday's law the amount of silver deposited on the cathode, when an electric current is passed through a solution of silver salt, is proportional to the amount of current passed that is, to the energy applied It has been shown that this same relation exists between the amount of current passed and the destruction of enzymes In view of these facts it would seem that the relation between the decrease in enzyme activity and exposure to ultraviolet radiation should be linear The experiments reported by Burge, Fischer and Neill were carried out to see if this was true They tested epinephrin secretion and cholagogues, trypsin, trypsinogen pepsin, ptyalin, amylopsin and enterokinase The rate of destruction was found to be proportional to the amount of energy applied, except that the cholagogic activity of bile was not affected by exposure to ultraviolet radiation

6 **Innervation of Kidney**—The experiments cited by Burton-Opitz confirm his previous contention that the innervation of the kidneys is unilateral and enable him to explain the peculiar changes in the blood supply of these organs which he obtained on contralateral stimulation of the splanchnic nerves The initial increase in the flow is attributed correctly to the rise in the general blood pressure, because as the kidney on the opposite side is not directly affected by the stimulation, its vascularity must be subject to the changes in the arterial driving force The subsequent decrease in the blood supply is caused by the secondary constriction of the renal blood vessels by the epinephrin

8 **Chemical Properties of Certain Mammalian Muscles**—This paper contains the results of a determination of the chemical elements other than carbon, hydrogen and oxygen and of the glycogen occurring in four muscles of the cat, namely the diaphragm the extensor longus digitorum, the sartorius and the soleus, together with an endeavor to correlate those results with certain of the physiologic properties of the same muscles The authors found that the quantity of lipin sulphur and of water-soluble sulphur is least in the diaphragm, greatest in the soleus, and intermediate in the extensor and the sartorius, that is, the quantity of nonprotein sulphur varies inversely to the order in which most of the general physiologic properties of the muscles are expressed The ratios betwen the lipin sulphur and the lipin phosphorus and between the water-soluble sulphur and the water-soluble phosphorus vary directly as most of the general physiologic properties of the muscles The protein sulphur varies directly as most of the general physiologic properties of the muscles, and is possibly to be correlated with muscular respiration The glycogen content is greatest in the diaphragm, least in the soleus, and intermediate in the extensor and the sartorius It thus varies directly as most of the general physiologic properties of the muscles and is to be especially correlated with their reducing power and their working power For each muscle there seems to be a specific ratio between the potassium and the sodium

May XXVII, No 303, pp 121 156

15 *Nitrogen Metabolism During Pregnancy K. M Wilson, Baltimore
16 *Functional Significance of Mitochondria in Toxic Thyroid Adenomas E Goetsch, Baltimore
17 *Renal Diabetes, Report of Case D S Lewis and H O Mosenthal, Baltimore
18 Bilateral and Complete Trigeminal Paralysis Without Involvement of Other Cranial Nerves C M Byrnes, Baltimore.
19 Digestion, Historical Survey R J Cary, Lake View, Wash

15 **Nitrogen Metabolism During Pregnancy**—Observations were made by Wilson on the nitrogen metabolism in three normal pregnancies, in one patient for a period of four weeks, from the tenth to the fourteenth weeks of the pregnancy The other two patients were studied for the last 133 and 101 days of their respective pregnancies and also for a short time in the puerperal period A fairly liberal diet was allowed, both in quantity and character of foodstuffs used The urine was collected for twenty-four hour periods, and carefully preserved, of these specimens daily analyses were made The feces were preserved and analyzed weekly Wilson found that in the perfectly normal pregnant woman, storage of nitrogen begins at a much earlier period than has hitherto been supposed, possibly the organism may acquire the capacity for storing nitrogen from the very beginning of the pregnancy In the early months this storage is far in excess of the actual needs of the developing ovum, and the excess must be added to the general maternal organism Storage of nitrogen continues throughout the entire duration of pregnancy, being most marked during the last few weeks, when the fetal needs are at a maximum The nitrogen stored is greatly in excess of the actual needs of the developing ovum, so that, apart from the amount needed for the hypertrophy and development of the genitalia and breasts, a large proportion of the nitrogen stored is added to the general maternal organism as "rest material," though, concerning the form in which the reserve is stored, the author is unable to make any positive statement The nitrogen capital of the maternal organism is thus increased, though the reserve supply may possibly be entirely exhausted during the puerperium and period of lactation

In the healthy woman, who goes through a normal pregnancy, the period of gestation does not necessarily represent a "sacrifice of the individual for the sake of the species," but may actually be a period of gain There is a relative increase in the percentage of urinary nitrogen excreted in the form of free amino-acids, though not necessarily an absolute increase in this form of nitrogen There is also a tendency for the precentage of ammonia nitrogen to become increased during the last weeks of pregnancy, although at other times during the pregnancy there is practically no variation from the percentages noted in nonpregnant individuals on a similar diet

16 **Significance of Mitochondria in Toxic Thyroid Adenomas**—Attention is directed by Goetsch to the determination of glandular function, especially in a gland presenting so many variations in its pathologic anatomy as the thyroid gland He feels that in the study of the pathologic anatomy of the thyroid gland, the mitochondria will prove to be a better index of the thyroid activity than the histologic criteria heretofore applied Since the mitochondria occur normally in the thyroid cell, and since they are present in greatly increased numbers in the adenomas associated with symptoms of hyperthyroidism, it would seem probable that they are correlated with an overproduction of an otherwise normal secretion produced by the thyroid cell It is interesting that exophthalmos is so rarely, if ever, associated with thyroid adenomas Goetsch suggests that perhaps there is a very different form of intoxication in the true Basedow's disease In the latter the thyroid gland, just as in the case of the toxic adenomas, shows a marked increase in mitochondria over the normal There are, however, several differences in these two conditions in the number, morphology, size and distribution of the mitochondria, a description of which is promised in a later report

17 **Renal Diabetes**—The patient whose case is cited by Lewis and Mosenthal showed glycosuria, but none of the other abnormalities characteristic of an impaired carbohydrate metabolism A slightly diminished phenolsulphonephthalein excretion, the slight elevation of Ambard's constant above the normal, as well as the glycosuria, point to a depressed kidney function The absence of any further subjective or objective signs, past or present, leads the authors to the conclusion that a renal glycosuria is an interesting anomaly, but of no importance to the organism as a whole

24 Osteo Arthritis H W Wilcox, Denver
25 Mortality in Abdominal Surgery E C Rich, Ogden, Utah
26 Effects of Drying on Viability of Germs J M Shapiro, Denver

23 **Rest of Lung by Posture**—The authors suggest to attempt to train tuberculosis patients to rest at night and during day time on the more afflicted side, and in addition to place a small firm pillow under this side to restrain to a greater degree its motion The application of the principle suggested would seem to have been efficacious in many patients for a year past in reducing the amount of sputum promoting healing, hindering relapses and diminishing fever

47 *Bile Compared With Lactose Bouillon for Determining Presence of B Coli in Water M M Obst, Washington, D C

46 ***Stock Cultures of Meningococcus***—*The culture medium devised by Roos is a modification of the potato blood agar used by Bordet and Gengou for the isolation of B pertussis It permits of relatively slow growth of the meningococcus with apparent suppression of ferment formation, thus resulting in greater viability Preparation of medium 1 Prepare potato extract as follows (a) Potato peeled, cut in small pieces and washed in running water for about two hours, 100 gm (b) Water containing 4 per cent double distilled glycerin free from acid, 200 c c (c) Mix and autoclave for forty minutes (d) Allow to stand over night and strain through cheese cloth 2 Make potato extract agar as follows (a) Mix in an Erlenmeyer flask, potato extract, 50 c c ,*

sodium chlorid solution 0 65 per cent, 150 c c, agar 5 gm (b) Heat in Arnold sterilizer until agar is melted, requiring from thirty minutes to one hour 3 Tube without filtering, and sterilize, in autoclave for about forty minutes 4 When wanted for use, melt the agar, cool to about 45 C and add the desired amount of sterile defibrinated horse blood. The amount of blood to be added depends on whether or not the meningococcus has become accustomed to the medium

47 **Bile Compared with Lactose Bouillon**—Lactose bouillon used by Obst as a substitute for lactose peptone ox-bile permitted the development of about twice as many *B coli* from water as the bile medium Lactose bouillon costs less in money and labor The difficulty of obtaining pure, fresh bile puts it almost out of the reach of many workers The stored bile is proved to show progressive deterioration Lactose bouillon can be prepared when desired and can be made more uniform It need contain no precipitate to clog the inner tube or to affect the activity of the organism

64 Limit of Assimilation of Glucose. A. E. Taylor and F Hulton Philadelphia.

48 **Amino-Acid Minimum for Growth**—Additional experiments are reported by Osborne and Mendel to show the part played by tryptophan and lysin in the metabolism of maintenance and growth The quantity of these amino-acids available in the diet can be made the limiting factors which determine the nutritive equilibrium and possibilities for increment of size in an individual. They afford an important illustration of the "law of minimum' applied to essential nitrogenous components of the food supply

49, **Excretion of Uric Acid After Ingestion of Sodium Benzoate**—Coincident with the maximal elimination of the ingested benzoate during the first four hours after administration, the uric acid excretion was markedly diminished, a decrease of 50 to 70 per cent. as compared with the excretion during the corresponding periods of the fore and after days No significant changes in the elimination of creatinin or uric acid resulted from the administration of large doses of sodium hippurate The decreased uric acid excretion observed after benzoate ingestion would seem to be due to the effect of the benzoic acid itself and not to its conjugated, nontoxic derivative hippuric acid There was a slower elimination of the hippuric acid after the administration of sodium hippurate, than after benzoate administration.

59 **Dietary Deficiencies of Wheat Embryo**—The experiments reported in this paper reveal the fact that the wheat embryo contains qualitatively all the factors essential for the promotion of growth and well-being in an animal, but these are not so proportioned that it can serve as a satisfactory diet without several modifications The mineral content must be modified in certain respects before growth can proceed at all The character of the proteins is excellent, no other proteins from plant sources which the authors have studied are superior to them Rations containing but 10 per cent of these proteins are wholly adequate for growth at the maximum rate Both the fat soluble A and the water soluble B, the factors which must be supplied by an adequate diet, but whose chemical natures are as yet unknown, are present, the first in moderate concentration, the second, in very high concentration as measured by the needs of the growing animal Two per cent. of wheat embryo supplies enough of the water soluble B to promote growth at the normal rate for several months There is contained in the wheat germ a substance which is distinctly toxic to animals This is in great measure removed by extraction with ether, and is found in the fat fraction The authors have not yet determined whether the toxicity is due to peculiarities in the chemical nature of the fats themselves or to something which is associated with the fats

60 **Hydrocyanic Acid in Plant Tissues**—Alsberg and Black show that the leaves of *Prunus virginiana* must be distilled with acid four hours before all of the hydrocyanic acid is liberated whereas in Andropogon and Panicularia less than one hour is sufficient to liberate all hydrocyanic acid present It is further shown that in macerating plant tissues that contain hydrocyanic acid a certain amount of the hydrocyanic acid present or of cyanid that may be added is so converted that it is not recoverable by distillation with sulphuric acid This is not due to the action of enzymes or to the presence of glucose It is here shown that in determining hydrocyanic acid in plants several methods in corroboration of each other must be used

62 **Effect of Surgical Procedures on Blood Sugar Content.**—Seventy-seven cases were studied by Epstein and Aschner In twelve cases in which they observed a hyperglycemia before anesthesia (a sugar content above 0 11 per cent) it was evident from further examinations that the high sugar content was due to various associated factors, and not to any psychic disturbances These were of the nature of obesity nephritis, hypertension, fever and loss of blood as in menorrhagic conditions, in which a hyperglycemia is believed to be encountered frequently That the hyperglycemia in these cases was due not to psychic factors was further evidenced by the subsequent determination of the blood of these patients, which showed that the hyperglycemia was persistent in many of them Only four patients operated on under local anesthesia were examined, and from the results obtained it appears that not only was there no resultant hyperglycemia, but that a slight diminution in the blood sugar content takes place Sixty patients operated on under general anesthesia were examined In fifty-seven of the sixty cases there was a well marked increase in the blood sugar content after anesthesia and operation In one case there was a rise of only 0 001 per cent within the limit of error In another case there was a decrease of 0 004 per cent. in a third a decrease of 0 006 per cent The average results in all kinds of cases, regardless of duration, showed a decided increase after operation, and the persistence of a moderate increase twenty-four hours later There was no difference between the effect of intraperitoneal operations and extraperitoneal operations on the sugar content of the blood The anesthesia played the important role in the production of the hyperglycemia observed The more marked increases in blood sugar content appeared when the anesthesia lasted one hour or more. The operation of nephrectomy had an especially marked effect in the blood sugar content and the operation of itself was responsible for a good part of the

hyperglycemia, over and above the effect of the prolonged anesthesia Postoperative glycosuria was found in only one of fifty cases in which the postoperative urine was examined for sugar with Fehling's reagent This was a plastic operation lasting fifty-five minutes

105 **Auricular Flutter.**—A classification by Tallman of fifty-eight cases demonstrates three different types (1) flutter in an apparently normal heart, (2) auricular flutter supervening during the course of chronic heart disease, (3) auricular flutter with partial and complete heart block The study of the radial pulse demonstrated that the rate and rhythm varies greatly in the different cases and at different times in the same case When the pulse is responding at from 130 to 160 beats per minute, a 2 1 rhythm is present which is usually regular and presents many alternations In only five cases were the polygraphic characteristics of auricular flutter definite and in accord with the clinical findings The duration of flutter, Tallman says, has apparently but little effect on the results of medication With the slowing of the ventricular rate the objective and subjective symptoms of flutter rapidly disappear In his experience digitalis must be given in large doses, frequently increasing the dose to the point of physiologic tolerance In cases of partial block, he says, it is well to proceed carefully and slowly, as in these cases life and comfort depend on the long continued use of this remedy In many cases of auricular flutter there is a tendency to recurrence which responds to treatment equally as well as the first attack When normal rhythm cannot be secured, sufficient digitalis should be taken to reduce the pulse rate to from 60 to 70 beats per minute In cases of extreme urgency strophanthin intravenously has given marvelous results in his cases

132 **Quinin and Urea Injections in Hyperthyroidism**—Watson has used quinin and urea injections for hyperthyroidism over 400 times He believes the greatest field of usefulness for the injection will be found in those cases of beginning hyperthyroidism not severe enough to justify operative treatment and as a preparatory measure to partial thyroidectomy in chronic cases of toxic goiter too ill to warrant any form of immediate operative procedure

139 **Sodium Citrate in Transfusion of Blood**—Carter has found sodium citrate to be a satisfactory anticoagulant when used in the cylinder for direct transfusion in 2 per cent solution. Transfusion can be continued from 2.5 to 3 times longer with a 2 per cent citrate solution than can be done with physiologic solution A solution of sodium citrate is as efficient as a solution of hirudin as shown by the amount of blood transfused or by the time of transfusion Sodium citrate does not lessen the coagulability of the blood and is not toxic in the amount used either for direct or indirect transfusion. The coagulability of the blood is temporarily increased immediately after transfusion in which sodium citrate is used, either by the direct or indirect methods The lethal dose of sodium citrate in dogs is about 1 0 gm per kilogram of body weight when dilute solutions are injected Even when a concentrated solution is used it is not more than 0.5 gm per kilogram A 0.2 or 0.3 per cent solution of sodium citrate is sufficient to prevent coagulation and does not have any toxic effect in the amount used for indirect transfusion in man

140 **Reliable Method of Blood Transfusion.**—A glass graduated flask or container, open at the top with the bottom drawn out into two arms, or in a 'U' shape, is used by Singleton The two ends of the 'U' are inserted into the donor's and recipient s veins respectively A rubber connecting tube leads from the top of the container to the pressure bottles These bottles give a more uniform pressure, exerted continuously over a longer period of time, and the pressure can be changed from positive to negative, and vice versa more rapidly

142 **Arsenobenzol.**—The effects obtained by Thompson with this preparation he says, were as good as those obtained with salvarsan of German make

7 New Apparatus for Bacterial Fermentation Tests Fermentation Bulbs S Delepine.

1 **Ankylosis After Gunshot Injuries of Joints**—Wounds must inevitably end in bony ankylosis In what position should the joint be placed in order to be of the greatest use to the patient? This question is answered by Jones as follows The arm should be abducted to about 50 degrees The elbow should be slightly in front of the coronal plane of the body so that when it is at right angles and the forearm supinated the palm of the hand is toward the face As for the elbow joint, by far the greater number of men would prefer the fixation to be at just below a right angle—that is about 100 degrees In cases in which both elbows will become ankylosed it is necessary to fix the one at an angle of 80 degrees and the other at 100 degrees In the forearm, if the movements of pronation and supination are lost, the radius should be fixed midway between pronation and supination All injuries of the wrist joint should be treated with the wrist dorsiflexed This is a priceless surgical axiom, the neglect of which is grave Ankylosis of the hip joint should be encouraged in a position of very slight abduction, with thigh extended and very slight outward rotation The knee should be fixed in an extended position In ankylosis of the ankle the foot should be kept at a right angle with the leg so that the sole impinges on the ground in a slightly varus rather than a valgus position In gunshot wounds and other injuries of the tarsus and metatarsus, the deformities to be feared correspond to the common static deformity of flat or pronated foot—that is to say, to pronation at the mid-tarsal joint flattening of the longitudinal arch, and sometimes flattening of the transverse arch associated with pain in the metatarsophalangeal joints Callus exudation added to plantar malposition results in a very crippled foot. In all gunshot injuries of tarsus and metatarsus the surgeon should take care during the later stage of healing not to bandage the sole rigidly against a flat foot piece, for if that be done every irregularity of bone will conduce to callosity when walking is resumed It is necessary, therefore, at this stage to adjust a splint having an inside arch padded to conform to the natural shape of the foot Eversion of the foot should be guarded against, and the hollow of the arch should, when possible be emphasized Later, the heel of the boot should be raised on the inner side to obviate eversion, and, if the metatarsals are involved, in order to allow of early walking, a bar should be placed across the sole of the boot behind the tread

2 **Preparation of Nontoxic Dysentery Vaccine**—The results of their experiments on forty-seven rabbits have convinced Dean and Adamson that it is possible by the use of dilute solutions of hypochlorous acid to prepare a Shiga vaccine the injection of which is practically harmless to the rabbit but is nevertheless followed by the production of a satisfactory degree of immunity

12 Flies in Jail. T S Ross
13 Case of Sarcoma of Dura Mater S B Pal.

9 **Dressing Eyes After Cataract Extraction**—In order to produce an even pressure over the front of the eyeball Maynard uses swabs of wet sterilized wool applied as follows Wool pulled not cut, into pads about an inch thick and the size of the dry wool pads usually used 3 inches in diameter, are sterilized by boiling in 1 in 5,000 biniodid solution After the completion of the operation two of these sopping wet not squeezed out, are laid on the two eyes With the straightened fingers they are gently pressed down over the eyes, so that the swab becomes molded to the eye and fill in the hollows round it Over this swab is placed a wet pad consisting of lint or six layers of gauze and then a figure of eight bandage is applied fairly firmly On opening the dressing next day the wool gauze will be found dry

and forming a complete mold of the eyeball and orbital opening This wet molding method is very comfortable and produces no feeling of uneven pressure while it allows the eye to move easily It is almost impossible to open the eyelids

26 Case of Marked Postdiphtheritic Paralysis W A Daley and C V McCormack
27 Case of Os Tibiale Externum Simulating Fracture of Navicular Bone C P G Wakeley

24 **Significance of Presystolic Heart Murmurs**—It is most important from an insurance company's point of view, says Lumsden, that these cases should be carefully differentiated, but when the examiner is in any doubt it is wiser to treat all presystolic murmurs as serious than to risk accepting even at an increased premium patients suffering from so serious a condition as either mitral stenosis or aortic regurgitation Even when after most careful examination it is ascertained that it is a case of "astenotic" presystolic murmur Lumsden recommends that several years should be added to the age of the patient when calculating the premium he ought to pay, since many of these cases have slightly abnormal mitral valves which are more apt to become incompetent than a normal valve The number of years to be added must depend on the particular case, but should never be less than five "Astenotic" cases can, however, be accepted for any ordinary occupations and even for posts of such importance as tramdrivers, chauffeurs, etc, since fainting is never a symptom of this condition per se The existence of this murmur is not a bar to military service, nor to any form of sport or exercise The murmurs discussed by Lumsden are (*a*) Flint's murmur, (*b*) stenotic presystolic murmur, (*c*) astenotic presystolic murmur, (*d*) normal heart, (*e*) stenotic presystolic and systolic murmurs The sound, he says, may be imitated by pronouncing, (*a*) Flint's frrip, dupfrrrip, dupfrrrip, (*b*) stenotic frrrip, dupup, frrrip, dupup, (*c*) astenotic frrip, dup, frrrip, dup, (*d*) normal lub dup, lub dup, (*c*) stenotic and systolic frrripwhist dup, frrripwhist dup

25 **Typhoid Carrier**—The carrier whose case is discussed by Dudley was a sailor His service on various ships was marked by the appearance of typhoid He served on twelve ships on which fifty-three cases occurred subsequent to his enlistment The following observations were made on this carrier while in the hospital The urine was always sterile Blood cultures were negative The Widal reaction was positive up to a 1 150 dilution, it varied very slightly in strength The appearance of typhoid bacilli in the stools was intermittent, three or four examinations being negative, followed by two or three positive results In seventeen examinations of the feces at intervals of about three days *B typhosus* was isolated seven times

35 Neuroses and Psychoses in War A W Campbell
36 Bacteriologic Examination of Urines L B Bull

29 **Meningococcal Carriers**—Forty-three civilian cases were fully investigated by Champtaloup and Bowie of which five (or 11 6 per cent) were found to harbor the meningococcus in the nasopharynx One individual developed meningococcal meningitis and died Thirteen persons of the forty-three investigated had been in recent close contact with troopers on leave, and the bacteriologic finding was positive in three cases Several of these contacts had been using antiseptic gargles and douches, however, before being examined The remaining thirty had not to their knowledge been in contact with soldiers, and of these only two yielded positive results Four of the civilian patients subsequently died One developed meningococcal meningitis, a second, from whose nasopharynx a profuse growth of meningococci was obtained, developed a fatal streptococcal septicemia, a third, in whose nasopharynx no meningococci were found, developed acute hydrocephalus with no postmortem evidence of bacterial infection, and a fourth, also negative, developed tubercular meningitis These fatal cases bear out the importance of a bacteriologic examination of all suspicious cases during an epidemic, otherwise they might have been returned as fatal cases of meningococcal infection

49 Surgical Disabilities of Troops in Training F J Cutler

37 **Surgical Treatment in Gunshot Fractures of Mandible**—Although he has used wire successfully in a number of cases, Eve considers transplantation of bone the ideal method for bridging over gaps in the mandible He has not yet seen a case in which plating of a gunshot fracture of the mandible seemed advisable He points out that in the earlier stage of the treatment of severe comminuted fractures of the mandible, special care should be taken to preserve fragments of bone which may be viable If they necrose, removal may be effected later, and, meanwhile, they may prevent displacement while new bone is being thrown out

54 Oculomotor Paralysis After Paratyphoid Fever G Guillain and J A. Barre

52 **Pseudo-Typhoid**—Bernard says that it is often difficult to distinguish between mild typhoid and febrile gastric derangement and yet they must be differentiated as the latter may reproduce the incomplete form of typhoid while in reality having no connection with typhoid The colon bacillus is generally the one responsible for it

53 **Typhoid After Vaccination**—Rist comments on the fact that the number of typhoidal affections has apparently not diminished in the last year The total number of cases averages about the same as before but the cases of true typhoid are far below the usual number and paratyphoid cases have taken their place Not much is gained, he remarks if we merely substitute paratyphoid for true typhoid This reduces the mortality of course but the morbidity has not been modified according to his s atistics Vaccination must ward off both typhoid and paratyphoid to accomplish its purpose

59 *Modifications of Pulse and Blood Pressure During Menstrual Period (Des modifications du pouls et de la tension arterielle pendant la periode menstruelle.) P Balard and J Sidaine.

58 **Ovarian Cysts Following Mole**—Bar remarks that a cyst developing in the corpus luteum after evacuation of a hydatidiform mole is of too frequent occurrence to be merely a casual coincidence Kroemer found them in 59 per cent of the cases of mole he had compiled Bar has encountered a similar case The patient was a young woman who had had a hydatidiform mole removed three months before The adnexa seemed to be normal at that time but three months later both ovaries were found transformed into masses of cysts with hyperplasia of the corpus luteum tissue A small mass of molar vesicles was also found in the uterus This case and similar ones on record teach the necessity for removing the uterus and adnexa in operating for a mole when there is the least suspicion of cyst formation in the ovaries Also that after removal of a mole from the uterus if the ovaries display a tendency to cystic degeneration we can assume that elements of the mole are still proliferating in the interior of the uterus The significance of ovarian cysts in these circumstances is still more pressing when there is a tendency to persisting uterine hemorrhage Prompt operative measures are required, including the removal of the uterus

59 **Modifications in Pulse and Blood Pressure During Menstrual Period**—Balard and Sidaine review the literature on this subject and give charts of the findings during a three months period in five young and healthy pupils in the midwifery school The pulse showed decided variations in all but one of the young women, and the blood pressure varied in all but not to such an extent as the pulse There did not seem to be any regular rules for all cases or even for one person at all times, except that the pulse increased just before the onset of the menses and dropped back to normal or transiently below at the close The charts demonstrate anew the complexity of physiologic phenomena

68 *Rapid Healing of Abscesses in the Neck Without Scars Under Filiform Drainage (Guerison rapide et sans cicatrices des adenites et des abcès aigus et chroniques du cou) H Chaput.
69 Apparatus for Early Exercise of Wounded Leg in Bed Amieux

68 **Healing of Abscesses in the Neck Without Scars**—Chaput refers to suppurating glands and abscesses in the neck of tuberculous or other origin A small superficial abscess he pierces with a needle drawing back with it two strands of silkworm gut which he knots to form a loop, repeating the process perpendicular to the first and thus providing crucial drainage A deep abscess he lances at the tip and through this minute incision he probes the depths and recesses then with a Reverdin needle introduced through the incision he pierces the skin from within at the poles of the abscess and the diverticula Silkworm gut is drawn back with the needle and he ties the ends together at the central incision This provides radiating drainage A single drain may suffice if at the absolutely lowest point A fine rubber bougie or spiral wire may answer likewise for the filiform drainage With active suppuration induration is liable to follow evacuation of the abscess if the patient is up and about Hence it is better to leave the drains in place until all induration has subsided keeping the patient in bed or at least confined to the room Chaput says that filiform drainage is nothing new but it has never been applied as generally as he advocates, and its advantages have not been appreciated

Presse Médicale, Paris

April 20 XXIV No 25 pp 177 184

70 Prophylaxis of Malaria (La prophylaxie du paludisme.) H Vincent
71 *Causalgia and Its Treatment. (De la causalgie envisagee comme une nevrite du sympathique et de son traitement) R. Leriche

71 **Burning Neuralgic Pain Causalgia**—Leriche states that this burning type of neuralgic pain has certain features which suggest that it is the result of irritation at some point of the sympathetic innervation of the limb involv The war has rendered this causalgia comparatively cc

and has confirmed the assumption that it is a neuritis of some part of the sympathetic system The most convincing argument in favor of this assumption is the success of therapeutic measures based thereon, aiming to modify the peripheral sympathetic Leriche acted on the sympathetic by stripping the peripheral arteries, supplementing this denudation by severing the perivascular nerves and, when possible, removing the entire sheath of the vessel over a certain extent In one case of agonizing causalgia from a gunshot wound, he denuded the humeral artery and excised its sheath for a stretch of 12 cm Improvement followed at once The pains were materially reduced, the vasomotor phenomena subsided and the relief has been permanent during the six months to date In a second case there was complete lax paralysis of the left arm after a gunshot wound with fracture of the clavicle The arm was constantly cold and various trophic disturbances developed, with paroxysms of burning pain in the hand The causalgia by the sixth month was most distressing, and Leriche then exposed the humeral artery There was no pulse or blood in it, and it was reduced to a cord scarcely 2 or 3 mm in diameter The neighboring nerves were soft He removed the arterial sheath for quite a distance, there was no hemorrhage The next day there was formication in the hand and it felt warmer The trophic blisters and other disturbances retrogressed, and in a fortnight the man could move his arm a little The pains had been materially mitigated from the first The resection of the arterial sheath modifies the perverted sympathetic innervation by acting on the peri-arterial nerve plexuses involved The mechanism and effect are similar to those of section of the cervical sympathetic in treatment of trigeminal neuralgia suppression of certain diseased elements of the sympathetic innervation restores freedom of action to the other vasomotor ramifications In both his cases the clammy, livid hand grew warm and normally pink, showing that the upset vasomotor balance had been restored

For the leg he would attack the sciatic or femoral artery, as these nourish the sciatic nerve from the rear and front He has had no occasion to operate on the legs, but is convinced that this simple method of acting on the peri-arterial sympathetic innervation will relieve in many cases of sympathetic neuritis causing painful vasomotor troubles, especially after wounds of the hand and forearm in which the trunk nerves themselves are free from all injury Possibly the procedure may benefit also in certain cases of reflex contracture and paralysis suggesting a vasomotor element In short, he concludes, it is a new field to explore, and a promising one

73 **Cancer of the Rectum**—In a typical case described the robust and vigorous man of 51 complained merely of "internal hemorrhoids," saying they had been troubling him for two years His former physicians had treated him for constipation and congestion, but none had palpated the interior of the rectum Potherat placed the man on his side, the thigh and leg completely extended while the upper thigh and leg were flexed He then anointed the region and his rubber glove, and his finger found at once a large ulceration in the rectal mucosa, adherent to the prostate He discusses the advisable technic in such cases and says that with a palliative artificial anus at the sigmoid flexure or descending colon one such patient survived in good condition for four years, another for thirteen months, taking walks of 16 kilometers a day Potherat deplores that so few physicians make a routine practice of digital examination of the rectum, and thus cancerous growths reach an inoperable stage before they are suspected

74 **Tuberculous Rheumatism**—Rathery describes two cases of chronic rheumatism to illustrate one form and suggest its explanation One woman of 32 at 18 had rheumatic trouble in the right hand for two months, and two years later in the right knee, and no further disturbance for twelve years Then chronic bronchitis developed, with rheumatic pains in her fingers, and the joints swelled, with stiffness of the wrist and, finally, hydrarthrosis of the right knee Radiography confirmed the deformity of the joints, but the process is not so extreme as with other forms of rheumatism There are also signs of an apical process A second case, in a man of 38, is practically identical Rathery's explanation of such cases is that the early rheumatic phenomena were due to an arthritic soil With this, chronic rheumatism develops on the occasion of any ordinary or specific infection or intoxication In these cases tuberculosis was responsible

76 **Typhoid Orchitis**—The orchitis and epididymitis developed during convalescence from typhoid and left limited induration The course was about six days Others have reported three cases in the recent epidemic of typhoid The affection was unilateral in all, but the cord was involved in three of the cases and the vaginalis in two There was suppuration in two cases and a relapse in another case None of the patients had gonorrhea Typhoid bacilli were cultivated from the process in two cases, the colon bacillus in one, and the paratyphoid B in one This typhoid complication resembles the orchitis of mumps by its rapid course, and the orchitis of gonorrhea by the involvement of the cord and epididymis, while the tendency to suppuration is peculiar to it

78 *Miliary Tuberculosis With Chronic Benign Course (Ueber Miliar tuberkulose) L. von Muralt
79 *Iodin in Treatment of Goiter (Zur Joddarreichung bei Kropf) Grumme.

78 **Benign Miliary Tuberculosis.**—Muralt describes a case which shows the possibility of miliary tuberculosis developing in a mild chronic form with ultimate recovery The patient was a physician of 35 with an inherited neuropathic and tuberculous taint, but healthy, except for "children's diseases" and pleurisy at 22, until the age of 31 when, after several months of overwork as physician at a tuberculosis dispensary, with inadequate food, pleurisy with effusion developed insidiously and kept up for fifteen months without impairing the general health particularly Then miliary tuberculosis developed with a stormy onset but soon subsided to such a mild course that the contrast between the Roentgen findings and the good general health was striking The Roentgen picture was highly characteristic within three weeks of the first miliary onset After two years of this, two tuberculous tumors in the scrotum required excision in turn and later tumors of the same kind developed in the spinal cord and medulla, one finally proving fatal after two had been removed Miliary tuberculosis seems to be accompanied by tumors in the central nervous system comparatively often Muralt has encountered a second case which demonstrates this anew A young woman with acute miliary tuberculosis and night sweats presented symptoms of a tumor in the brain On account of the septic condition no attempt at operation was ventured and death followed in less than a year from the first symptoms of the miliary tuberculosis In the first case there were no night sweats at any time, and after the initial phenomena the disease subsided into an entirely latent course and death occurred eight months later, from the tumors, with no further signs from the miliary disease

79 **Iodin Treatment of Goiter**—Grumme insists that endemic goiter is due to a lack of iodin in the food, and hence that administration of iodin benefits endemic goiter He regards it as probable that if Switzerland would promote

the importation of sea fish, so that they would be plentiful and cheap goiter would become less prevalent More than two thousand years ago the Greeks recommended sponge charcoal (*Schwammkohle*) for goiter, which was an iodin treatment, and experience has confirmed the value of iodin in prevention and cure of endemic goiter Regions where goiter is endemic are usually free from the exophthalmic form in which iodin does harm Even the eating of sea fish aggravates Basedow's disease, as Grumme has confirmed in his own practice It is important therefore, to exclude any tendency to the Basedow type before permitting iodin A tranquil temperament a phlegmatic disposition usually exclude exophthalmic goiter The endemic mountain-goiter is generally inclined to be hard and sometimes knobby while the Basedow goiter is soft He warns in conclusion that the administration of iodin requires great care not only for those with goiter but in general practice as there may be a latent predisposition to Basedow s disease which iodin may fan into a flame Oswald regards this danger as so serious that he advises against iodin for any form of goiter

86 Ligation of Coronary Arteries and Veins. L. Dominici To be continued

85 **Extensive Pedunculated Flaps for Autoplastic Operations.**—Cignozzi extols the advantages of the Italian method for autoplastics describing an illustrative case In an industrial accident the skin and muscle had been torn from the elbow and adjacent regions over an expanse 15 by 25 cm. in size This was covered with a flap cut in the side of the chest and abdomen, the upper end not cut across the arm fastened immovably to prevent any traction on the flap In one week the flap was cut partly across and the twelfth day was completely severed By the twenty-fifth day the flap had grown entirely in place and by the fiftieth day healing was complete, the functioning of the elbow normal.

87 **Diabetes of Nervous Origin.**—Silvestri reports the clinical course and necropsy findings in a case of diabetes in which there were no pathologic anatomic findings capable of explaining the diabetes He assumes that it was of nervous origin, as the neurasthenic man of 53 had a family history of much nervous and mental disease. The literature on the subject of diabetes developing after disastrous speculation or other nervous shock is reviewed, and authors cited for and against the assumption that diabetes can be brought on by nervous factors alone Silvestri's four other cases also apparently confirm this beyond question One patient was a neurasthenic man with inherited psychopathic taint whose urine was found to contain sugar after a period of much worry The urine after a medical examination always contained sugar In the course of a few years the neurasthenia subsided and the urine became normal At present there is no further trace of the neurogenous "diabetes' of eight years before although no attempt at dietetic treatment had been made Another patient was a woman with a family history of diabetes After an attack of pneumonia she had mild glycosuria which yielded promptly to restriction of carbohydrates until her son developed typical diabetes which ran its course to a fatal ending in three years After this the mother's glycosuria became permanent unmodified by dietetic measures In the two other cases the glycosuria came on directly after a severe grief or fright These experiences testify that diabetes may occur for the first time or be roused or aggravated by nervous shocks and Silvestri explains the probable mechanism by which this is brought about He has been unable to trace it to any one gland or other organ, but the *influence of a hereditary taint is obvious*

106 *The Residual Nitrogen in the Blood as Index of Kidney Efficiency (Den kliniske Undersøgelse af Nyrefunktionen særlig ved Bestemmelse af Rest Kvælstoffet) V Scheel Commenced in No 14
107 Venereal Diseases at Copenhagen (Kønssygdommene i København for og efter 1906) S Lomholt

105 **Simple Test for Albumin in the Urine**—Andresen has been giving E Lenk's method a thorough trial (It was described in these columns Jan 1, 1916, p 66) He found it even more dependable than other technics if temperature, interval, etc, are uniform

106 **Residual Nitrogen in the Blood as Index of Kidney Efficiency**—Scheel's extensive research on the retention of "rest nitrogen" in the blood as an index of renal function has convinced him that determination of the residual nitrogen is as necessary a routine measure and even more important than to examine the urine for albumin It differentiates nephritis from various conditions with hypertrophy of the heart and high blood pressure, which are so frequently mistaken for nephritis It serves further as a guide to treatment, and throws light on the prognosis It is important particularly because it shows to which of our patients with nephritis we can permit protein feeding freely and which must have their protein cut down In his discussion of the various other tests of kidney function, he remarks that tests with substances alien to the body are never entirely satisfactory Also that the functioning of an organ fluctuates at times, and a single test is of little value Retention in the blood of substances normally eliminated in the urine, on the other hand, gives direct insight into the eliminating and excreting power of the kidneys, and Bang's micromethod for nitrogen determination has made it possible to detect every degree of retention of nitrogen in the blood serum The details of a number of cases of nephritis are tabulated to illustrate the value of the findings in nephritis with and without uremia, compared with the rest nitrogen findings in 57 patients free from nephritis In the 12 cases of uremia, the residual nitrogen was in abnormal amounts, over 100 up to 289, in 11 of the cases, but it ranged only from 27 to 45 in one man of 38 He had hydremia, the albumin content being less than half the normal figure The case shows the necessity for estimating the proportion of water in the serum, as the dilution affects the proportion of nitrogen The uremia in this case was mild and soon subsided

When sodium chlorid is retained, it passes into the tissues and edema fluids, the proportion of sodium chlorid in transudates is often higher than in the blood But this does not occur with retained nitrogen, if the proportion of residual nitrogen in the blood is approximately normal, and there is no edema, the conclusion is justified that the kidney functioning is adequate for the needs of the moment Even with edema, the same conclusion is justified as the retention of fluids may be the result of causes other than insufficient kidney functioning In the 66 cases of nephritis without uremia, the residual nitrogen figure was normal in a number—that is, below 40 mg in 100 c c blood—but these were all cases of hydremia masking the retention, or else the nephritis was extremely mild In dubious cases, a test meal of considerable protein, comparing the figure for the residual nitrogen before, a few hours afterward and the next morning, will show at once the functional capacity of the kidneys There is no increase in the residual nitrogen in the healthy after a meal of 85 gm protein, but in one man of 26 with nephritis the figure more than doubled in about twelve hours, in another case, apparently as severe, the figure remained unchanged and recovery was soon complete This test proved particularly useful in distinguishing between albuminuria of the benign, orthostatic type and that due to actual nephritis

The fourth table gives the details of 57 patients with various affections but apparently sound kidneys The residual nitrogen was within normal range in all but a few The exceptions were one of the four infants, some patients with liver disease (the bile in the blood possibly explaining the increased nitrogen figure), and two patients without symptoms of nephritis, but necropsy revealed far advanced disease of the glomerular apparatus The more active metabolism in infants may render normal a high nitrogen content in the blood The further course of all the cases cited confirmed the reliability of the residual nitrogen findings as an index of kidney efficiency, especially of the functioning of the glomerular apparatus Even when the clinical picture includes albuminuria, tube casts and edema, if the residual nitrogen keeps within or close to normal range, we can conclude that the glomerular apparatus is intact and that the storm will blow over in time Some striking instances are related in which the prognosis was based on the persistingly normal residual nitrogen content of the blood serum, and reexamination some months later showed the urine and blood findings practically normal, no edema, and the blood pressure only slightly above normal

Scheel warns that the residual nitrogen content should be determined more than once as the figure may fluctuate with the amount of protein in the diet, and it may rise and fall abruptly with acute nephritis or acute exacerbations of chronic glomerular nephritis In chronic nephritis a rise in the residual nitrogen figure may be the only sign to warn of impending uremia In treatment, he recalls that Bang found that well fed rabbits bore without much harm induced nephritis to which the underfed invariably succumbed Good nourishment is indispensable in treatment of nephritis, and we must ascertain what the patient can tolerate and not impose unnecessary restrictions Retention of salt is easily determined from the urine salt content The amount of protein to be allowed in the diet can be estimated from the behavior of the residual nitrogen in the serum He suggests that it is a simple matter to send a specimen of serum to a laboratory for examination

The residual nitrogen in itself does not seem to be responsible for any special symptoms, but serves merely as an index of the toxemia and its degree It may sound the warning before the toxemia has begun to induce symptoms The 155 cases on which Scheel's conclusions are based are particularly instructive as many of them were under prolonged observation, the ultimate course confirming the conclusions drawn on the basis of the proportion of the residual nitrogen retained in the blood He says that he has been working for nearly two years with Bang's new method although Bang did not publish it until December 1915 (*Biochemische Zeitschrift, lxxii*) It is on the same principle as his micromethod for determination of the sugar in the blood The blood or serum is dropped on paper and a precipitating fluid is applied to the paper This precipitates the precipitable elements in the blood while the nonprecipitable diffuse into the fluid Bang at first used mercuric chlorid for the precipitating fluid but found that phosphomolybdic acid precipitates the albumin more perfectly His formula for the solution is 0 5 per cent phosphomolybdic acid, 1 5 per cent sulphuric acid, and 0 5 per cent sodium sulphate
